J. L. KELLER (Dayton, University, OH) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 269-276. refs

A computer-generated Specific Clear-air Turbulence Risk (SCATR) index which may be instrumental in clear-air turbulence (CAT) detection is presented. The CAT phenomenon is most frequently found near the tropopause within jet stream/internal fronts associated with active extratropical cyclones. The SCATR index is formulated on the notion that while CAT is a subgrid-scale phenomenon in terms of what an aircraft experiences during an encounter, outbreaks of CAT are attributed to larger, grid-scale dynamical processes. The results of case studies suggest that this index provides a CAT forecast that is significantly better than those provided by traditional, subjective indices. Practical SCATR index applications include both short- and medium-range forecasts of CAT; numerical values may be used in flight-path optimization programs and flight-simulation software. In addition, this index may eventually incorporate other effects, such as terrain, which are important in determining the formation and potential intensity of CAT regions more accurately. K.K.

### USE OF COMPUTER TECHNOLOGY IN THE OPERATIONS OF THE NATIONAL AVIATION WEATHER ADVISORY UNIT

M. D. MATHEWS (NOAA, National Severe Storms Forecast Center, Kansas City, MO) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 285-288. refs

The application of computer technology to aviation forecasting is discussed. The area forecasts contain information on hazards, the position and movement of synoptic features, icing, turbulence, and the clouds and weather. The four computer systems utilized by the in-flight meteorologists are (1) the Advanced Operating System, (2) the Automation of Field Operations and Services, (3) the Weather Message Switching Center, and (4) the Centralized Storms Information Systems. The development of pilot weather reports on icing, turbulence, and clouds and weather from the computer data is described. I.F.

### UPPER AIR FORECASTING FOR AVIATION IN THE UNITED STATES

R. STEINBERG (NASA, Lewis Research Center, Cleveland, OH) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 289-294. refs

It is shown that the present forecast models used in the aviation digital forecast (ADF) product for automated flight planning in the U.S. did not improve in accuracy and precision over the past two decades. A new approach to the upper air forecasting is presented in the NASA/NOAA MERIT project. In MERIT, a concept of a tailored analysis is used, based on a high density automated aircraft report database (including radiosonde and satellite data), producing an accurate and precise description of the initial state of the atmosphere, and a relatively simple forecast model to move the forecast forward in time. The steadily updated 2-12 h forecasts provided every 3 h will be more efficient and accurate than the present 18 and 24 h forecasts provided every 12 hours. I.S.

**THE AVIATION WEATHER FORECASTING TASK FORCE - ASSESSING THE CURRENT SYSTEM**

J. MCCARTHY and P. J. OROURKE (National Center for Atmospheric Research, Boulder, CO) IN: International Conference on the Aviation Weather System, 2nd, Montreal, Canada, June 19-21, 1985, Preprints . Boston, MA, American Meteorological Society, 1985, p. 310-315. NSF-sponsored research.
(Contract DOT-FA01-84-Z-02051)

The objectives of the Aviation Weather Forecasting Task Force that was developed to identify weather problems in the aviation industry are discussed. The need for the formation of automatic aircraft report data bases to include wind, temperature, and turbulence observations, and for more accurate numerical forecast and warning products is examined. Methods of improving aviation meteorological training, pilot weather reports, and private weather services are studied. I.F.

**AERODYNAMIC CHARACTERISTICS OF AN OSCILLATING AIRFOIL**

R. H. WICKENS (National Aeronautical Establishment, Low Speed Aerodynamics Laboratory, Ottawa, Canada) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 32, March 1986, p. 34-49. refs

Results are reported from wind tunnel tests to study the effects of dynamic aerodynamics on the efficiency of a NACA 0018 airfoil used on a Darreius vertical axis wind turbine (VAWT). The topic is of interest because of uncontrolled pitching which occurs during operation and which produces stall, turbulence and separation effects that reduce efficiency. Present stream-tube theory and axial momentum models are not applicable in the unstable regimes. The wind tunnel tests were conducted with a 45 m/sec flow with an Re of 1.5 million. The situation mimicked typical wind turbine operational conditions. The airfoil was mounted on a hydraulic actuator to allow it to rotate about its quarter-chord location and to control the extent and frequency of oscillations. Data were also gathered on the performance in a steady flow for comparative purposes. Summary data are provided on the static and total pressures over a complete cycle of oscillation, and related to the angles of attack, time of onset of stall, and the lift and drag coefficients. The limitations of the study with regard to the absence of consideration of the flow acceleration experienced by an advancing blade are noted. M.S.K.

**A MICROCOMPUTER POLLUTION MODEL FOR CIVILIAN AIRPORTS AND AIR FORCE BASES**

H. M. SEGAL, J. K. KEMP, and P. L. HAMILTON Dec. 1985 55 p
(AD-A163232; FAA-EE-85-4; AFESC/ESL-TR-85-41) Avail: NTIS HC A04/MF A01 CSCL 09B

Over the past five years, the Federal Aviation Administration and the United States Air Force have developed a number of user-friendly emissions and dispersion models for air quality assessment purposes. The first, Simplex A was completed in July 1981. The second, called Emissions and Dispersion Modeling System (EDMS), has just been completed and this report constitutes its User's Guide. First, this User's Guide shows how the EDMS system evolved from the earlier, more complex AVAP and AQAM systems. Then, it identifies the hardware and software required to run the system and provides instructions on how to add, delete or change standard information. Finally, through a 125-step example problem, it instructs the user on how to input and process data to produce: (1) an emissions inventory of all sources at an airport/airbase, and (2) an estimate of the concentrations of these sources at specified locations. An inexperienced user should be able to process the example problem in less than three hours. Author (GRA)

**PROFILES OF TEMPERATURE AND DENSITY BASED ON EXTREMES AT 5, 10, 20, 30 AND 40 KM**

A. J. KANTOR, P. TATTELMANN, and F. A. MARCOS *In* International Council of Scientific Unions Handbook for MAP, Vol. 18 4 p Dec. 1985
Avail: NTIS HC A23/MF A01; also available from SCOSTEP Secretariat, Illinois Univ., 1406 West Green Street, Urbana, Ill. 61801 CSCL 04A

Information on the vertical distribution of expected extremes of temperature and density are required for the design and operation of systems traversing the atmosphere. Such data are particularly important at altitudes from the surface to approximately 80 km for developing all types of airborne vehicles ranging from helicopters and airplanes to sophisticated aerospace systems. Vertical profiles of temperature and density have been developed based on 1- and 10-percent hot and cold temperatures and 1- and 10- percent high and low densities occurring during the most severe month at the worst locations for which reliable upper-air data are available. The model profiles, from the surface to 80 km, are based on extremes that occur at 5, 10, 20, 30, and 40 km. There are 20 profiles for extreme temperatures (5 levels by 4 percentiles) that include associated densities, and 20 analogous profiles for extreme densities including associated temperatures. Consequently, a set of realistic profiles (rather than envelopes) of temperature and density, associated with extremes at each of 5 specified levels in the troposphere and stratosphere, are now available for altitudes up to 80 km. **AIRBORNE LIDAR MEASUREMENTS OF EL CHICHON STRATOSHPERIC AEROSOLS**

M. P. MCCORMICK and M. T. OSBORN (SASC Technologies, Inc., Hampton, Va.) Jul. 1982 49 p Supersedes NASA-RP-1136 NASA-RP-1148
(NASA-RP-1166; L-16107; NAS 1.61:1166) Avail: NTIS HC A03/MF A01 CSCL 04A

A NASA Electra airplane outfitted with a lidar system was flown in July 1982 between the latitudes of 42 deg. N and 12 deg. N. The primary purpose of this mission was to determine the spatial distribution and aerosol characteristics of the El Chichon-produced stratospheric material. This report presents the lidar data from that flight mission. Representative profiles of lidar backscatter ratio, plots of the integrated backscattering function versus latitude, and contours of backscatter mixing ratio versus altitude and latitude are given. In addition, tables containing numerical values of the backscatter ratio and backscattering functions versus altitude are supplied for each profile. The largest amount of material produced by the El Chichon eruptions of late March-early April 1982 which was measured by this flight resided south of 30 deg. N and was concentrated above 21 km in a layer that peaked at 24 to 27 km. In this latitude region, peak backscatter ratios at a wavelength of 0.6943 microns were approximately 50, and peak optical depths were calculated to be 0.2. This report presents the results of this mission in a ready-to-use format for atmospheric and climatic studies. Author

**MINIMUM OPERATIONAL PERFORMANCE STANDARDS FOR AIRBORNE THUNDERSTORM DETECTION EQUIPMENT**
May 1986 75 p
(RTCA/DO-191) Avail: NTIS HC A04/MF A01

Minimum operational performance standards for non-radar airborne thunderstorm detection equipment are explained in this document. These standards specify system characteristics that should be useful to designers, manufacturers, installers and users of the equipment. Information needed to understand the rationale for equipment characteristics and requirements is given. Typical equipment applications and operational goals as envisioned by Special Committee 154 are discussed. The minimum performance standards for the equipment are given. These standards specify the required performance under standard and environmental conditions. Also included are recommended bench test procedures necessary to demonstrate equipment compliance with the stated minimum requirements. Tests for the installed equipment are included when performance cannot be adequately determined through bench testing. The operational performance characteristics for equipment installations are described and conditions that will assure the equipment is used properly in the expected operational environment are defined. **ANALYSIS OF DIRECT AND NEARBY LIGHTNING STRIKE DATA FOR AIRCRAFT Final Report**
D. V. GIRI, R. S. NOSS, D. B. PHUOC, and F. M. TESCHE Jun. 1983 205 p
(Contract NAS1-16893)
(NASA-CR-172127; NAS 1.26:172127) Avail: NTIS HC A10/MF A01 CSCL 04B

A method for interpreting direct strike and nearby strike lightning data on aircraft is discussed. The theoretical basis for the interpretation involves a transmission line model for the aircraft, and is discussed. Results of applying this model to the F-106 aircraft are presented and in the natural resonances are computed for several different electrical representations of the aircraft. The signal processing techniques useful for extracting pole (resonance) information from experimental data are discussed, and the use of these techniques on the measured lightning data is illustrated. Finally, the results of a related ground-based lightning experiment are discussed and data are presented. The purpose of this test was to gain additional understanding of the resonance properties of the F-106 aircraft. Author

**TECHNIQUES FOR OPTIMIZING COMPUTER PERFORMANCE IN REAL-TIME FLIGHT SIMULATION**
R. M. HOWE (Michigan, University, Ann Arbor) IN: Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 . San Diego, CA, Society for Computer Simulation, 1986, p. 1-12.

The dynamic performance of real-time flight simulators is often limited by inherent delays in both input and output interfaces with the computer. For example, an output interface consisting of D to A converters using zero-order extrapolation introduces the equivalent of a half-frame delay. In this paper it is shown how, by operating the simulation at a computer frame rate that is less than the maximum possible frame rate, the effect of the D to A lag and other interface delays can be completely eliminated. Additional improvements in performance can be realized by A to D sampling of continuous inputs to the simulation at a frame rate which is a multiple of the overall integration frame rate used in the digital simulation. Frequency-domain techniques are used for quantitative analysis of the dynamic accuracy of each of these interface-compensation methods. The results are compared with the dynamic performance when no compensation is used, or when more traditional compensation methods are employed. Author

**CGI DELAY COMPENSATION**
R. E. MCFARLAND (NASA, Ames Research Center, Moffett Field, CA) IN: Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 . San Diego, CA, Society for Computer Simulation, 1986, p. 231-262. refs

Computer-generated graphics in real-time helicopter simulation produces objectionable scene-presentation time delays. In the flight simulation laboratory at Ames Research Center, it has been determined that these delays have an adverse influence on pilot performance during agressive tasks such as nap of the earth (NOE) maneuvers. Using contemporary equipment, computer generated image (CGI) time delays are an unavoidable consequence of the operations required for scene generation. However, providing that magnitude distortions at higher frequencies are tolerable, delay compensation is possible over a restricted frequency range. This range, assumed to have an upper limit of perhaps 10 or 15 rad/sec, conforms approximately to the bandwidth associated with helicopter handling qualities research. A compensation algorithm is introduced here and evaluated in terms of tradeoffs in frequency responses. The algorithm has a discrete basis and accommodates both a large, constant transport delay interval and a periodic delay interval, as associated with asynchronous operations. Author

**DECOUPLING OF NONLINEAR SYSTEMS, NONCOMMUTATIVE GENERATRIX SERIES, AND LIE ALGEBRAS [DECOUPLAGE DES SYSTEMES NON LINEAIRES, SERIES GENERATRICES NON COMMUTATIVES ET ALGEBRES DE LIE]**

D. CLAUDE (CNRS, Laboratoire des Signaux et Systemes, Gif-sur-Yvette, France) SIAM Journal on Control and Optimization (ISSN 0363-0129), vol. 24, May 1986, p. 562-578. In French. refs

The joint use of noncommutative generating power series and Lie algebras gives an algebraic approach for decoupling problem of nonlinear systems. A coherent decoupling method is produced using the additional notion of the immersion of a system into another, a concept which makes clear the fact that two systems have the same input-output behavior. Thus, a judicious choice of feedback which gives decoupling is able to immerse a system into a system defined on R super eta, with eta depending on the characteristic numbers of the system. Author

**TECHNIQUES FOR SORTIE GENERATION ANALYSIS**

J. A. SHIMIZU, N. CHANG, and R. S. MORRIS (Northrop Corp., Aircraft Div., Hawthorne, CA) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 18 p.
(SAE PAPER 851950)

The force effectiveness of tactical fighter units in meeting enemy threats is largely dependent on the aircraft capability to generate sorties. Sortie generation is a function of aircraft inherent design characteristics, operating conditions, and the quantity and availability of support resources. This paper examines a technique for analyzing the impact of these constraints and their interrelationships. The technique presented offers a practical approach for evaluating various operational and support policies by measuring their effect on the system's sortie generation capability. More importantly, the technique provides an important tool for evaluating the impact of design characteristics (particularly reliability and maintainability) on combat capability where the performance measure is, again, sortie generation capability. **AN EFFICIENT DECISION-MAKING-FREE FILTER FOR PROCESSES WITH ABRUPT CHANGES**

H. A. P. BLOM 10 Sep. 1984 10 p Presented at 7th IFAC Symposium on Identification and System Parameter Estimation, York, England, 3-7 Jul. 1985
(NLR-MP-84080-U; B8578435; ESA-86-96970) Avail: NTIS HC A02/MF A01

The system of linear stochastic difference equations with Markovian coefficients was generalized to cover processes in R sup n which jump simultaneously with the coefficients. The additional modeling potential of this generalized system is illustrated. For filtering partial observations of the generalized system, the Interacting Multiple Model (IMM) algorithm is given. It consists of a bank of N interacting Kalman-like filters which cooperate with a filter for the N state Markov process and is free of any decision making mechanism. Comparisons with other algorithms for processes with abrupt changes show that the IMM algorithm performs very well at the cost of a relatively low computational load. Due to the generalization, the IMM algorithm is a serious competitor of decision directed filters for processes in R sup n with additive jumps. ESA

**FLIGHT SIMULATION MOTION-BASE DRIVE ALGORITHMS. PART 2: SELECTING THE SYSTEM PARAMETERS**

L. D. REID and M. A. NAHON May 1986 231 p Sponsored by tyhe Canadian Transportation Development Centre
(UTIAS-307; ISSN-0082-5255) Avail: NTIS HC A11/MF A01

A project aimed at developing and testing flight simulator motion-base drive algorithms suited for commercial jet transports is discussed. Full six degrees-of-freedom motion of a synergistic motion-base is being studied. Three forms for these algorithms are being considered: (1) classical linear washout, (2) optimal control, and (3) coordinated adaptive washout. It is felt that the latter two techniques may provide some advantages over the classical, which is currently employed in most commercial flight simulators. A filter parameter selection process using typical jet transport maneuvers as input signals is discussed. The filter parameters were adjusted to produce a range of washout characteristics. The pilot's motion sensations produced by these tests were estimated through the use of linear models of the human vestibular system. Nine sets of washout filters were generated for future evaluation by a group of pilots. Computer listings of the real-time software are presented along with numerous test results. Author

(Contract NAG3-232)
(NASA-CR-177280; NAS 1.26:177280) Avail: NTIS HC A04/MF A01 CSCL 09B

The research reported in this paper was occasioned by the requirements on part of the Real-Time Digital Simulator (RTDS) project under way at NASA Lewis Research Center. The RTDS simulation scheme employs a network of CPUs running lock-step cycles in the parallel computations of jet airplane simulations. Their need for a high order language (HOL) that would allow non-experts to write simulation applications and that could be implemented on a possibly varying network can best be fulfilled by using the programming language Ada. We describe how the simulation problems can be modeled in Ada, how to map a single, multi-processing Ada program into code for individual processors, regardless of network reconfiguration, and why some Ada language features are particulary well-suited to network simulations. Author

**FLIGHT EFFECTS ON NOISE FROM COAXIAL DUAL FLOW. I - UNHEATED JETS**

R. DASH (NASA, Ames Research Center, Moffett Field, CA) AIAA Journal (ISSN 0001-1452), vol. 24, May 1986, p. 761-769. Previously announced in STAR as N83-17238. refs
(Contract NCC2-75)

The effects of flight on sound radiated from embedded, uncorrelated ring sources convecting along the midst of the primary and the secondary streams of a coaxial dual flow which emerges from a moving nozzle into the ambience are studied. Cold jets are examined. The problem is posed as a double vortex-sheet flow model which involves deliberate suppression of inherent instabilities of the flow and is formulated, as a linear problem, in terms of the combined contributions of two independent uncorrelated quadrupole-type ring sources, the one convecting in the primary flow representing the sources generated due to the interaction at the primary/secondary interface and the other convecting in the secondary flow representing the sources generated due to the interaction at the secondary/ambient interface. The analysis shows that the effects of flight induce: (1) amplication of noise in the forward quadrant, (2) reduction of noise in the aft quadrant and (3) absolutely no impact on radiation of noise at Theta = 90 deg to the jet axis. Author

**FLIR, NVG AND HMS/D SYSTEMS FOR HELICOPTER OPERATION: REVIEW**

H. D. V. BOEHM *In* AGARD Visual Protection and Enhancement 27 p Dec. 1985 refs
Avail: NTIS HC A11/MF A01

In the last decade, electro-optical systems have been used successfully in military and civil applications. They extend the scope of operation of ground vehicles, helicopters and fixed wing aircraft from daytime into nighttime, with a 24 hour readiness covering even bad weather conditions. The visual aids fall into two physical categories: the image intensifiers, which amplify reflected residual light in the near infrared and the thermal imager, which detect the thermal radiation of all bodies mainly in the 8 to 12 micrometer atmospheric window for bodies with T approx. 20 C. During the last five years, the investigator has carried out helicopter flight trials at night using examples of all these visionic aids (FLIR, LLLTV, NVG, HMS/D and Direct View Optics) for piloting and observation tasks. The detection, recognition and identification range of nine different FLIR were tested in ground and laboratory tests. The evaluation of an optical sensor platform location in the helicopter nose-, roof- and mast-mounted versions, the comparison of thermal and intensifier images and the NVG compatible cockpit were topics of the tests. The optical sensors are described with their limitations and some results of the trials are given, with regard to the pilot's stress situation and eye safety. Author

Federal Aviation Regulation (FAR) Part 36 requires the reporting of turbojet and large transport category aircraft certificated noise levels in units of Effective Perceived Noise Level in decibels. Many airport and other community noise analyses utilize a noise rating scale that is based upon A-weighted decibels. For this reason, A-weighted noise levels for aircraft under FAR Part 36 conditions were estimated to provide a reference source for aircraft noise levels that is consistent with the many noise rating scales having A-weighted noise level as the basic measurement. Listings of estimated aircraft noise levels in units of A-weighted sound level in decibels, ranked in descending order are presented. This information is provided both for aircraft that were noise type certificated under FAR Part 36 and for aircraft for which no such requirement currently exists. Author

**SPECTRA OF NOISE AND AMPLIFIED TURBULENCE EMANATING FROM SHOCK-TURBULENCE INTERACTION: TWO SCENARIOS**
H. S. RIBNER Mar. 1986 40 p Sponsored by the Natural Sciences and Engineering Research Council of Canada Prepared in cooperation with Toronto Univ. (Ontario)
(NASA-TM-88766; NAS 1.15:88766; UTIAS-TN-260; ISSN-0082-5263) Avail: NTIS HC A03/MF A01 CSCL 20A

This work is a small extension of NACA studies of the early fifties that predicted amplification of turbulence on passing through a shock wave (observed for turbulent boundary layers), as well as the generation of intense noise (observed for supersonic jets). The first solved the basic gasdynamics problem of the interaction of an infinite planar shock with a single three-dimensional spectrum component of turbulence (an oblique sinusoidal shear wave). The second developed the comprehensive 3D spectrum analysis necessary to generalize the scenario to the interaction of a shock wave with convected homogeneous turbulence. Numerical calculations were carried out to yield curves (vs. Mach number) of rms sound pressure, temperature fluctuation, and two components of turbulent velocity downstream of the shock, for two cases of preshock turbulence. The present numerical study reproduces these for one case and provides in addition their one-dimensional power spectra (vs. wavenumber or frequency). Ratios of the several postshock spectra to the longitudinal preshock turbulence spectrum (1D) have been computed for a wide range of Mach numbers; curves vs. wavenumber are presented for two scenarios of preshock turbulence: isotropy and axisymmetry, both based on the von Karman 3D spectrum. **ANALYSIS OF HELICOPTER NOISE DATA USING INTERNATIONAL HELICOPTER NOISE CERTIFICATION PROCEDURES**
J. S. NEWMAN, E. J. RICKLEY, D. A. LEVANDUSKI, and S. B. WOOLRIDGE Mar. 1986 282 p Prepared in cooperation with Operations Research, Inc., Rockville, Md.
(PB86-186533; FAA-EE-86-01) Avail: NTIS HC A13/MF A01 CSCL 20A

The results of a Federal Aviation Administration (FAA) noise measurement flight test program involving seven helicopters are documented. Noise levels were established using the basic testing, reduction and analysis techniques specified by the International Civil Aviation Organization (ICAO) for helicopter noise certification, supplemented with some procedural refinements contained in ICAO Working Group II recommendations for incorporation into the standard. **DEVELOPMENTS IN AIRWORTHINESS CONTROL FOR CANADIAN AIRLINES**
J. F. HAINES (Air Canada, Montreal) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 6 p.
(SAE PAPER 851784)

Changes in the control of aeronautics in Canada are discussed. The objectives and capabilities of the continuous maintenance system and the design approval representative system are described. The development of and requirements for the maintenance development program, which contains quality and engineering organizations, and an approved airworthiness engineering organization are examined. I.F.

**AIRCRAFT GROUND SUPPORT EQUIPMENT STANDARDIZATION - THE PROS AND CONS OF 'FUNCTIONAL' VS 'TECHNICAL' STANDARDIZATION**
J. J. MACHON (Air France, Paris) SAE, Aerospace Technology Conference and Exposition, Long Beach, CA, Oct. 14-17, 1985. 14 p.
(SAE PAPER 851794)

The main international bodies currently active in the fields of aircraft Ground Support Equipment (GSE) standardization are discussed, and an attempt is made to define what standardization should or should not be in this field. The activities of the ISO, SAE, and IATA are described, and their interlinks are shown. The classes of 'technical' standardization, which concerns design type specifications and purchasing type specifications, are addressed. The meaning of 'functional' specification, and how in practice it leads to a fairly effective worldwide GSE standardization, is considered. The way in which the market may respond to technical and functional standardization is discussed. C.D.

**INVESTIGATIONS IN THE HISTORY AND THEORY OF THE DEVELOPMENT OF AVIATION AND SPACE SCIENCE AND TECHNOLOGY. NUMBER 4 [ISSLEDOVANIIA PO ISTORII I TEORII RAZVITIIA AVIATSIONNOI I RAKETNO-KOSMICHESKOI NAUKI I TEKHNIKI. NUMBER 4]**
B. V. RAUSHENBAKH, ED. Moscow, Izdatel'stvo Nauka, 1985, 256 p. In Russian. No individual items are abstracted in this volume.

Papers on three main topics are presented. The first topic is a review of the history of the first 25 years of Soviet space flight. The second topic is a consideration of the history and development of aviation science and technology, with particular emphasis on aircraft design. The third topic is the Soviet manned space flight program during 1961-1981, with particular emphasis on the development of solid rocket engines. B.J.

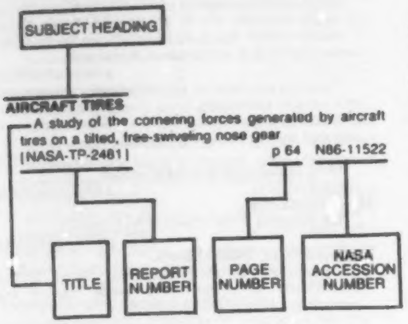
### Typical Subject Index Listing



**The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.**

**AIR POLLUTION**
Aircraft engine emissions estimator
[AD-A164552] p 616 N86-26715

**AIR QUALITY**
A microcomputer pollution model for civilian airports and Air Force bases
[AD-A163232] p 616 N86-26714

**AIR TO AIR MISSILES**
Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet
[NASA-CR-178097] p 587 N86-27278

**AIR TRAFFIC CONTROL**
The FAA/M.I.T. Lincoln Laboratory Doppler Weather Radar program p 614 A86-37461

Evaluation of the ASR-9 weather reflectivity product --- airport surveillance radar p 614 A86-37485

The aviation weather forecasting task force - Assessing the current system p 616 A86-37504

Air traffic control (ATC) and vessel traffic systems (VTS) p 572 A86-39556

Integrated risk/cost planning models for the US Air Traffic system
|NASA-CR-177274| p 573 N86-26312

Microwave Landing System (MLS) station interface control report
|DOT/FAA/PM-86/17| p 540 N86-27178

An optimization model for the US Air-Traffic System
|NASA-CR-177277| p 574 N86-27271

TCAS Experimental Unit (TEU) hardware description
|FAA/PM-85/2| p 574 N86-27272

**AIRBORNE EQUIPMENT**

The Phoenix sensor turret system
p 586 A86-37342

Applications of sensor payloads p 586 A86-37343

Installation of a bleed air heated radome/air motion sensing system on a Beech King Air 200 aircraft
|SAE PAPER 851811| p 589 A86-38322

Simulation and analysis of antennas radiating in a complex environment p 572 A86-39535

Minimum operational performance standards for airborne thunderstorm detection equipment
|RTCA/DO-191| p 617 N86-27851

**AIRBORNE/SPACEBORNE COMPUTERS**

Avionics system architecture for Beechcraft Starship 1
|SAE PAPER 851851| p 589 A86-38346

Pilot's Associate - What should it do? --- pilot and airborne computer task allocations
|SAE PAPER 851890| p 539 A86-38356

**AIRCRAFT ACCIDENT INVESTIGATION**

Terrain-induced wind shear - Potential cause of Jetstar accident p 566 A86-37482

The crash of C-GTLA - The cumulative effects of small defects and a hint of a previously unrocognized major meteorological hazard p 567 A86-37489

**AIRCRAFT ACCIDENTS**

The risk to third party personnel from RPV operations
p 566 A86-37327

Wind shear studies and cockpit integration
|SAE PAPER 851812| p 593 A86-38323

Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 3 of 1984 accidents
|PB85-916922| p 570 N86-26303

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 4 of 1984 accidents
|PB85-916923| p 570 N86-26304

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 5 of 1984 accidents
|PB86-916901| p 570 N86-26305

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 6 of 1984 accidents
|PB86-916902| p 570 N86-26306

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 7 of 1984 accidents
|PB86-916903| p 570 N86-26307

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 8 of 1984 accidents
|PB86-916904| p 570 N86-26308

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 9 of 1984 Accidents
|PB86-916905| p 570 N86-26309

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 11 of 1984 accidents
|PB86-916907| p 571 N86-26310

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 13 of 1984 accidents
|PB86-916909| p 571 N86-26311

National Transportation Safety Board safety recommendation
|NTSB-4102C/300A| p 571 N86-27267

Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 17 of 1983 accidents
|PB85-916918| p 571 N86-27269

**AIRCRAFT COMMUNICATION**

A technique to evaluate the accessibility of airborne receivers to interfering signals p 572 A86-37555

Simulation and analysis of antennas radiating in a complex environment p 572 A86-39535

**AIRCRAFT CONFIGURATIONS**

An analysis of elliptic grid generation techniques using an implicit Euler solver
|AIAA PAPER 86-1766| p 542 A86-37804

Euler solutions for aircraft configurations employing upper surface blowing (USB)
|AIAA PAPER 86-1767| p 542 A86-37805

Aerodynamics and radar-signature - A theoretical approach to estimate the radar-signature of complex aircraft configurations compatible with aerodynamic panel-methods
|AIAA PAPER 86-1770| p 577 A86-37807

Planform effects for low-fineness ratio multibody configurations at supersonic speeds
|AIAA PAPER 86-1799| p 544 A86-37825

PAN AIR analysis of a transport high-lift configuration
|AIAA PAPER 86-1811| p 544 A86-37832

Application of NCOREL to aircraft configurations --- CFD program
|AIAA PAPER 86-1830| p 577 A86-37843

EAP - Fighter blueprint p 577 A86-37939

Effects of jet flap on AV8-B 'Harrier' performance
|SAE PAPER 851843| p 579 A86-38340

Analytical study of three-surface lifting systems
|SAE PAPER 850866| p 552 A86-38507

Recent developments in the dynamics of advanced rotor systems. I p 586 A86-39597

Aircraft performance optimization with thrust vector control
|AD-A165388| p 587 N86-26334

Recent extensions to the free-vortex-sheet theory for expanded convergence capability p 556 N86-27194

Towards an advanced vortex flap system: The cavity flap p 557 N86-27200

Viscous vortical flow calculations over delta wings
p 558 N86-27202

Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247

Gust alleviation on a transport airplane
p 565 N86-27259

**AIRCRAFT CONSTRUCTION MATERIALS**

Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
|SAE SP-623| p 582 A86-38515

Ingot metallurgy aluminum - Lithium alloys for aircraft structure
|AIAA PAPER 86-0890| p 603 A86-38822

Operational experience of U.S. Air Force with structural composites
|AIAA PAPER 86-0946| p 583 A86-38840

Composite material service experience on Boeing commercial airplanes
|AIAA PAPER 86-0947| p 603 A86-38841

Crash energy absorbing composite sub-floor structure
|AIAA PAPER 86-0944| p 585 A86-38952

**AIRCRAFT CONTROL**

DIGITAC multimode control laws --- for military aircraft missions
|SAE PAPER 851826| p 594 A86-38332

USAF Test Pilot School use of DIGITAC in systems testing
|SAE PAPER 851827| p 594 A86-38333

Integrated braking and ground directional control for tactical aircraft
|SAE PAPER 851941| p 581 A86-38374

Design of a flutter mode controller using positive real feedback p 594 A86-39041

Summary of results of NASA F-15 flight research program
|NASA-TM-86811| p 539 N86-26277

Flight test guide for certification of transport category airplanes
|FAA-AC-25-7| p 587 N86-26329

Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339

Study on using a digital ride quality augmentation system to trim an engine-out in a Cessna 402B
|NASA-CR-177272| p 595 N86-26342

Failures in advanced flight control systems of future transport aircraft --- semisubmersible platform
|NLR-TR-84108-U| p 595 N86-26343

Towards an advanced vortex flap system: The cavity flap p 557 N86-27200

A self-organising control system for non-linear aircraft dynamics p 564 N86-27258

A computer programme for DATCOM methods of estimation of lateral stability and control derivatives
|NAL-TM-AE-8601| p 596 N86-27289

**AIRCRAFT DESIGN**

Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings and Supplementary Papers p 575 A86-37326

Canadair rotary wing, full scale engineering development. III p 575 A86-37330

P T A - Design considerations for an airframe system and detailed design of fuel subsystem --- Pilotless Target Aircraft p 590 A86-37331

Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers p 541 A86-37801

EAP - Fighter blueprint p 577 A86-37939

Hawk - The British fighting trainer
|SAE PAPER 851768| p 578 A86-38303

The EMB-312 Tucano - A Brazilian trainer
|SAE PAPER 851769| p 578 A86-38304

Swept wing-tip shapes for low-speed airplanes
|SAE PAPER 851770| p 546 A86-38305

X-wing - A low disc-loading V/STOL for the Navy
|SAE PAPER 851772| p 578 A86-38307

Computational aerodynamic design - X-29, the Gulfstream series and a tactical fighter
|SAE PAPER 851789| p 547 A86-38313

Optimization of a supersonic wing by combining linear and Euler methods
|SAE PAPER 851791| p 547 A86-38315

Leading-edge design for improved spin resistance of wings incorporating conventional and advanced airfoils
|SAE PAPER 851816| p 578 A86-38325

Requirements for future RALS/STOVL operating concepts --- Remote Augmented Lift System
|SAE PAPER 851840| p 578 A86-38337

The impact of technology on fighter aircraft requirements
|SAE PAPER 851841| p 579 A86-38338

A faster 'transition' to laminar flow
|SAE PAPER 851855| p 548 A86-38347

European aircraft steering systems
|SAE PAPER 851940| p 581 A86-38373

Interdependence of parameters important to the design of subsonic canard-configured aircraft
|SAE PAPER 850865| p 581 A86-38506

Preliminary design research for the Caravan 1 crew seat
|SAE PAPER 850856| p 582 A86-38514

Design and certification of a composite control surface
|SAE PAPER 850888| p 582 A86-38516

Time runs out for the clockwork cockpit
p 583 A86-38701

Aircraft wheel design and proving p 583 A86-38721

Influence of FBW - Control laws on structural design of modern transport aircraft --- fly by wire
|AIAA PAPER 86-0953| p 584 A86-38846

Integrated aeroservoelastic tailoring of lifting surfaces
|AIAA PAPER 86-1005| p 594 A86-38946

Research on the technology of an airplane concept for a Stationary High-Altitude Relay Platform (SHARP)
p 586 A86-39564

Proceedings of the Conference on Low Reynolds Number Airfoil Aerodynamics
|NASA-CR-177308| p 540 N86-26283

Vortex Flow Aerodynamics, volume 1
|NASA-CP-2416-VOL-1| p 556 N86-27190

Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253

Static aeroelasticity in combat aircraft
|AGARD-R-725| p 613 N86-27678

**AIRCRAFT DETECTION**

Aerodynamics and radar-signature - A theoretical approach to estimate the radar-signature of complex aircraft configurations compatible with aerodynamic panel-methods
|AIAA PAPER 86-1770| p 577 A86-37807

An terrain-aided guidance system with high convergence speed p 573 A86-39766

An efficient decision-making-free filter for processes with abrupt changes --- aircraft tracking
|NLR-MP-84080-U| p 618 N86-27018

**AIRCRAFT ENGINES**

Effects of section thickness and orientation on creep-rupture properties of two advanced single crystal alloys
|SAE PAPER 851785| p 601 A86-38309

Reliability and maintainability - A look at the Rolls-Royce RB.211
|SAE PAPER 851829| p 590 A86-38334

The STOL performance of a two-engine, USB powered-lift aircraft with cross-shafted fans
|SAE PAPER 851839| p 578 A86-38336

Harrier III-AV8B with a modern engine
|SAE PAPER 851881| p 579 A86-38349

The significance of advanced technology engines on V/STOL systems
|SAE PAPER 851882| p 579 A86-38350

A verification of propulsion and airplane performance models generated from flight
|SAE PAPER 851899| p 580 A86-38362

Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985
|SAE SP-633| p 607 A86-38526

Performance advantages of high load aviation lubricants
|SAE PAPER 851798| p 607 A86-38528

Flight effects on noise from coaxial dual flow. I - Unheated jets p 619 A86-39058

Surface layer activation technique for monitoring and in situ wear mearurement of turbine components p 591 A86-39086
Surge margin enhancement by a porous throat diffuser p 592 A86-39568
Gas and erosion corrosion of the combustion chambers of aircraft engines p 592 A86-39725
Aircraft engine emissions estimator |AD-A164552| p 616 N86-26715
Design, development and operation of a high simultaneous capacity digital telemetry system p 613 N86-27632

**AIRCRAFT EQUIPMENT**
A thermal imaging payload for RPV applications p 588 A86-37333
Lightning discharge protection rod |NASA-CASE-LAR-13470-1| p 589 N86-26296
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers |AD-A164828| p 569 N86-26298
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations |AGARD-CP-387| p 573 N86-26316
Synthetic real-time relief display all-weather airborne missions p 589 N86-26321
The wide field helmet mounted display p 589 N86-26322
A solid-state map display for rapid response operation p 589 N86-26323
Applications of digital terrain data in flight operations p 573 N86-26324
Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326
Minimum operational performance standards for airborne thunderstorm detection equipment |RTCA/DO-191| p 617 N86-27851

**AIRCRAFT FUEL SYSTEMS**
P T A - Design considerations for an airframe system and detailed design of fuel subsystem --- Pilotless Target Aircraft p 590 A86-37331

**AIRCRAFT FUELS**
Aviation fuels technology --- Book p 601 A86-38266
Evaluation of less toxic fuels for aircraft emergency power systems |SAE PAPER 851974| p 601 A86-38384
Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 |SAE SP-633| p 607 A86-38526
Development of a high temperature jet engine oil - Laboratory and field evaluation |SAE PAPER 851797| p 607 A86-38527
Development of the portable water separometer for the WSIM test |SAE PAPER 851870| p 608 A86-38537
The influence of JFTOT operating parameters on the assessment of fuel thermal stability --- Jet Fuel Thermal Oxidation Tester |SAE PAPER 851871| p 602 A86-38538
A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application p 591 A86-38994
Properties of aircraft fuels and related materials |AD-A164532| p 604 N86-27461

**AIRCRAFT GUIDANCE**
An terrain-aided guidance system with high convergence speed p 573 A86-39766
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations |AGARD-CP-387| p 573 N86-26316
A new technique for terrain following/terrain avoidance guidance command generation p 574 N86-26325
A mission navigation and control system for modern military helicopters p 574 N86-26327

**AIRCRAFT HAZARDS**
An aviation composite hazards product --- for meteoroloical radar observations p 566 A86-37469
The hazards of ash clouds to civil air transport p 566 A86-37477
Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation p 566 A86-37478
NASA storm hazards research in lightning strikes to aircraft p 566 A86-37479
Lightning measurements of an aircraft flying at low altitude p 567 A86-37490
The equivalent deterministic function of the Dryden's spectra of atmospheric turbulence and its application to the aircraft response problem p 595 A86-39768
Experimental measurements of heat transfer from an iced surface during artificial and natural cloud icing conditions |AIAA PAPER 86-1352| p 598 A86-39948
Flammability of aircraft hydraulic fluids: A bibliography |AD-A165463| p 569 N86-26299
Calibration of droplet sizing and liquid water content instruments: Survey and analysis |NASA-CR-175099| p 611 N86-26596

**AIRCRAFT HYDRAULIC SYSTEMS**
Nonflammable fluid and 8,000 psi technology for future aircraft hydraulic systems (22 CFR 125.4 /b/ /13/ applicable) |SAE PAPER 851909| p 580 A86-38364
Lightweight hydraulic system technology - 8000 psi update --- for military aircraft |SAE PAPER 851910| p 580 A86-38365
Hydraulic pumps for high pressure non-flammable fluids --- for aircraft |SAE PAPER 851911| p 580 A86-38366
8000 psi hydraulic system seals and materials test program - A progress report |SAE PAPER 851913| p 580 A86-38367

**AIRCRAFT INSTRUMENTS**
Processes for the manufacture of aviation instrument components (2nd revised and enlarged edition) --- Russian book p 610 A86-39979
A mission navigation and control system for modern military helicopters p 574 N86-26327

**AIRCRAFT LANDING**
Terrain-induced wind shear - Potential cause of Jetstar accident p 566 A86-37482
Aircraft Landing Dynamics Facility - A unique facility with new capabilities |SAE PAPER 851938| p 598 A86-38371
Integrated braking and ground directional control for tactical aircraft |SAE PAPER 851941| p 581 A86-38374
Fuel conservative guidance for shipboard landing of powered-lift STOL aircraft p 572 A86-39048
Validation of a new flying quality criterion for the landing task |NASA-TM-88261| p 595 N86-26341

**AIRCRAFT LAUNCHING DEVICES**
A new compressed air launching system p 596 A86-37337
The Phoenix air vehicle, its launch and recovery p 576 A86-37340
'A flywheel powered RPV launcher - Putting theory into practice' p 590 A86-37344
A spring in the air --- launching device for RPV p 590 A86-37345
The history and development of the repeatable release catapult holdback bar |SAE PAPER 851942| p 581 A86-38375

**AIRCRAFT MAINTENANCE**
Developments in airworthiness control for Canadian airlines |SAE PAPER 851784| p 620 A86-38308
Mechanical interface devices for automatic test equipment |SAE PAPER 851795| p 606 A86-38318
The F-16 aircraft and hydrazine - An industrial hygiene perspective |SAE PAPER 851971| p 568 A86-38381
An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures |AD-A165588| p 540 N86-26282

**AIRCRAFT MANEUVERS**
Accurate dynamic theory for supermaneuverable aircraft wings |AIAA PAPER 86-1006| p 585 A86-38947
Extraction of aerodynamic parameters for aircraft at extreme flight conditions p 563 N86-27248
Recent experiences of unsteady aerodynamic effects on aircraft flight dynamics at high angle of attack p 564 N86-27252
Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253
A self-organising control system for non-linear aircraft dynamics p 564 N86-27258
Application of CFD techniques toward the validation of nonlinear aerodynamic models p 565 N86-27265
Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters |UTIAS-307| p 618 N86-27929

**AIRCRAFT MODELS**
FAA structural crash dynamics program update - Transport category aircraft |SAE PAPER 851887| p 568 A86-38354
Vortex Flow Aerodynamics, volume 1 |NASA-CP-2416-VOL-1| p 556 N86-27190
Development, construction, and manufacturing of wind tunnel models for aerodynamic investigations |BMFT-FB-W-85-012| p 600 N86-27296
Analysis of direct and nearby lightning strike data for aircraft |NASA-CR-172127| p 617 N86-27855

**AIRCRAFT NOISE**
La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984 |ESA-TT-907| p 559 N86-27217
Helicopter noise p 560 N86-27223
Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241
Advisory Circular: Estimated airplane noise levels in A-weighted decibels |AC-36-3D| p 620 N86-27969
Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios |NASA-TM-88766| p 620 N86-27970
Analysis of helicopter noise data using international helicopter noise certification procedures |PB86-186533| p 620 N86-27972

**AIRCRAFT PARTS**
Flexible manufacturing system for the fabrication of precision components with real time simulation |SAE PAPER 851804| p 606 A86-38320
Aircraft wheel design and proving p 583 A86-38721
Ingot metallurgy aluminum - Lithium alloys for aircraft structure |AIAA PAPER 86-0890| p 603 A86-38822
Processes for the manufacture of aviation instrument components (2nd revised and enlarged edition) --- Russian book p 610 A86-39979
Analysis of direct and nearby lightning strike data for aircraft |NASA-CR-172127| p 617 N86-27855

**AIRCRAFT PERFORMANCE**
Douglas Automated Weighing System p 597 A86-38069
The EMB-312 Tucano - A Brazilian trainer |SAE PAPER 851769| p 578 A86-38304
Retrofitting avionics - Closing the performance 'Generation gap' |SAE PAPER 851813| p 589 A86-38324
The STOL performance of a two-engine, USB powered-lift aircraft with cross-shafted fans |SAE PAPER 851839| p 578 A86-38336
Estimation of lift losses of hovering vehicles using a single jet |SAE PAPER 851842| p 579 A86-38339
Effects of jet flap on AV8-B 'Harrier' performance |SAE PAPER 851843| p 579 A86-38340
A verification of propulsion and airplane performance models generated from flight |SAE PAPER 851899| p 580 A86-38362
Aircraft flotation analysis - Current methods and perspective --- of ground performance evaluation |SAE PAPER 851936| p 580 A86-38369
Techniques for sortie generation analysis |SAE PAPER 851950| p 618 A86-38376
Natural laminar flow and regional aircraft |SAE PAPER 850864| p 552 A86-38505
X-29A technology demonstrator flight test program overview |NASA-TM-86809| p 586 N86-26328
Aircraft performance optimization with thrust vector control |AD-A165388| p 587 N86-26334
Validation of a new flying quality criterion for the landing task |NASA-TM-88261| p 595 N86-26341
An overview of the fundamental aerodynamics branch's research activities in wing leading-edge vortex flows at supersonic speeds p 558 N86-27207

**AIRCRAFT PILOTS**
MLS - The pilot's point of view p 572 A86-39557

**AIRCRAFT POWER SUPPLIES**
Evaluation of less toxic fuels for aircraft emergency power systems |SAE PAPER 851974| p 601 A86-38384

**AIRCRAFT PRODUCTION**
Generation of an electroformed nickel mold for use in manufacturing composite parts |SAE PAPER 850905| p 607 A86-38523

**AIRCRAFT PRODUCTION COSTS**
How US companies are attacking production costs --- of aircraft p 605 A86-37323

**AIRCRAFT RELIABILITY**
Putting a price on safety p 567 A86-37940
Developments in airworthiness control for Canadian airlines |SAE PAPER 851784| p 620 A86-38308
Nonflammable fluid and 8,000 psi technology for future aircraft hydraulic systems (22 CFR 125.4 /b/ /13/ applicable) |SAE PAPER 851909| p 580 A86-38364
Flight test guide for certification of transport category airplanes |FAA-AC-25-7| p 587 N86-26329
Aircraft nuclear survivability methods |AD-A163218| p 587 N86-26332

National Transportation Safety Board safety recommendation
[NTSB-4102C/300A] p 571 N86-27267
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
[AD-A165235] p 599 N86-27295

**AIRCRAFT SAFETY**
Aerodynamics and radar-signature - A theoretical approach to estimate the radar-signature of complex aircraft configurations compatible with aerodynamic panel-methods
[AIAA PAPER 86-1770] p 577 A86-37807
Putting a price on safety p 567 A86-37940
Upper torso restraint systems --- for fixed wing and rotorcraft aircraft
[SAE PAPER 851848] p 567 A86-38344
Controlled impact demonstration review --- for aircraft crashworthiness evaluation
[SAE PAPER 851884] p 567 A86-38351
Antimisting fuel technology for transport category aircraft
[SAE PAPER 851886] p 568 A86-38353
FAA structural crash dynamics program update - Transport category aircraft
[SAE PAPER 851887] p 568 A86-38354
Design, safety, and maintainability aspects for hydrazine use in emergency secondary power systems
[SAE PAPER 851972] p 568 A86-38382
Data for the development of criteria for general aviation seat and restraint system performance
[SAE PAPER 850851] p 568 A86-38511
A procedure to evaluate aircraft crash floor pulses
[SAE PAPER 850854] p 582 A86-38513
Preliminary design research for the Caravan 1 crew seat
[SAE PAPER 850856] p 582 A86-38514
Safety report General Aviation Crashworthiness Project. Phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[PB85-917016] p 569 N86-26302
Analyses and tests for design of an electro-impulse de-icing system
[NASA-CR-174919] p 571 N86-27268
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 17 of 1983 accidents
[PB85-916918] p 571 N86-27269

**AIRCRAFT SPIN**
Leading-edge design for improved spin resistance of wings incorporating conventional and advanced airfoils
[SAE PAPER 851816] p 578 A86-38325

**AIRCRAFT STABILITY**
Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts p 615 A86-37497
A unified procedure for meeting power-spectral-density and statistical-discrete-gust requirements for flight in turbulence
[AIAA PAPER 86-1011] p 584 A86-38869
Summary of results of NASA F-15 flight research program
[NASA-TM-86811] p 539 N86-26277
Six degree-of-freedom LIVE isolation systems, part 1
[NASA-CR-177928] p 587 N86-26331
Study on using a digital ride quality augmentation system to trim an engine-out in a Cessna 402B
[NASA-CR-177272] p 595 N86-26342
Unsteady aerodynamics-fundamentals and applications to aircraft dynamics
[NASA-TM-88768] p 555 N86-27182
A computer programme for DATCOM methods of estimation of lateral stability and control derivatives
[NAL-TM-AE-8601] p 596 N86-27289

**AIRCRAFT STRUCTURES**
Aircraft icing observations and analysis
p 576 A86-37465
Process for adhesive bonding of metal skins to aircraft structures
[SAE PAPER 851805] p 606 A86-38321
The design of repairable advanced composite structures
[SAE PAPER 851830] p 606 A86-38335
Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
[SAE SP-623] p 582 A86-38515
Design and use of Kevlar in aircraft structures
[SAE PAPER 850893] p 583 A86-38520
A cementitious tooling/molding material - Room temperature castable, high temperature capable
[SAE PAPER 850904] p 607 A86-38522
Equivalent plate analysis of aircraft wing box structures with general planform geometry
[AIAA PAPER 86-0940] p 583 A86-38837
Operational experience of U.S. Air Force with structural composites
[AIAA PAPER 86-0946] p 583 A86-38840
Composite material service experience on Boeing commercial airplanes
[AIAA PAPER 86-0947] p 603 A86-38841
Optimum design of large structures with multiple constraints
[AIAA PAPER 86-0952] p 600 A86-38845
Generic aircraft ground operation simulation
[AIAA PAPER 86-0989] p 584 A86-38865
Dynamic interactions between active control systems and a flexible aircraft structure
[AIAA PAPER 86-0960] p 594 A86-38932
Effects of nonlinear damping on random response of beams to acoustic loading
[AIAA PAPER 86-1004] p 609 A86-38945
Accurate dynamic theory for supermaneuverable aircraft wings
[AIAA PAPER 86-1006] p 585 A86-38947
Next generation aircraft structures - The need for co-ordinated Canadian R & D programs
p 539 A86-39567
The Shock and Vibration Digest, volume 17, no. 8
[AD-A165115] p 612 N86-27471
Principles and applications of the Fokker bond tester --- flue gases
[ESA-86-96960] p 612 N86-27624
Optimized bolted joint
[NASA-CASE-LAR-13250-1] p 612 N86-27630

**AIRCRAFT SURVIVABILITY**
Controlled impact demonstration review --- for aircraft crashworthiness evaluation
[SAE PAPER 851884] p 567 A86-38351
Antimisting fuel technology for transport category aircraft
[SAE PAPER 851886] p 568 A86-38353
Safety report General Aviation Crashworthiness Project. Phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
[PB85-917016] p 569 N86-26302
Aircraft nuclear survivability methods
[AD-A163218] p 587 N86-26332

**AIRCRAFT TIRES**
The generation of tire cornering forces in aircraft with a free-swiveling nose gear
[SAE PAPER 851939] p 581 A86-38372

**AIRCRAFT WAKES**
Prospects for destructive self-induced interactions in a vortex pair due to sinusoidal disturbances --- of large transport aircraft wakes
[AIAA PAPER 86-1791] p 543 A86-37821
Recent extensions to the free-vortex-sheet theory for expanded convergence capability p 556 N86-27194

**AIRFOIL FENCES**
Basic studies on delta wing flow modifications by means of apex fences p 557 N86-27199

**AIRFOIL PROFILES**
Euler calculation for flow over a wing in ground effect
[AIAA PAPER 86-1765] p 542 A86-37803
A two-dimensional transonic aerodynamic design method
[AIAA PAPER 86-1793] p 543 A86-37823
Dynamic stall modeling of the NACA 0012 profile
p 559 N86-27222

**AIRFOILS**
Investigations of transonic trailing edge flows
p 541 A86-37192
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
Inviscid and viscous simulations of high angle of attack flows
[SAE PAPER 851820] p 548 A86-38328
A faster 'transition' to laminar flow
[SAE PAPER 851855] p 548 A86-38347
Experimental determination of the laminar separation bubble characteristics on an airfoil at low Reynolds numbers
[AIAA PAPER 86-1065] p 548 A86-38433
Transonic potential flow calculations by two artificial density methods
[AIAA PAPER 86-1084] p 549 A86-38446
Aerodynamic characteristics of an oscillating airfoil --- for Vertical Axis Wind Turbine p 616 A86-39566
Proceedings of the Conference on Low Reynolds Number Airfoil Aerodynamics
[NASA-CR-177308] p 540 N86-26283
Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil
p 560 N86-27228
Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations: Dynamic stall
p 561 N86-27231
Computational aspects of unsteady flows
p 561 N86-27232
Review of SMP 1984 Symposium on Transonic Unsteady Aerodynamics and its Aeroelastic Applications
p 561 N86-27236
Unsteady vortex airfoil interaction p 562 N86-27240
Bifurcation theory applied to aircraft motions
p 563 N86-27250
Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261
Modelling of the vortex-airfoil interaction
p 565 N86-27262
Structural tailoring of engine blades (STAEBL) theoretical manual
[NASA-CR-175112] p 592 N86-27283
Structural tailoring of engine blades (STAEBL) user's manual
[NASA-CR-175113] p 592 N86-27284

**AIRFRAME MATERIALS**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
[AD-A165289] p 603 N86-26384
Engineering property comparisons for 2324-T39 and 2024-T351 aluminum alloy plate --- semisubmersible platform
[NLR-TR-84021-U] p 603 N86-26429
The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression --- semisubmersible platform
[NLR-MP-85019-U] p 611 N86-26661
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform
[NLR-TR-84051-U] p 611 N86-26662

**AIRFRAMES**
P T A - Design considerations for an airframe system and detailed design of fuel subsystem --- Pilotless Target Aircraft p 590 A86-37331
Observations on compressive local buckling, postbuckling and crippling of graphite/epoxy airframe structure
[AIAA PAPER 86-0923] p 608 A86-38833

**AIRLINE OPERATIONS**
Developments in airworthiness control for Canadian airlines
[SAE PAPER 851784] p 620 A86-38308
Aircraft ground support equipment standardization - The pros and cons of 'functional' vs 'technical' standardization
[SAE PAPER 851794] p 620 A86-38317

**AIRPORTS**
Evaluating the new automated weather observing system p 615 A86-37491
The classify, locate, and avoid wind shear (CLAWS) project at Denver's Stapleton International Airport - Operational testing of terminal weather hazard warnings with an emphasis on microburst wind shear
p 615 A86-37495
Use of NDE to evaluate reflection cracking in airfield pavements
[AD-A164880] p 599 N86-27293

**AIRSPACE**
Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force
[AD-A164864] p 599 N86-26346
An optimization model for the US Air-Traffic System
[NASA-CR-177277] p 574 N86-27271

**AIRSPEED**
An application of the Carson cruise optimum airspeed - A compromise between speed and efficiency
[SAE PAPER 850867] p 582 A86-38508
Integrated aeroservoelastic tailoring of lifting surfaces
[AIAA PAPER 86-1005] p 594 A86-38946
Low airspeed envelope determination of the CH-139 Jet Ranger helicopter p 586 A86-39565

**ALGORITHMS**
TCAS Experimental Unit (TEU) hardware description
[FAA/PM-85/2] p 574 N86-27272
Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters
[UTIAS-307] p 618 N86-27929

**ALL-WEATHER AIR NAVIGATION**
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations
[AGARD-CP-387] p 573 N86-26316
Synthetic real-time relief display all-weather airborne missions p 589 N86-26321
The wide field helmet mounted display
p 589 N86-26322

**ALPHA JET AIRCRAFT**
Alpha Jet Training System single aircraft concept
[SAE PAPER 851766] p 598 A86-38301

**ALUMINUM**
Environmental and adhesive durability of aluminium-polymer systems protected with organic corrosion inhibitors p 601 A86-37708

Effect of crack growth rate variations on life predictions
|AIAA PAPER 86-0981| p 603 A86-38859

**ALUMINUM ALLOYS**
Ingot metallurgy aluminum - Lithium alloys for aircraft structure
|AIAA PAPER 86-0890| p 603 A86-38822
Fatigue behavior of Ti-6Al-4V powder metallurgy compacts p 603 A86-39617
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384
Engineering property comparisons for 2324-T39 and 2024-T351 aluminum alloy plate --- semisubmersible platform
|NLR-TR-84021-U| p 603 N86-26429
Effects of cladding and anodizing on flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys --- semisubmersible platform
|NLR-TR-85006-U| p 604 N86-26430
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform
|NLR-TR-84051-U| p 611 N86-26662
Constant amplitude and flight simulation of fatigue tests on adhesive bonded lap joint specimens of 2024-T3 sheet material --- semisubmersible platform
|NLR-TR-84090-U| p 612 N86-26663

**ALUMINUM GRAPHITE COMPOSITES**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384

**ANGLE OF ATTACK**
An investigation of improving high angle of attack performance and flap effectiveness of a configuration with delta wing by spanwise blowing
|AIAA PAPER 86-1777| p 542 A86-37811
Application of the vortex-lattice method to high-angle-of-attack subsonic aerodynamics
|SAE PAPER 851817| p 547 A86-38326
Inviscid and viscous simulations of high angle of attack flows
|SAE PAPER 851820| p 548 A86-38328
Pivotable strakes for high angle of attack control
|SAE PAPER 851821| p 593 A86-38329
Vortex flow hysteresis p 558 N86-27201
Preliminary results of unsteady blade surface pressure measurements for the SR-3 propeller
|NASA-TM-87352| p 559 N86-27213
Recent developments in rotary-balance testing of fighter aircraft configurations at NASA Ames Research Center
p 562 N86-27242
A self-organising control system for non-linear aircraft dynamics p 564 N86-27258

**ANNULAR DUCTS**
Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine
p 591 A86-38998

**ANNULAR NOZZLES**
Aircraft performance optimization with thrust vector control
|AD-A165388| p 587 N86-26334

**ANODIZING**
Effects of cladding and anodizing on flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys --- semisubmersible platform
|NLR-TR-85006-U| p 604 N86-26430

**ANOMALIES**
Aircraft liftmeter
|NASA-CASE-LAR-12518-1| p 590 N86-27280

**ANTARCTIC REGIONS**
The presence of the Trident III on Antarctica
p 573 A86-39562

**ANTENNA RADIATION PATTERNS**
Simulation and analysis of antennas radiating in a complex environment p 572 A86-39535

**ANTHROPOMETRY**
Human injury criteria relative to civil aircraft seat and restraint systems
|SAE PAPER 851847| p 567 A86-38343

**ANTIMISTING FUELS**
Controlled impact demonstration review --- for aircraft crashworthiness evaluation
|SAE PAPER 851884| p 567 A86-38351
Antimisting fuel technology for transport category aircraft
|SAE PAPER 851886| p 568 A86-38353

**APPLICATIONS PROGRAMS (COMPUTERS)**
Users guide: Steady-state aerodynamic-loads program for shuttle TPS tiles
|NASA-TM-85724| p 600 N86-27406

**ARCHITECTURE (COMPUTERS)**
Avionics system architecture for Beechcraft Starship 1
|SAE PAPER 851851| p 589 A86-38346

**ARMED FORCES (UNITED STATES)**
USAF Test Pilot School use of DIGITAC in systems testing
|SAE PAPER 851827| p 594 A86-38333
The General Electric F404 - engine of the RAAF's new fighter
|AD-A164562| p 592 N86-26338

**ARTIFICIAL INTELLIGENCE**
A demonstration expert system for implementing emergency procedures in a high-performance fighter aircraft
|MAE-1749| p 569 N86-26295

**ASHES**
The hazards of ash clouds to civil air transport
p 566 A86-37477
Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation
p 566 A86-37478

**ASPHALT**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
|AD-A163379| p 610 N86-26480

**ASYMMETRY**
Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339

**ATMOSPHERIC DENSITY**
Profiles of temperature and density based on extremes at 5, 10, 20, 30 and 40 km p 616 N86-27727

**ATMOSPHERIC SOUNDING**
Profiles of temperature and density based on extremes at 5, 10, 20, 30 and 40 km p 616 N86-27727

**ATMOSPHERIC TEMPERATURE**
Profiles of temperature and density based on extremes at 5, 10, 20, 30 and 40 km p 616 N86-27727

**ATMOSPHERIC TURBULENCE**
Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts p 615 A86-37497
A unified procedure for meeting power-spectral-density and statistical-discrete-gust requirements for flight in turbulence
|AIAA PAPER 86-10[illegible]1| p 584 A86-38869
The equivalent deterministic function of the Dryden's spectra of atmospheric turbulence and its application to the aircraft response problem p 595 A86-39768
Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247
Effects of aerodynamic lags on aircraft responses
p 564 N86-27257

**ATTACK AIRCRAFT**
Hawk - The British fighting trainer
|SAE PAPER 851768| p 578 A86-38303

**ATTITUDE (INCLINATION)**
The generation of tire cornering forces in aircraft with a free-swiveling nose gear
|SAE PAPER 851939| p 581 A86-38372

**ATTITUDE CONTROL**
Design features of automatic control system of D-4 RPV p 593 A86-37407

**AUTOCLAVES**
A cementitious tooling/molding material - Room temperature castable, high temperature capable
|SAE PAPER 850904| p 607 A86-38522

**AUTOMATIC CONTROL**
Design features of automatic control system of D-4 RPV p 593 A86-37407
Evaluating the new automated weather observing system p 615 A86-37491
Multi-input multi-output automatic design synthesis for performance and robustness p 618 A86-39034
Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339

**AUTOMATIC FLIGHT CONTROL**
A new technique for terrain following/terrain avoidance guidance command generation p 574 N86-26325

**AUTOMATIC TEST EQUIPMENT**
Douglas Automated Weighing System
p 597 A86-38069
A new approach to automated gas turbine engine testing p 597 A86-38070
Mechanical interface devices for automatic test equipment
|SAE PAPER 851795| p 606 A86-38318
Ground testing approach for the B-1B bomber
|SAE PAPER 851796| p 598 A86-38319

**AUTOMATIC WEATHER STATIONS**
The FAA Automated Weather Observing System (AWOS) p 613 A86-37459
Automation of surface observations program --- for improvement of meteorological services
p 614 A86-37460

**AUTOMATION**
ASTROS - An advanced software environment for automated design
|AIAA PAPER 86-0856| p 618 A86-38807

**AUTONOMY**
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236

**AUTOPSIES**
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298

**AUXILIARY POWER SOURCES**
Design, safety, and maintainability aspects for hydrazine use in emergency secondary power systems
|SAE PAPER 851972| p 568 A86-38382

**AVIONICS**
Retrofitting avionics - Closing the performance 'Generation gap'
|SAE PAPER 851813| p 589 A86-38324
The integrated digital avionics system for the F-20 Tigershark
|SAE PAPER 851850| p 589 A86-38345
Avionics system architecture for Beechcraft Starship 1
|SAE PAPER 851851| p 589 A86-38346

**AXISYMMETRIC FLOW**
Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660

**AZIMUTH**
Characteristics of synthetic aperture radars
p 610 A86-39683

## B

**B-1 AIRCRAFT**
Ground testing approach for the B-1B bomber
|SAE PAPER 851796| p 598 A86-38319

**BACKSCATTERING**
Airborne lidar measurements of El Chichon stratoshperic aerosols
|NASA-RP-1166| p 616 N86-27835

**BALLISTIC MISSILE DECOYS**
Aerospace knowledge magazine (selected articles)
|AD-A164720| p 539 N86-26278

**BALLISTICS**
Impact damage to composite structures
|AGARD-R-729| p 604 N86-27425

**BASE PRESSURE**
A hot air tunnel for base bleed experimentation
p 597 A86-38252

**BAYS (STRUCTURAL UNITS)**
Particulate contaminant relocation during shuttle ascent
|NASA-TM-87794| p 600 N86-27351

**BEAMS (SUPPORTS)**
Crash energy absorbing composite sub-floor structure
|AIAA PAPER 86-0944| p 585 A86-38952

**BEARINGS**
Electrochemical evaluation of corrosivity in turbine engine oils
|SAE PAPER 851867| p 602 A86-38534

**BEECHCRAFT AIRCRAFT**
Avionics system architecture for Beechcraft Starship 1
|SAE PAPER 851851| p 589 A86-38346

**BENDING**
Vortex-induced bending oscillation of a swept wing
|AIAA PAPER 86-1773| p 542 A86-37809

**BIODYNAMICS**
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298

**BLADE SLAP NOISE**
Preliminary results of unsteady blade surface pressure measurements for the SR-3 propeller
|NASA-TM-87352| p 559 N86-27213
Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241

**BLOWDOWN WIND TUNNELS**
Investigations of transonic trailing edge flows
p 541 A86-37192

**BLOWING**
Flow structure of lateral wing-tip blowing
|AIAA PAPER 86-1810| p 544 A86-37831

**BLUNT BODIES**
Transonic flow solutions on a blunt, finned body of revolution using the Euler equations
|AIAA PAPER 86-1082| p 549 A86-38445

**BODIES OF REVOLUTION**
The external drag of a simple axisymmetric body of revolution in subsonic and supersonic flow with variable mass flowthrough ratios
|AIAA PAPER 86-1828| p 545 A86-37842

Transonic flow solutions on a blunt, finned body of revolution using the Euler equations
|AIAA PAPER 86-1082| p 549 A86-38445
A method for the design of shock-free slender bodies of revolution p 554 A86-39054

**BODY-WING CONFIGURATIONS**
Wing and conical body of arbitrary cross-section combinations in supersonic flow
|AIAA PAPER 86-1826| p 545 A86-37841
Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter
|AIAA PAPER 86-1069| p 548 A86-38436
Unsteady transonic flow calculations for wing-fuselage configurations
|AIAA PAPER 86-0862| p 552 A86-38897

**BOEING AIRCRAFT**
Boeing Robotic Air Vehicle p 576 A86-37339
Composite material service experience on Boeing commercial airplanes
|AIAA PAPER 86-0947| p 603 A86-38841

**BOEING 720 AIRCRAFT**
NASA experiments onboard the controlled impact demonstration
|SAE PAPER 851885| p 568 A86-38352

**BOEING 727 AIRCRAFT**
Engineering applications of an advanced low-order panel method
|SAE PAPER 851793| p 547 A86-38316

**BOEING 737 AIRCRAFT**
PAN AIR analysis of a transport high-lift configuration
|AIAA PAPER 86-1811| p 544 A86-37832

**BOLTS**
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform
|NLR-TR-84051-U| p 611 N86-26662
Optimized bolted joint
|NASA-CASE-LAR-13250-1| p 612 N86-27630

**BOMBER AIRCRAFT**
Aerospace knowledge magazine (selected articles)
|AD-A164720| p 539 N86-26278

**BOUNDARY ELEMENT METHOD**
Developments in boundary element methods - 4 p 609 A86-38966

**BOUNDARY INTEGRAL METHOD**
Developments in boundary element methods - 4 p 609 A86-38966
The indirect boundary integral formulation for elliptic, hyperbolic and non-linear fluid flows p 553 A86-38971

**BOUNDARY LAYER EQUATIONS**
A direct and inverse boundary layer method for subsonic flow over delta wings p 557 N86-27195
Viscous vortical flow calculations over delta wings p 558 N86-27202
Computational aspects of unsteady flows p 561 N86-27232
Unsteady airload computations for airfoil oscillating in attached and separated compressible flow p 561 N86-27238

**BOUNDARY LAYER FLOW**
Experimental determination of the laminar separation bubble characteristics on an airfoil at low Reynolds numbers
|AIAA PAPER 86-1065| p 548 A86-38433
A direct and inverse boundary layer method for subsonic flow over delta wings p 557 N86-27195

**BOUNDARY LAYER SEPARATION**
A three-dimensional boundary-layer method for flow over delta wings with leading-edge separation
|SAE PAPER 851818| p 547 A86-38327
Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations: Dynamic stall p 561 N86-27231
Computational aspects of unsteady flows p 561 N86-27232

**BOUNDARY LAYER STABILITY**
Laminar boundary layer stability experiments on a cone at Mach 8. IV - On unit Reynolds number and environmental effects
|AIAA PAPER 86-1087| p 550 A86-38449

**BOUNDARY LAYER TRANSITION**
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft p 605 A86-38236
Effects of wind-tunnel noise on swept-cylinder transition at Mach 3.5
|AIAA PAPER 86-1085| p 550 A86-38447
Wall cooling effects on hypersonic boundary layer transition, M(1) = 7.5 - 15
|AIAA PAPER 86-1088| p 550 A86-38450
Analysis of transitional separation bubbles on infinite swept wings
|NASA-CR-3956| p 555 N86-26288

**BOUNDARY LAYERS**
Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects
|NASA-TM-87723| p 555 N86-26289
Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible?
|AGARD-R-723-ADD-1| p 556 N86-27187
Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics
|AGARD-CP-386| p 560 N86-27224

**BOUNDARY VALUE PROBLEMS**
A critical look at dynamic simulation of viscous flow p 560 N86-27230
Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations: Dynamic stall p 561 N86-27231
Unsteady vortex airfoil interaction p 562 N86-27240

**BOXES**
Equivalent plate analysis of aircraft wing box structures with general planform geometry
|AIAA PAPER 86-0940| p 583 A86-38837

**BRAKES (FOR ARRESTING MOTION)**
Operational flight experience and disassembly/inspection results of Space Shuttle orbiter actuators p 600 N86-27354

**BRAKING**
Integrated braking and ground directional control for tactical aircraft
|SAE PAPER 851941| p 581 A86-38374

**BRANCHING (MATHEMATICS)**
Nonlinear problems in flight dynamics involving aerodynamic bifurcations p 563 N86-27249
Bifurcation theory applied to aircraft motions p 563 N86-27250
Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266

**BUBBLES**
Experimental determination of the laminar separation bubble characteristics on an airfoil at low Reynolds numbers
|AIAA PAPER 86-1065| p 548 A86-38433
Analysis of transitional separation bubbles on infinite swept wings
|NASA-CR-3956| p 555 N86-26288

**BUCKLING**
Observations on compressive local buckling, postbuckling and crippling of graphite/epoxy airframe structure
|AIAA PAPER 86-0923| p 608 A86-38833
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|AIAA PAPER 86-0978| p 609 A86-38857
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|NASA-TM-86798| p 611 N86-26653
The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression --- semisubmersible platform
|NLR-MP-85019-U| p 611 N86-26661

**BUFFETING**
Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing p 561 N86-27239

**BULKHEADS**
A study of cracking in the pressure bulkhead of a military transport aircraft
|AIAA PAPER 86-0983| p 584 A86-38861

## C

**CADMIUM**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384

**CALIBRATING**
Calibration of droplet sizing and liquid water content instruments: Survey and analysis
|NASA-CR-175099| p 611 N86-26596
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth
|AD-A164719| p 611 N86-26603

**CANADA**
Developments in airworthiness control for Canadian airlines
|SAE PAPER 851784| p 620 A86-38308

**CANARD CONFIGURATIONS**
Three-dimensional, conservative, Euler computations using patched grid systems and explicit methods
|AIAA PAPER 86-1081| p 549 A86-38444
Interdependence of parameters important to the design of subsonic canard-configured aircraft
|SAE PAPER 850865| p 581 A86-38506

**CAPTIVE TESTS**
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

**CARBON**
Evaluation of JFTOT tube deposits by carbon burnoff --- Jet Fuel Thermal Oxidation Tester
|SAE PAPER 851994| p 602 A86-38539

**CARBON DIOXIDE LASERS**
Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326

**CARBON FIBER REINFORCED PLASTICS**
The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression --- semisubmersible platform
|NLR-MP-85019-U| p 611 N86-26661

**CARGO AIRCRAFT**
The C-17: An attempt at increased airlift versatility
|AD-A164822| p 540 N86-26280

**CASCADE FLOW**
Preliminary results of unsteady blade surface pressure measurements for the SR-3 propeller
|NASA-TM-87352| p 559 N86-27213

**CATAPULTS**
A new compressed air launching system p 596 A86-37337
The history and development of the repeatable release catapult holdback bar
|SAE PAPER 851942| p 581 A86-38375

**CATEGORIES**
Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts p 615 A86-37497

**CEMENTITE**
A cementitious tooling/molding material - Room temperature castable, high temperature capable
|SAE PAPER 850904| p 607 A86-38522

**CEMENTS**
Use of NDE to evaluate reflection cracking in airfield pavements
|AD-A164880| p 599 N86-27293

**CENTRIFUGAL COMPRESSORS**
Surge margin enhancement by a porous throat diffuser p 592 A86-39568

**CENTRIFUGAL PUMPS**
The Shock and Vibration Digest, volume 18, no. 1
|AD-A165726| p 612 N86-27468

**CERAMICS**
Fabrication of ceramic components for advanced gas turbine engines
|SAE PAPER 851786| p 606 A86-38310

**CERTIFICATION**
Putting a price on safety p 567 A86-37940

**CESSNA AIRCRAFT**
Study on using a digital ride quality augmentation system to trim an engine-out in a Cessna 402B
|NASA-CR-177272| p 595 N86-26342

**CHEMICAL PROPERTIES**
Properties of aircraft fuels and related materials
|AD-A164532| p 504 N86-27461

**CHEMISORPTION**
Oxygen chemisorption cryogenic refrigerator
|NASA-CASE-NPO-16734-1-CU| p 612 N86-27467

**CIRCULAR CYLINDERS**
Effects of wind-tunnel noise on swept-cylinder transition at Mach 3.5
|AIAA PAPER 86-1085| p 550 A86-38447

**CIRCULATION CONTROL AIRFOILS**
Aerodynamic characteristics of a circulation controlled symmetrical airfoil with dual jet p 541 A86-37196

**CIVIL AVIATION**
The Federal Aviation Administration future aviation weather system p 613 A86-37458
The hazards of ash clouds to civil air transport p 566 A86-37477
Putting a price on safety p 567 A86-37940
Human injury criteria relative to civil aircraft seat and restraint systems
|SAE PAPER 851847| p 567 A86-38343
A microcomputer pollution model for civilian airports and Air Force bases
|AD-A163232| p 616 N86-26714
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 17 of 1983 accidents
|PB85-916918| p 571 N86-27269

**CLADDING**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384
Effects of cladding and anodizing on flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys --- semisubmersible platform
|NLR-TR-85006-U| p 604 N86-26430

READEX FICHE best copy available

**CLEANLINESS**
Particulate contaminant relocation during shuttle ascent
|NASA-TM-87794| p 600 N86-27351
**CLEAR AIR TURBULENCE**
Development of CAT detection and forecasting techniques for the profs central weather processor
p 615 A86-37498
**CLIMATOLOGY**
A cold-season North American climatology of strong vertical wind shear p 614 A86-37466
**CLOUD GLACIATION**
Experimental measurements of heat transfer from an iced surface during artificial and natural cloud icing conditions
|AIAA PAPER 86-1352| p 598 A86-39948
**CLUTTER**
Evaluation of the ASR-9 weather reflectivity product --- airport surveillance radar p 614 A86-37485
**COATINGS**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384
Nonskid coating formulations
|AD-D012186| p 604 N86-27457
**COAXIAL FLOW**
Flight effects on noise from coaxial dual flow. I - Unheated jets p 619 A86-39058
**COCKPIT SIMULATORS**
Putting humans into virtual space -- with visually coupled cockpit simulator p 588 A86-37193
**COCKPITS**
Wind shear studies and cockpit integration
|SAE PAPER 851812| p 593 A86-38323
Avionics system architecture for Beechcraft Starship 1
|SAE PAPER 851851| p 589 A86-38346
Time runs out for the clockwork cockpit
p 583 A86-38701
Some quantitative methodology for cockpit design
p 586 N86-26320
**CODING**
Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations
|NASA-TM-87727| p 559 N86-27209
Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261
Structural tailoring of engine blades (STAEBL) user's manual
|NASA-CR-175113| p 592 N86-27284
A computer programme for DATCOM methods of estimation of lateral stability and control derivatives
|NAL-TM-AE-8601| p 596 N86-27289
**COLD WEATHER**
A cold-season North American climatology of strong vertical wind shear p 614 A86-37466
**COLD WORKING**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384
**COLLISION AVOIDANCE**
TCAS Experimental Unit (TEU) hardware description
|FAA/PM-85/2| p 574 N86-27272
**COLUMBIA (ORBITER)**
Operational flight experience and disassembly/inspection results of Space Shuttle orbiter actuators p 600 N86-27354
**COMBAT**
Techniques for sortie generation analysis
|SAE PAPER 851950| p 618 A86-38376
Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253
**COMBUSTIBLE FLOW**
Identification of longitudinal acoustic modes associated with pressure oscillations in ramjets p 591 A86-39079
The General Electric F404 - engine of the RAAF's new fighter
|AD-A164562| p 592 N86-26338
**COMBUSTION CHAMBERS**
Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine
p 591 A86-38998
Gas and erosion corrosion of the combustion chambers of aircraft engines p 592 A86-39725
**COMBUSTION PRODUCTS**
Gas and erosion corrosion of the combustion chambers of aircraft engines p 592 A86-39725
**COMBUSTION STABILITY**
Identification of longitudinal acoustic modes associated with pressure oscillations in ramjets p 591 A86-39079
**COMBUSTION TEMPERATURE**
Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine
p 591 A86-38998
**COMMERCIAL AIRCRAFT**
Time runs out for the clockwork cockpit
p 583 A86-38701
Composite material service experience on Boeing commercial airplanes
|AIAA PAPER 86-0947| p 603 A86-38841
**COMPARISON**
A comparison of voice and keyboard data entry for a helicopter navigation task
|AD-A163245| p 610 N86-26501
**COMPATIBILITY**
Some aspects of fluorocarbon elastomer compatibility with gas turbine lubricants
|SAE PAPER 851799| p 601 A86-38529
**COMPOSITE MATERIALS**
Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
|SAE SP-623| p 582 A86-38515
Operational experience of U.S. Air Force with structural composites
|AIAA PAPER 86-0946| p 583 A86-38840
Composite material service experience on Boeing commercial airplanes
|AIAA PAPER 86-0947| p 603 A86-38841
Crash energy absorbing composite sub-floor structure
|AIAA PAPER 86-0944| p 585 A86-38952
Recent developments in the dynamics of advanced rotor systems. I p 586 A86-39597
**COMPOSITE STRUCTURES**
The design of repairable advanced composite structures
|SAE PAPER 851830| p 606 A86-38335
Generation of an electroformed nickel mold for use in manufacturing composite parts
|SAE PAPER 850905| p 607 A86-38523
Composite material service experience on Boeing commercial airplanes
|AIAA PAPER 86-0947| p 603 A86-38841
Strength evaluation of helicopter composite bolted joints
|AIAA PAPER 86-0973| p 608 A86-38853
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 609 A86-38876
Aeroelastic tailoring of composite wings with external stores
|AIAA PAPER 86-1021| p 609 A86-38878
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384
Impact damage to composite structures
|AGARD-R-729| p 604 N86-27425
Optimized bolted joint
|NASA-CASE-LAR-13250-1| p 612 N86-27630
**COMPRESSED AIR**
A new compressed air launching system
p 596 A86-37337
**COMPRESSED GAS**
Multistage metal hydride compressor
|DE86-001965| p 604 N86-27465
**COMPRESSIBLE FLOW**
A comparison of experimental and numerical results for delta wings with vortex flaps
|AIAA PAPER 86-1840| p 546 A86-37848
Application of optical interferometry in compressible flows p 546 A86-38258
The indirect boundary integral formulation for elliptic, hyperbolic and non-linear fluid flows
p 553 A86-38971
La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984
|ESA-TT-907| p 559 N86-27217
**COMPRESSION LOADS**
Observations on compressive local buckling, postbuckling and crippling of graphite/epoxy airframe structure
|AIAA PAPER 86-0923| p 608 A86-38833
The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression --- semisubmersible platform
|NLR-MP-85019-U| p 611 N86-26661
**COMPRESSOR BLADES**
Aeroelastic tailoring of advanced composite compressor blades
|AIAA PAPER 86-1008| p 591 A86-38949
Structural tailoring of engine blades (STAEBL) theoretical manual
|NASA-CR-175112| p 592 N86-27283
Structural tailoring of engine blades (STAEBL) user's manual
|NASA-CR-175113| p 592 N86-27284
**COMPRESSOR ROTORS**
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
|NASA-CR-176840| p 610 N86-26546
**COMPRESSORS**
Multistage metal hydride compressor
|DE86-001965| p 604 N86-27465
Oxygen chemisorption cryogenic refrigerator
|NASA-CASE-NPO-16734-1-CU| p 612 N86-27467
**COMPUTATIONAL FLUID DYNAMICS**
Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers p 541 A86-37801
An analysis of elliptic grid generation techniques using an implicit Euler solver
|AIAA PAPER 86-1766| p 542 A86-37804
Euler solutions for the flow around a hovering helicopter rotor
|AIAA PAPER 86-1784| p 543 A86-37815
A spectral hodograph method for shockless transonic two-dimensional flow
|AIAA PAPER 86-1796| p 543 A86-37824
Counterflow sonic nosejet into a supersonic stream
|AIAA PAPER 86-1808| p 544 A86-37830
Supersonic airfoil optimization
|AIAA PAPER 86-1818| p 545 A86-37837
Wing and conical body of arbitrary cross-section combinations in supersonic flow
|AIAA PAPER 86-1826| p 545 A86-37841
The external drag of a simple axisymmetric body of revolution in subsonic and supersonic flow with variable mass flowthrough ratios
|AIAA PAPER 86-1828| p 545 A86-37842
Application of NCOREL to aircraft configurations --- CFD program
|AIAA PAPER 86-1830| p 577 A86-37843
An implicit flux-difference splitting scheme for three-dimensional, incompressible Navier-Stokes solutions to leading edge vortex flows
|AIAA PAPER 86-1839| p 546 A86-37847
A comparison of experimental and numerical results for delta wings with vortex flaps
|AIAA PAPER 86-1840| p 546 A86-37848
Euler calculations for flowfield of a helicopter rotor in hover
|AIAA PAPER 86-1782| p 577 A86-37849
Computational aerodynamic design - X-29, the Gulfstream series and a tactical fighter
|SAE PAPER 851789| p 547 A86-38313
Reduced Navier-Stokes (RNS relaxation procedure for internal flows with interaction)
|SAE PAPER 851790| p 547 A86-38314
Inviscid and viscous simulations of high angle of attack flows
|SAE PAPER 851820| p 548 A86-38328
Influence of numerical dissipation in computing supersonic vortex-dominated flows
|AIAA PAPER 86-1073| p 549 A86-38439
Block-structured solution of Euler equations for transonic flows
|AIAA PAPER 86-1080| p 549 A86-38443
Three-dimensional, conservative, Euler computation using patched grid systems and explicit methods
|AIAA PAPER 86-1081| p 549 A86-38444
Transonic potential flow calculations by two artificial density methods
|AIAA PAPER 86-1084| p 549 A86-38446
Unsteady aerodynamics of rapidly pitched airfoils
|AIAA PAPER 86-1105| p 551 A86-38465
Progress in the development of parabolized Navier-Stokes (PNS) methodology for analyzing propulsive jet mixing problems
|AIAA PAPER 86-1115| p 551 A86-38473
Lifting surface theory for the rest of us
|AIAA PAPER 86-1025| p 552 A86-38880
Unsteady transonic flow calculations for wing-fuselage configurations
|AIAA PAPER 86-0862| p 552 A86-38897
Nonisentropic unsteady three dimensional small disturbance potential theory
|AIAA PAPER 86-0863| p 552 A86-38898
A new approach to finite state modelling of unsteady aerodynamics
|AIAA PAPER 86-0865| p 552 A86-38900
A calculation method for unsteady aerodynamic forces in the Laplace domain and its application to root loci
|AIAA PAPER 86-0866| p 553 A86-38901
Application of the unsteady vortex-lattice method to the nonlinear two-degree-of-freedom aeroelastic equations
|AIAA PAPER 86-0867| p 553 A86-38902
A computational transonic flutter boundary tracking procedure
|AIAA PAPER 86-0902| p 553 A86-38913
The indirect boundary integral formulation for elliptic, hyperbolic and non-linear fluid flows
p 553 A86-38971
Computation of transonic flow about helicopter rotor blades p 554 A86-39053
Heat transfer and drag of a body in the far supersonic wake p 554 A86-39657

Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660

Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence --- graph theory |NLR-MP-84040-U| p 555 N86-26293

Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme |NAL-TR-889T| p 555 N86-27184

Vortex lift research: Early contributions and some current challenges p 556 N86-27191

Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations |NASA-TM-87727| p 559 N86-27209

La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984 |ESA-TT-907| p 559 N86-27217

A vortex point method for calculating inviscid incompressible flows around rotary wings p 612 N86-27219

Computational aspects of unsteady flows p 561 N86-27232

Review of SMP 1984 Symposium on Transonic Unsteady Aerodynamics and its Aeroelastic Applications p 561 N86-27236

Transonic aerodynamic and aeroelastic characteristics of a variable sweep wing p 561 N86-27237

Unsteady airload computations for airfoil oscillating in attached and separated compressible flow p 561 N86-27238

Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261

Modeling of the vortex-airfoil interaction p 565 N86-27262

Experimental study of the effect of turbulence on dynamic stalling p 565 N86-27264

Application of CFD techniques toward the validation of nonlinear aerodynamic models p 565 N86-27265

Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266

**COMPUTATIONAL GRIDS**

Numerical simulation of precipitation induced downbursts p 615 A86-37496

An analysis of elliptic grid generation techniques using an implicit Euler solver |AIAA PAPER 86-1766| p 542 A86-37804

Three-dimensional, conservative, Euler computations using patched grid systems and explicit methods |AIAA PAPER 86-1081| p 549 A86-38444

Transonic flow solutions on a blunt, finned body of revolution using the Euler equations |AIAA PAPER 86-1082| p 549 A86-38445

Transonic potential flow calculations by two artificial density methods |AIAA PAPER 86-1084| p 549 A86-38446

**COMPUTER AIDED DESIGN**

ASTROS - An advanced software environment for automated design |AIAA PAPER 86-0856| p 618 A86-38807

Optimum design of large structures with multiple constraints |AIAA PAPER 86-0952| p 600 A86-38845

Frequency domain synthesis of a robust flutter suppression control law p 594 A86-39042

**COMPUTER AIDED MANUFACTURING**

Flexible manufacturing system for the fabrication of precision components with real time simulation |SAE PAPER 851804| p 606 A86-38320

Development, construction, and manufacturing of wind tunnel models for aerodynamic investigations |BMFT-FB-W-85-012| p 600 N86-27296

**COMPUTER AIDED MAPPING**

Wide area real-time thunderstorm mapping using LPATS - The lightning position and tracking system p 614 A86-37487

**COMPUTER GRAPHICS**

CGI delay compensation --- Computer Generated Image p 617 A86-37194

A real-time simulation of a non-linear RPV incorporating head-up type colour graphics p 593 A86-37335

An optimization model for the US Air-Traffic System |NASA-CR-177277| p 574 N86-27271

**COMPUTER PROGRAMS**

Microcomputers and aviation --- Book p 567 A86-37625

Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations |NASA-TM-87727| p 559 N86-27209

Structural tailoring of engine blades (STAEBL) user's manual |NASA-CR-175113| p 592 N86-27284

KRASH85 user's guide: Input/output format |DOT/FAA/CT-85/10-REV| p 618 N86-27926

**COMPUTER SYSTEMS PERFORMANCE**

Techniques for optimizing computer performance in real-time flight simulation p 617 A86-37177

**COMPUTER SYSTEMS PROGRAMS**

ASTROS - An advanced software environment for automated design |AIAA PAPER 86-0856| p 618 A86-38807

**COMPUTER TECHNIQUES**

A minimum route time (MRT) program for microcomputers p 572 A86-39561

An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures |AD-A165588| p 540 N86-26282

New dynamic testing techniques and related results at FFA p 562 N86-27244

Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements |AD-A165055| p 599 N86-27294

The Shock and Vibration Digest, volume 17, no. 8 |AD-A165115| p 612 N86-27471

**COMPUTERIZED SIMULATION**

Techniques for optimizing computer performance in real-time flight simulation p 617 A86-37177

Simulation support software in a real-time environment at the U.S. Air Force Flight Test Center p 617 A86-37180

Evaluation of the ASR-9 weather reflectivity product --- airport surveillance radar p 614 A86-37485

Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769

Flexible manufacturing system for the fabrication of precision components with real time simulation |SAE PAPER 851804| p 606 A86-38320

Structural analysis of the controlled impact demonstration of a jet transport airplane |AIAA PAPER 86-0939| p 583 A86-38836

Generic aircraft ground operation simulation |AIAA PAPER 86-0989| p 584 A86-38865

A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application p 591 A86-38994

An Euler aerodynamic method for leading-edge vortex flow simulation p 558 N86-27203

Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements |AD-A165055| p 599 N86-27294

**CONCRETES**

Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies |AD-A163379| p 610 N86-26480

Use of NDE to evaluate reflection cracking in airfield pavements |AD-A164880| p 599 N86-27293

**CONES**

Laminar boundary layer stability experiments on a cone at Mach 8. IV - On unit Reynolds number and environmental effects |AIAA PAPER 86-1087| p 550 A86-38449

**CONFERENCES**

Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 p 596 A86-37176

Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings and Supplementary Papers p 575 A86-37326

International Conference on the Aviation Weather System, 2nd, Universite du Quebec, Montreal, Canada, June 19-21, 1985, Preprints p 613 A86-37451

Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers p 541 A86-37801

General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 |SAE SP-621| p 581 A86-38501

Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 |SAE SP-622| p 582 A86-38509

Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985 |SAE SP-623| p 582 A86-38515

Aviation gas turbine lubricants - Military and civil aspects; Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 |SAE SP-633| p 607 A86-38526

Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations |AGARD-CP-387| p 573 N86-26316

**CONFIGURATION INTERACTION**

Unsteady vortex airfoil interaction p 562 N86-27240

Modeling of the vortex-airfoil interaction p 565 N86-27262

**CONICAL BODIES**

Effects of cone surface waviness and freestream noise on transition in supersonic flow |AIAA PAPER 86-1086| p 550 A86-38448

**CONICAL FLOW**

Wing and conical body of arbitrary cross-section combinations in supersonic flow |AIAA PAPER 86-1826| p 545 A86-37841

Navier-Stokes computations of lee-side flows over delta wings |AIAA PAPER 86-1049| p 548 A86-38420

Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660

**CONSTRAINTS**

An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft |NAL-TR-893| p 587 N86-27277

Structural tailoring of engine blades (STAEBL) theoretical manual |NASA-CR-175112| p 592 N86-27283

**CONTAMINANTS**

Aircraft engine emissions estimator |AD-A164552| p 616 N86-26715

Particulate contaminant relocation during shuttle ascent |NASA-TM-87794| p 600 N86-27351

**CONTRAROTATING PROPELLERS**

Unsteady forces on counter-rotating propeller blades |AIAA PAPER 86-1804| p 590 A86-37827

**CONTROL CONFIGURED VEHICLES**

Dynamic interactions between active control systems and a flexible aircraft structure |AIAA PAPER 86-0960| p 594 A86-38932

Frequency domain synthesis of a robust flutter suppression control law p 594 A86-39042

**CONTROL EQUIPMENT**

An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft |NAL-TR-893| p 587 N86-27277

**CONTROL SIMULATION**

A real-time simulation of a non-linear RPV incorporating head-up type colour graphics p 593 A86-37335

**CONTROL STABILITY**

Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395

Integrated aeroservoelastic tailoring of lifting surfaces |AIAA PAPER 86-1005| p 594 A86-38946

**CONTROL SURFACES**

Design and certification of a composite control surface |SAE PAPER 850888| p 582 A86-38516

Use of the flight simulator in performing AFTI/F-16 airplane aeroservoelastic analysis |AIAA PAPER 86-0957| p 585 A86-38931

Flutter of wings with leading edge control surfaces |AIAA PAPER 86-0897| p 585 A86-38950

**CONTROL SYSTEMS DESIGN**

Multi-input multi-output automatic design synthesis for performance and robustness p 618 A86-39034

Design of a flutter mode controller using positive real feedback p 594 A86-39041

On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254

**CONTROL THEORY**

Influence of FBW - Control laws on structural design of modern transport aircraft --- fly by wire |AIAA PAPER 86-0953| p 584 A86-38846

**CONVECTIVE HEAT TRANSFER**

Heat transfer and drag of a body in the far supersonic wake p 554 A86-39657

**CONVERGENCE**

Recent extensions to the free-vortex-sheet theory for expanded convergence capability p 556 N86-27194

**CORE FLOW**

The General Electric F404 - engine of the RAAF's new fighter |AD-A164562| p 592 N86-26338

**CORRELATION**

Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies |AD-A163379| p 610 N86-26480

**CORROSION PREVENTION**

Environmental and adhesive durability of aluminium-polymer systems protected with organic corrosion inhibitors p 601 A86-37708

An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures |AD-A165588| p 540 N86-26282

Properties of aircraft fuels and related materials |AD-A164532| p 604 N86-27461

**COST ANALYSIS**

Structural tailoring of engine blades (STAEBL) user's manual |NASA-CR-175113| p 592 N86-27284

**COST EFFECTIVENESS**
Cost-effective remote-site testing --- of de Havilland aircraft p 539 A86-39570
Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force
|AD-A164864| p 599 N86-26346
**COST REDUCTION**
How US companies are attacking production costs --- of aircraft p 605 A86-37323
Cost-effective remote-site testing --- of de Havilland aircraft p 539 A86-39570
**COSTS**
An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures
|AD-A165588| p 540 N86-26282
Integrated risk/cost planning models for the US Air Traffic system
|NASA-CR-177274| p 573 N86-26312
**COUNTERFLOW**
Counterflow sonic nosejet into a supersonic stream
|AIAA PAPER 86-1808| p 544 A86-37830
**COUPLING**
Linear dynamic coupling in geared rotor systems
|ASME PAPER 85-DET-11| p 608 A86-38617
**CRACK ARREST**
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform
|NLR-TR-84051-U| p 611 N86-26662
**CRACK CLOSURE**
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform
|NLR-TR-84051-U| p 611 N86-26662
**CRACK PROPAGATION**
Effect of crack growth rate variations on life predictions
|AIAA PAPER 86-0981| p 603 A86-38859
**CRACKING (FRACTURING)**
Use of NDE to evaluate reflection cracking in airfield pavements
|AD-A164880| p 599 N86-27293
**CRASH INJURIES**
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298
**CRASH LANDING**
The crash of C-GTLA - The cumulative effects of small defects and a hint of a previously unrecognized major meteorological hazard p 567 A86-37489
NASA experiments onboard the controlled impact demonstration
|SAE PAPER 851885| p 568 A86-38352
Antimisting fuel technology for transport category aircraft
|SAE PAPER 851886| p 568 A86-38353
Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
|SAE SP-622| p 582 A86-38509
A procedure to evaluate aircraft crash floor pulses
|SAE PAPER 850854| p 582 A86-38513
Preliminary design research for the Caravan 1 crew seat
|SAE PAPER 850856| p 582 A86-38514
Structural analysis of the controlled impact demonstration of a jet transport airplane
|AIAA PAPER 86-0939| p 583 A86-38836
**CRASHES**
Crash energy absorbing composite sub-floor structure
|AIAA PAPER 86-0944| p 585 A86-38952
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 5 of 1984 accidents
|PB86-916901| p 570 N86-26305
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 6 of 1984 accidents
|PB86-916902| p 570 N86-26306
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 7 of 1984 accidents
|PB86-916903| p 570 N86-26307
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 8 of 1984 accidents
|PB86-916904| p 570 N86-26308
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 9 of 1984 Accidents
|PB86-916905| p 570 N86-26309
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 11 of 1984 accidents
|PB86-916907| p 571 N86-26310
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 13 of 1984 accidents
|PB86-916909| p 571 N86-26311
National Transportation Safety Board safety recommendation
|NTSB-4102C/300A| p 571 N86-27267
KRASH85 user's guide: Input/output format
|DOT/FAA/CT-85/10-REV| p 618 N86-27926
**CRASHWORTHINESS**
Human injury criteria relative to civil aircraft seat and restraint systems
|SAE PAPER 851847| p 567 A86-38343
Controlled impact demonstration review --- for aircraft crashworthiness evaluation
|SAE PAPER 851884| p 567 A86-38351
NASA experiments onboard the controlled impact demonstration
|SAE PAPER 851885| p 568 A86-38352
FAA structural crash dynamics program update - Transport category aircraft
|SAE PAPER 851887| p 568 A86-38354
Transport aircraft crashworthiness requirements - An industry view
|SAE PAPER 851888| p 580 A86-38355
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298
Safety report General Aviation Crashworthiness Project. Phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
|PB85-917016| p 569 N86-26302
**CREEP RUPTURE STRENGTH**
Effects of section thickness and orientation on creep-rupture properties of two advanced single crystal alloys
|SAE PAPER 851785| p 601 A86-38309
**CREW WORKSTATIONS**
Some quantitative methodology for cockpit design
p 586 N86-26320
**CROSS COUPLING**
Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339
**CRUISING FLIGHT**
An application of the Carson cruise optimum airspeed - A compromise between speed and efficiency
|SAE PAPER 850867| p 582 A86-38508
**CRUSHING**
Crash energy absorbing composite sub-floor structure
|AIAA PAPER 86-0944| p 585 A86-38952
**CRYOGENIC COOLING**
Oxygen chemisorption cryogenic refrigerator
|NASA-CASE-NPO-16734-1-CU| p 612 N86-27467
**CRYOGENIC WIND TUNNELS**
National transonic facility Mach numer system
p 597 A86-38076
Instrumentation and testing techniques in the T2 transonic cryogenic wind tunnel at the ONERA/CERT
p 597 A86-38228
Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects
|NASA-TM-87723| p 555 N86-26289
**CUMULATIVE DAMAGE**
The crash of C-GTLA - The cumulative effects of small defects and a hint of a previously unrecognized major meteorological hazard p 567 A86-37489
A study of cracking in the pressure bulkhead of a military transport aircraft
|AIAA PAPER 86-0983| p 584 A86-38861
**CURING**
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 609 A86-38876
**CURVED PANELS**
The use of curved higher order panels for vortex sheet modeling
|AIAA PAPER 86-1812| p 544 A86-37833

## D

**DAMAGE**
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 5 of 1984 accidents
|PB86-916901| p 570 N86-26305
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 6 of 1984 accidents
|PB86-916902| p 570 N86-26306
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 7 of 1984 accidents
|PB86-916903| p 570 N86-26307
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 8 of 1984 accidents
|PB86-916904| p 570 N86-26308
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 9 of 1984 Accidents
|PB86-916905| p 570 N86-26309
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 11 of 1984 accidents
|PB86-916907| p 571 N86-26310
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 13 of 1984 accidents
|PB86-916909| p 571 N86-26311
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
|AD-A165055| p 599 N86-27294
**DAMAGE ASSESSMENT**
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 3 of 1984 accidents
|PB85-916922| p 570 N86-26303
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 4 of 1984 accidents
|PB85-916923| p 570 N86-26304
**DAMPING**
Standard dynamics model experiments with the DFVLR/AVA transonic derivative balance
p 562 N86-27245
**DATA ACQUISITION**
New dynamic testing techniques and related results at FFA p 562 N86-27244
Dynamic nonlinear airloads: Representation and measurement p 563 N86-27251
**DATA PROCESSING**
Radar data processing. Volume 2 - Advanced topics and applications --- Book p 605 A86-38224
**DATA TRANSMISSION**
Microwave Landing System (MLS) station interface control report
|DOT/FAA/PM-86/17| p 540 N86-27178
**DE HAVILLAND AIRCRAFT**
Cost-effective remote-site testing --- of de Havilland aircraft p 539 A86-39570
**DECISION MAKING**
Pilot's Associate - What should it do? --- pilot and airborne computer task allocations
|SAE PAPER 851890| p 539 A86-38356
An efficient decision-making-free filter for processes with abrupt changes --- aircraft tracking
|NLR-MP-84080-U| p 618 N86-27018
**DECOUPLING**
Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339
**DEFLECTION**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
|AD-A163379| p 610 N86-26480
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
|AD-A165055| p 599 N86-27294
**DEGREES OF FREEDOM**
Experimental aeroelastic behavior of forward swept graphite/epoxy wings with rigid body freedoms
|AIAA PAPER 86-0971| p 584 A86-38851
**DEICERS**
Analyses and tests for design of an electro-impulse de-icing system
|NASA-CR-174919| p 571 N86-27268
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
|NASA-CR-177260| p 599 N86-27291
**DEICING**
Calibration of droplet sizing and liquid water content instruments: Survey and analysis
|NASA-CR-175099| p 611 N86-26596
Analyses and tests for design of an electro-impulse de-icing system
|NASA-CR-174919| p 571 N86-27268
**DELTA WINGS**
An investigation of improving high angle of attack performance and flap effectiveness of a configuration with delta wing by spanwise blowing
|AIAA PAPER 86-1777| p 542 A86-37811
Analytical observations on the aerodynamics of a delta wing with leading edge flaps
|AIAA PAPER 86-1790| p 543 A86-37820
Calculation of asymmetric vortex separation on slender delta wings with a vortex-sheet model
|AIAA PAPER 86-1836| p 546 A86-37846
A comparison of experimental and numerical results for delta wings with vortex flaps
|AIAA PAPER 86-1840| p 546 A86-37848
A three-dimensional boundary-layer method for flow over delta wings with leading-edge separation
|SAE PAPER 851818| p 547 A86-38327
Navier-Stokes computations of lee-side flows over delta wings
|AIAA PAPER 86-1049| p 548 A86-38420
Influence of numerical dissipation in computing supersonic vortex-dominated flows
|AIAA PAPER 86-1073| p 549 A86-38439
Unsteady vortical flow around three-dimensional lifting surfaces p 553 A86-39052

Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence --- graph theory
| NLR-MP-84040-U | p 555 N86-26293
Extensions of the concept of suction analogy to prediction of vortex lift effect p 556 N86-27193
A direct and inverse boundary layer method for subsonic flow over delta wings p 557 N86-27195
An experimental investigation of vortex breakdown on a delta wing p 557 N86-27196
Basic studies on delta wing flow modifications by means of apex fences p 557 N86-27199
Viscous vortical flow calculations over delta wings p 558 N86-27202
Computation of leading-edge vortex flows p 558 N86-27205
Steady supersonic Navier-Stokes solutions of a 75 deg delta wing p 558 N86-27206
Water tunnel results of leading-edge vortex flap tests on a delta wing vehicle p 558 N86-27208

**DENSITY (MASS/VOLUME)**
Properties of aircraft fuels and related materials
| AD-A164532 | p 604 N86-27461

**DENSITY DISTRIBUTION**
Profiles of temperature and density based on extremes at 5, 10, 20, 30 and 40 km p 616 N86-27727

**DEPOSITION**
Deposition in gas turbine oil systems. I - Analysis and classification
| SAE PAPER 851869 | p 602 A86-38536

**DEPOSITS**
Evaluation of JFTOT tube deposits by carbon burnoff --- Jet Fuel Thermal Oxidation Tester
| SAE PAPER 851994 | p 602 A86-38539

**DESIGN ANALYSIS**
A method for the design of shock-free slender bodies of revolution p 554 A86-39054
Processes for the manufacture of aviation instrument components (2nd revised and enlarged edition) --- Russian book p 610 A86-39979
Some quantitative methodology for cockpit design p 586 N86-26320
TCAS Experimental Unit (TEU) hardware description
| FAA/PM-85/2 | p 574 N86-27272
Large-Scale Advanced Prop-Fan (LAP) pitch change actuator and control design report
| NASA-CR-174788 | p 592 N86-27282
Structural tailoring of engine blades (STAEBL) theoretical manual
| NASA-CR-175112 | p 592 N86-27283
Structural tailoring of engine blades (STAEBL) user's manual
| NASA-CR-175113 | p 592 N86-27284
Static aeroelasticity in combat aircraft
| AGARD-R-725 | p 613 N86-27678

**DESORPTION**
Multistage metal hydride compressor
| DE86-001965 | p 604 N86-27465

**DETECTION**
Minimum operational performance standards for airborne thunderstorm detection equipment
| RTCA/DO-191 | p 617 N86-27851

**DIESEL ENGINES**
Preliminary evaluation of a compound cycle engine for shipboard gensets
| NASA-CR-179451 | p 611 N86-26629

**DIFFERENCE EQUATIONS**
An efficient decision-making-free filter for processes with abrupt changes --- aircraft tracking
| NLR-MP-84080-U | p 618 N86-27018

**DIFFERENTIAL EQUATIONS**
Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266

**DIFFUSERS**
Surge margin enhancement by a porous throat diffuser p 592 A86-39568

**DIGITAL SYSTEMS**
Application of analytical redundancy --- for flight safety
| SAE PAPER 851825 | p 593 A86-38331
The integrated digital avionics system for the F-20 Tigershark
| SAE PAPER 851850 | p 589 A86-38345
A solid-state map display for rapid response operation p 589 N86-26323
Applications of digital terrain data in flight operations p 573 N86-26324
Study on using a digital ride quality augmentation system to trim an engine-out in a Cessna 402B
| NASA-CR-177272 | p 595 N86-26342

**DIGITAL TECHNIQUES**
Design, development and operation of a high simultaneous capacity digital telemetry system p 613 N86-27632

**DIRECTIONAL CONTROL**
Integrated braking and ground directional control for tactical aircraft
| SAE PAPER 851941 | p 581 A86-38374

**DISPLAY DEVICES**
Putting humans into virtual space --- with visually coupled cockpit simulator p 588 A86-37193
Time runs out for the clockwork cockpit p 583 A86-38701
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations
| AGARD-CP-387 | p 573 N86-26316
Synthetic real-time relief display all-weather airborne missions p 589 N86-26321
A solid-state map display for rapid response operation p 589 N86-26323
Applications of digital terrain data in flight operations p 573 N86-26324
Aircraft liftmeter
| NASA-CASE-LAR-12518-1 | p 590 N86-27280

**DIVERGENCE**
Divergence study of a high-aspect ratio, forward-swept wing
| NASA-TM-87682 | p 588 N86-27279

**DOPPLER NAVIGATION**
A comparison of voice and keyboard data entry for a helicopter navigation task
| AD-A163245 | p 610 N86-26501

**DOPPLER RADAR**
The FAA/M.I.T. Lincoln Laboratory Doppler Weather Radar program p 614 A86-37461

**DOWNWASH**
Effects of aerodynamic lags on aircraft responses p 564 N86-27257

**DRAG REDUCTION**
Experimental investigation of rotorcraft hub and shaft fairing drag reduction
| AIAA PAPER 86-1783 | p 577 A86-37814
Drag-reduction characteristics of aft-swept wing tips
| AIAA PAPER 86-1824 | p 545 A86-37840
Towards an advanced vortex flap system: The cavity flap p 557 N86-27200

**DROOPED AIRFOILS**
Leading-edge design for improved spin resistance of wings incorporating conventional and advanced airfoils
| SAE PAPER 851816 | p 578 A86-38325

**DROPS (LIQUIDS)**
Calibration of droplet sizing and liquid water content instruments: Survey and analysis
| NASA-CR-175099 | p 611 N86-26596

**DUCTED FLOW**
Experiments on supersonic turbulent flow development in a square duct
| AIAA PAPER 86-1038 | p 548 A86-38412

**DURABILITY**
Durability prediction of parallel fuel tank skins with fluid-structure interaction dynamics
| AIAA PAPER 86-0935 | p 591 A86-38927

**DYNAMIC LOADS**
The dynamic instability of plate structures p 605 A86-37348
The Shock and Vibration Digest, volume 18, no. 1
| AD-A165726 | p 612 N86-27468
The Shock and Vibration Digest, volume 17, no. 8
| AD-A165115 | p 612 N86-27471

**DYNAMIC MODELS**
Review of dynamic inflow modeling for rotorcraft flight dynamics
| AIAA PAPER 86-0845 | p 584 A86-38893
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
| AD-A165235 | p 599 N86-27295

**DYNAMIC MODULUS OF ELASTICITY**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
| AD-A163379 | p 610 N86-26480

**DYNAMIC PRESSURE**
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft p 605 A86-38236

**DYNAMIC PROGRAMMING**
A new technique for terrain following/terrain avoidance guidance command generation p 574 N86-26325

**DYNAMIC RESPONSE**
Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts p 615 A86-37497
On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254
Effects of aerodynamic lags on aircraft responses p 564 N86-27257
Gust alleviation on a transport airplane p 565 N86-27259

**DYNAMIC STABILITY**
Bifurcation theory applied to aircraft motions p 563 N86-27250

**DYNAMIC STRUCTURAL ANALYSIS**
Gust response of hingeless rotors p 576 A86-37772
Stochastic flutter of nonlinear aeroelastic structures with parameter random fluctuations
| AIAA PAPER 86-0962 | p 609 A86-38934

**DYNAMIC TESTS**
Instrumentation and other issues in non-linear dynamic testing in wind tunnels p 597 A86-38248
Aircraft Landing Dynamics Facility - A unique facility with new capabilities
| SAE PAPER 851938 | p 598 A86-38371
Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
| SAE SP-622 | p 582 A86-38509
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
| AD-A164828 | p 569 N86-26298
Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263
Divergence study of a high-aspect ratio, forward-swept wing
| NASA-TM-87682 | p 588 N86-27279

**DYNAMICAL SYSTEMS**
Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395
Linear dynamic coupling in geared rotor systems
| ASME PAPER 85-DET-11 | p 608 A86-38617

**DYNAMOMETERS**
Laboratory simulation of landing gear pitch-plane dynamics
| SAE PAPER 851937 | p 598 A86-38370

**E**

**ECONOMIC IMPACT**
The safety and economic impact of improved aviation weather services p 613 A86-37454

**EFFECTIVE PERCEIVED NOISE LEVELS**
Advisory Circular: Estimated airplane noise levels in A-weighted decibels
| AC-36-3D | p 620 N86-27969

**EIGENVALUES**
Decoupling control synthesis for an oblique-wing aircraft
| NASA-TM-86801 | p 595 N86-26339

**EJECTION SEATS**
Human injury criteria relative to civil aircraft seat and restraint systems
| SAE PAPER 851847 | p 567 A86-38343

**ELASTIC BUCKLING**
Buckling and final failure of graphite/PEEK stiffener sections
| AIAA PAPER 86-0921 | p 608 A86-38831

**ELASTIC PROPERTIES**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
| AD-A163379 | p 610 N86-26480
Gust alleviation on a transport airplane p 565 N86-27259

**ELASTOMERS**
Some aspects of fluorocarbon elastomer compatibility with gas turbine lubricants
| SAE PAPER 851[illegible]09 | p 601 A86-38529
The influence of esters on elastomer seals
| SAE PAPER 851868 | p 602 A86-38535
The Shock and Vibration Digest, volume 18, no. 1
| AD-A165726 | p 612 N86-27468

**ELECTRIC DISCHARGES**
Minimum operational performance standards for airborne thunderstorm detection equipment
| RTCA/DO-191 | p 617 N86-27851

**ELECTRIC PULSES**
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
| NASA-CR-177260 | p 599 N86-27291

**ELECTRICAL MEASUREMENT**
Lightning measurements of an aircraft flying at low altitude p 567 A86-37490

**ELECTRO-OPTICS**
FLIR, NVG and HMS/D systems for helicopter operation: Review p 619 N86-26804

**ELECTROCHEMICAL CORROSION**
Electrochemical evaluation of corrosivity in turbine engine oils
| SAE PAPER 851867 | p 602 A86-38534

**ELECTRODYNAMICS**
Analyses and tests for design of an electro-impulse de-icing system
| NASA-CR-174919 | p 571 N86-27268

**ELECTROFORMING**
Generation of an electroformed nickel mold for use in manufacturing composite parts
|SAE PAPER 850905| p 607 A86-38523

**ELECTROMAGNETIC INTERFERENCE**
A technique to evaluate the accessibility of airborne receivers to interfering signals p 572 A86-37555

**ELECTROMAGNETISM**
Analyses and tests for design of an electro-impulse de-icing system
|NASA-CR-174919| p 571 N86-27268

**ELECTROMECHANICAL DEVICES**
Designing compact electromechanical actuators for flight control p 593 A86-37332

**ELECTRONIC COUNTERMEASURES**
What USAF aircraft should be the Wild Weasel of the 1990's?: An assesament of the F-4G, the F-15WW, and F-16WW
|AD-A164727| p 539 N86-26279

**EMERGENCIES**
Design, safety, and maintainability aspects for hydrazine use in emergency secondary power systems
|SAE PAPER 851972| p 568 A86-38382

**EMISSION**
A microcomputer pollution model for civilian airports and Air Force bases
|AD-A163232| p 616 N86-26714
Aircraft engine emissions estimator
|AD-A164552| p 616 N86-26715

**ENERGY ABSORPTION**
Crash energy absorbing composite sub-floor structure
|AIAA PAPER 86-0944| p 585 A86-38952
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298

**ENGINE DESIGN**
Reliability and maintainability - A look at the Rolls-Royce RB.211
|SAE PAPER 851829| p 590 A86-38334
Harrier III-AV8B with a modern engine
|SAE PAPER 851881| p 579 A86-38349
The significance of advanced technology engines on V/STOL systems
|SAE PAPER 851882| p 579 A86-38350
Design, safety, and maintainability aspects for hydrazine use in emergency secondary power systems
|SAE PAPER 851972| p 568 A86-38382
Off-design operation of turbomachines --- French book
p 591 A86-38956
Three-dimensional inviscid flow in mixers. I - Mixer analysis using a Cartesian grid p 554 A86-39090

**ENGINE INLETS**
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
|AD-A164629| p 555 N86-26291

**ENGINE MONITORING INSTRUMENTS**
Surface layer activation technique for monitoring and in situ wear mearurement of turbine components
p 591 A86-39086

**ENGINE NOISE**
Wave envelope and finite element approximations for turbofan noise radiation in flight p 619 A86-39057
Flight effects on noise from coaxial dual flow. I - Unheated jets p 619 A86-39058

**ENGINE PARTS**
Fabrication of ceramic components for advanced gas turbine engines
|SAE PAPER 851786| p 606 A86-38310
Surface layer activation technique for monitoring and in situ wear mearurement of turbine components
p 591 A86-39086

**ENGINE TESTS**
A new approach to automated gas turbine engine testing p 597 A86-38070
Preliminary evaluation of a compound cycle engine for shipboard gensets
|NASA-CR-179451| p 611 N86-26629

**ENVIRONMENT MODELS**
A microcomputer pollution model for civilian airports and Air Force bases
|AD-A163232| p 616 N86-26714
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

**ENVIRONMENTAL SURVEYS**
Analysis of helicopter noise data using international helicopter noise certification procedures
|PB86-186533| p 620 N86-27972

**EQUATIONS OF MOTION**
Extraction of aerodynamic parameters for aircraft at extreme flight conditions p 563 N86-27248
Effects of aerodynamic lags on aircraft responses
p 564 N86-27257

**EQUIPMENT SPECIFICATIONS**
Aircraft ground support equipment standardization - The pros and cons of 'functional' vs 'technical' standardization
|SAE PAPER 851794| p 620 A86-38317
New rotary rig at RAE and experiments on HIRM
p 562 N86-27243
Minimum operational performance standards for airborne thunderstorm detection equipment
|RTCA/DO-191| p 617 N86-27851

**ERROR CORRECTING DEVICES**
Improvement of strapdown system performance by means of numerical methods
|BMFT-FB-W-85-011| p 575 N86-27275

**ERROR DETECTION CODES**
Application of analytical redundancy --- for flight safety
|SAE PAPER 851825| p 593 A86-38331

**ESTERS**
The influence of esters on elastomer seals
|SAE PAPER 851668| p 602 A86-38535

**ESTIMATING**
A computer programme for DATCOM methods of estimation of lateral stability and control derivatives
|NAL-TM-AE-8601| p 596 N86-27289

**EULER EQUATIONS OF MOTION**
Applied Aerodynamics Conference, 4th, San Diego, CA, June 9-11, 1986, Technical Papers p 541 A86-37801
Unsteady transonic flows past airfoils using the Euler equations
|AIAA PAPER 86-1764| p 541 A86-37802
Euler calculation for flow over a wing in ground effect
|AIAA PAPER 86-1765| p 542 A86-37803
An analysis of elliptic grid generation techniques using an implicit Euler solver
|AIAA PAPER 86-1766| p 542 A86-37804
Euler solutions for aircraft configurations employing upper surface blowing (USB)
|AIAA PAPER 86-1767| p 542 A86-37805
Euler solutions for the flow around a hovering helicopter rotor
|AIAA PAPER 86-1784| p 543 A86-37815
Euler calculations for flowfield of a helicopter rotor in hover
|AIAA PAPER 86-1782| p 577 A86-37849
Block-structured solution of Euler equations for transonic flows
|AIAA PAPER 86-1080| p 549 A86-38443
Three-dimensional, conservative, Euler computations using patched grid systems and explicit methods
|AIAA PAPER 86-1081| p 549 A86-38444
Transonic flow solutions on a blunt, finned body of revolution using the Euler equations
|AIAA PAPER 86-1082| p 549 A86-38445
An Euler aerodynamic method for leading-edge vortex flow simulation p 558 N86-27203
Computation of leading-edge vortex flows
p 558 N86-27205

**EUROPEAN AIRBUS**
Development, construction, and manufacturing of wind tunnel models for aerodynamic investigations
|BMFT-FB-W-85-012| p 60 N86-27296

**EVALUATION**
Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations
|NASA-TM-87727| p 559 N86-27209

**EXHAUST GASES**
Aircraft engine emissions estimator
|AD-A164552| p 616 N86-26715

**EXPANSION**
The C-17: An attempt at increased airlift versatility
|AD-A164822| p 540 N86-26280

**EXPERT SYSTEMS**
A demonstration expert system for implementing emergency procedures in a high-performance fighter aircraft
|MAE-1749| p 569 N86-26295

**EXTERNAL STORES**
Aeroelastic tailoring of composite wings with external stores
|AIAA PAPER 86-1021| p 609 A86-38878
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

## F

**F-106 AIRCRAFT**
NASA storm hazards research in lightning strikes to aircraft p 566 A86-37479

**F-15 AIRCRAFT**
Summary of results of NASA F-15 flight research program
|NASA-TM-86811| p 539 N86-26277
Recent developments in rotary-balance testing of fighter aircraft configurations at NASA Ames Research Center
p 562 N86-27242

**F-16 AIRCRAFT**
The F-16 aircraft and hydrazine - An industrial hygiene perspective
|SAE PAPER 851971| p 568 A86-38381
Use of the flight simulator in performing AFTI/F-16 airplane aeroservoelastic analysis
|AIAA PAPER 86-0957| p 585 A86-38931

**F-18 AIRCRAFT**
Flutter of wings with leading edge control surfaces
|AIAA PAPER 86-0897| p 585 A86-38950

**F-20 AIRCRAFT**
The integrated digital avionics system for the F-20 Tigershark
|SAE PAPER 851850| p 589 A86-38345

**F-4 AIRCRAFT**
Integrated braking and ground directional control for tactical aircraft
|SAE PAPER 851941| p 581 A86-38374

**FABRICATION**
Fabrication of ceramic components for advanced gas turbine engines
|SAE PAPER 851786| p 606 A86-38310
Processes for the manufacture of aviation instrument components (2nd revised and enlarged edition) --- Russian book p 610 A86-39979

**FACTORIZATION**
Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme
|NAL-TR-889T| p 555 N86-27184

**FAILURE ANALYSIS**
Buckling and final failure of graphite/PEEK stiffener sections
|AIAA PAPER 86-0921| p 608 A86-38831

**FAIRINGS**
Experimental investigation of rotorcraft hub and shaft fairing drag reduction
|AIAA PAPER 86-1783| p 577 A86-37814

**FASTENERS**
The design of repairable advanced composite structures
|SAE PAPER 851830| p 606 A86-38335

**FATIGUE LIFE**
Effect of crack growth rate variations on life predictions
|AIAA PAPER 86-0981| p 603 A86-38859
Durability prediction of parallel fuel tank skins with fluid-structure interaction dynamics
|AIAA PAPER 86-0935| p 591 A86-38927

**FATIGUE TESTS**
Engineering property comparisons for 2324-T39 and 2024-T351 aluminum alloy plate --- semisubmersible platform
|NLR-TR-84021-U| p 603 N86-26429
Effects of cladding and anodizing on flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys --- semisubmersible platform
|NLR-TR-85006-U| p 604 N86-26430
Constant amplitude and flight simulation of fatigue tests on adhesive bonded lap joint specimens of 2024-T3 sheet material --- semisubmersible platform
|NLR-TR-84090-U| p 612 N86-26663

**FAULT TOLERANCE**
Application of analytical redundancy --- for flight safety
|SAE PAPER 851825| p 593 A86-38331

**FEASIBILITY ANALYSIS**
Formulating advanced 4 centistoke gas turbine oils - A feasibility study
|SAE PAPER 851833| p 601 A86-38531

**FEEDBACK CONTROL**
Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395

**FEEDFORWARD CONTROL**
Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339

**FIBER REINFORCED COMPOSITES**
The design of repairable advanced composite structures
|SAE PAPER 851830| p 606 A86-38335

**FIGHTER AIRCRAFT**
EAP - Fighter blueprint p 577 A86-37939
Computational aerodynamic design - X-29, the Gulfstream series and a tactical fighter
|SAE PAPER 851789| p 547 A86-38313
Optimization of a supersonic wing by combining linear and Euler methods
|SAE PAPER 851791| p 547 A86-38315
Requirements for future RALS/STOVL operating concepts --- Remote Augmented Lift System
|SAE PAPER 851840| p 578 A86-38337
The impact of technology on fighter aircraft requirements
|SAE PAPER 851841| p 579 A86-38338

Lightweight hydraulic system technology - 8000 psi update --- for military aircraft [SAE PAPER 851910] p 580 A86-38365

Techniques for sortie generation analysis [SAE PAPER 851950] p 618 A86-38376

Dynamic interactions between active control systems and a flexible aircraft structure [AIAA PAPER 86-0960] p 594 A86-38932

Aerospace knowledge magazine (selected articles) [AD-A164720] p 539 N86-26278

What USAF aircraft should be the Wild Weasel of the 1990's?: An assessment of the F-4G, the F-15WW, and F-16WW [AD-A164727] p 539 N86-26279

A demonstration expert system for implementing emergency procedures in a high-performance fighter aircraft [MAE-1749] p 569 N86-26295

The General Electric F404 - engine of the RAAF's new fighter [AD-A16456[illegible]] p 592 N86-26338

Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force [AD-A164864] p 599 N86-26346

New rotary rig at RAE and experiments on HIRM p 562 N86-27243

Standard dynamics model experiments with the DFVLR/AVA transonic derivative balance p 562 N86-27245

Recent experiences of unsteady aerodynamic effects on aircraft flight dynamics at high angle of attack p 564 N86-27252

Correlation of predicted and free-flight responses near departure conditions of a high incidence research model p 564 N86-27255

Theoretical prediction of wing rocking p 564 N86-27256

A self-organising control system for non-linear aircraft dynamics p 564 N86-27258

Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266

Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet [NASA-CR-178097] p 587 N86-27278

Static aeroelasticity in combat aircraft [AGARD-R-725] p 613 N86-27678

**FINITE ELEMENT METHOD**

Wave envelope and finite element approximations for turbofan noise radiation in flight p 619 A86-39057

Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements [AD-A165055] p 599 N86-27294

**FINITE VOLUME METHOD**

Influence of numerical dissipation in computing supersonic vortex-dominated flows [AIAA PAPER 86-1073] p 549 A86-38439

Thermodynamic evaluation of transonic compressor rotors using the finite volume approach [NASA-CR-176840] p 610 N86-26546

**FINNED BODIES**

Transonic flow solutions on a blunt, finned body of revolution using the Euler equations [AIAA PAPER 86-1082] p 549 A86-38445

**FIRE CONTROL**

Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253

**FIREPROOFING**

Controlled impact demonstration review --- for aircraft crashworthiness evaluation [SAE PAPER 851884] p 567 A86-38351

**FIRES**

Flammability of aircraft hydraulic fluids: A bibliography [AD-A165463] p 569 N86-26299

**FIXED WINGS**

Night vision by NVG with FLIR p 619 N86-26811

**FLAMMABILITY**

Flammability of aircraft hydraulic fluids: A bibliography [AD-A165463] p 569 N86-26299

**FLAT PLATES**

Accurate dynamic theory for supermaneuverable aircraft wings [AIAA PAPER 86-1006] p 585 A86-38947

Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system [AD-A165235] p 599 N86-27295

**FLEXIBLE BODIES**

Dynamic interactions between active control systems and a flexible aircraft structure [AIAA PAPER 86-0960] p 594 A86-38932

**FLEXIBLE WINGS**

Accurate dynamic theory for supermaneuverable aircraft wings [AIAA PAPER 86-1006] p 585 A86-38947

**FLIGHT ALTITUDE**

Lightning measurements of an aircraft flying at low altitude p 567 A86-37490

**FLIGHT CHARACTERISTICS**

Results of piloted simulation of Grumman Design 698 [SAE PAPER 851846] p 579 A86-38342

Classical flight dynamics of a variable forward-sweep-wing aircraft p 594 A86-39043

Validation of a new flying quality criterion for the landing task [NASA-TM-88261] p 595 N86-26341

Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing p 561 N86-27239

Dynamic nonlinear airloads: Representation and measurement p 563 N86-27251

Correlation of predicted and free-flight responses near departure conditions of a high incidence research model p 564 N86-27255

Theoretical prediction of wing rocking p 564 N86-27256

Highly Maneuverable Aircraft Technology (HiMAT) flight-flutter test program [NASA-TM-84907] p 596 N86-27290

**FLIGHT CONDITIONS**

The FAA Automated Weather Observing System (AWOS) p 613 A86-37459

Automation of surface observations program --- for improvement of meteorological services p 614 A86-37460

The center and central flow weather service unit program p 614 A86-37462

The classify, locate, and avoid wind shear (CLAWS) project at Denver's Stapleton International Airport - Operational testing of terminal weather hazard warnings with an emphasis on microburst wind shear p 615 A86-37495

The aviation weather forecasting task force - Assessing the current system p 616 A86-37504

The impact of private meteorology on private aviation p 616 A86-37511

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 5 of 1984 accidents [PB86-916901] p 570 N86-26305

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 6 of 1984 accidents [PB86-916902] p 570 N86-26306

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 7 of 1984 accidents [PB86-916903] p 570 N86-26307

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 8 of 1984 accidents [PB86-916904] p 570 N86-26308

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 9 of 1984 Accidents [PB86-916905] p 570 N86-26309

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 11 of 1984 accidents [PB86-916907] p 571 N86-26310

Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 13 of 1984 accidents [PB86-916909] p 571 N86-26311

**FLIGHT CONTROL**

Designing compact electromechanical actuators for flight control p 593 A86-37332

A real-time simulation of a non-linear RPV incorporating head-up type colour graphics p 593 A86-37335

Application of analytical redundancy --- for flight safety [SAE PAPER 851825] p 593 A86-38331

DIGITAC multimode control laws --- for military aircraft missions [SAE PAPER 851826] p 594 A86-38332

Use of the flight simulator in performing AFTI/F-16 airplane aeroservoelastic analysis [AIAA PAPER 86-0957] p 585 A86-38931

A demonstration expert system for implementing emergency procedures in a high-performance fighter aircraft [MAE-1749] p 569 N86-26295

Decoupling control synthesis for an oblique-wing aircraft [NASA-TM-86801] p 595 N86-26339

On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254

Highly Maneuverable Aircraft Technology (HiMAT) flight-flutter test program [NASA-TM-84907] p 596 N86-27290

**FLIGHT CREWS**

Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force [AD-A164864] p 599 N86-26346

**FLIGHT HAZARDS**

Aircraft icing observations and analysis p 576 A86-37465

The hazards of ash clouds to civil air transport p 566 A86-37477

Windshear detection using a Doppler acoustic sounder (SODAR) p 614 A86-37484

Wide area real-time thunderstorm mapping using LPATS - The lightning position and tracking system p 614 A86-37487

The classify, locate, and avoid wind shear (CLAWS) project at Denver's Stapleton International Airport - Operational testing of terminal weather hazard warnings with an emphasis on microburst wind shear p 615 A86-37495

Numerical simulation of precipitation induced downbursts p 615 A86-37496

Development of CAT detection and forecasting techniques for the profs central weather processor p 615 A86-37498

Use of computer technology in the operations of the national aviation weather advisory unit p 615 A86-37500

Prospects for destructive self-induced interactions in a vortex pair due to sinusoidal disturbances --- of large transport aircraft wakes [AIAA PAPER 86-1791] p 543 A86-37821

**FLIGHT INSTRUMENTS**

A demonstration expert system for implementing emergency procedures in a high-performance fighter aircraft [MAE-1749] p 569 N86-26295

Synthetic real-time relief display all-weather airborne missions p 589 N86-26321

**FLIGHT MECHANICS**

Gust alleviation on a transport airplane p 565 N86-27259

Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263

**FLIGHT OPTIMIZATION**

A minimum route time (MRT) program for microcomputers p 572 A86-39561

**FLIGHT PATHS**

A minimum route time (MRT) program for microcomputers p 572 A86-39561

Validation of a new flying quality criterion for the landing task [NASA-TM-88261] p 595 N86-26341

Aircraft information packet (Grand Canyon National Park, Arizona) [PB86-159704] p 540 N86-27179

**FLIGHT RECORDERS**

Method for determining the time delay of the pitot-static tubing system of aircraft --- semisubmersible platform [NLR-TR-83075-U] p 589 N86-26335

**FLIGHT SAFETY**

International Conference on the Aviation Weather System, 2nd, Universite du Quebec, Montreal, Canada, June 19-21, 1985, Preprints p 613 A86-37451

The safety and economic impact of improved aviation weather services p 613 A86-37454

NMC plans for improved aviation guidance --- using numerical weather prediction p 613 A86-37456

The center and central flow weather service unit program p 614 A86-37462

Application of analytical redundancy --- for flight safety [SAE PAPER 851825] p 593 A86-38331

Upper torso restraint systems --- for fixed wing and rotorcraft aircraft [SAE PAPER 851848] p 567 A86-38344

Low altitude wind-shear protection can be attained p 569 A86-39553

Integrated risk/cost planning models for the US Air Traffic system [NASA-CR-177274] p 573 N86-26312

National Transportation Safety Board safety recommendation [NTSB-4102C/300A] p 571 N86-27267

Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 17 of 1983 accidents [PB85-916918] p 571 N86-27269

**FLIGHT SIMULATION**

Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986 p 596 A86-37176

Effects of simulator variations on the fidelity of a UH-60 Black Hawk simulation p 596 A86-37178

Simulation support software in a real-time environment at the U.S. Air Force Flight Test Center p 617 A86-37180

CGI delay compensation --- Computer Generated Image p 617 A86-37194

Validation of a new flying quality criterion for the landing task [NASA-TM-88261] p 595 N86-26341

Engineering property comparisons for 2324-T39 and 2024-T351 aluminum alloy plate --- semisubmersible platform [NLR-TR-84021-U] p 603 N86-26429

Effects of cladding and anodizing on flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys --- semisubmersible platform [NLR-TR-85006-U] p 604 N86-26430

Constant amplitude and flight simulation of fatigue tests on adhesive bonded lap joint specimens of 2024-T3 sheet material --- semisubmersible platform |NLR-TR-84090-U| p 612 N86-26663

Dynamic nonlinear airloads: Representation and measurement p 563 N86-27251

On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254

Effects of aerodynamic lags on aircraft responses p 564 N86-27257

An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft |NAL-TR-893| p 587 N86-27277

A high-order language dor a system of closely coupled processing elements |NASA-CR-177280| p 619 N86-27930

**FLIGHT SIMULATORS**

Techniques for optimizing computer performance in real-time flight simulation p 617 A86-37177

Effects of simulator variations on the fidelity of a UH-60 Black Hawk simulation p 596 A86-37178

Putting humans into virtual space --- with visually coupled cockpit simulator p 588 A86-37193

Microcomputers and aviation --- Book p 567 A86-37625

Results of piloted simulation of Grumman Design 698 |SAE PAPER 851846| p 579 A86-38342

Use of the flight simulator in performing AFTI/F-16 airplane aeroservoelastic analysis |AIAA PAPER 86-0957| p 585 A86-38931

Flight simulator: Comparison of resolution thresholds for two light valve video projectors |AD-A164577| p 598 N86-26344

Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force |AD-A164864| p 599 N86-26346

A comparison of voice and keyboard data entry for a helicopter navigation task |AD-A163245| p 610 N86-26501

Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters |UTIAS-307| p 618 N86-27929

**FLIGHT TEST INSTRUMENTS**

Method for determining the time delay of the pitot-static tubing system of aircraft --- semisubmersible platform |NLR-TR-83075-U| p 589 N86-26335

**FLIGHT TESTS**

Simulation support software in a real-time environment at the U.S. Air Force Flight Test Center p 617 A86-37180

Flight test with a terrain aided navigation system p 571 A86-37334

Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft p 605 A86-38236

USAF Test Pilot School use of DIGITAC in systems testing |SAE PAPER 851827| p 594 A86-38333

A verification of propulsion and airplane performance models generated from flight |SAE PAPER 851899| p 580 A86-38362

Further results of natural laminar flow flight test experiments |SAE PAPER 850862| p 581 A86-38504

Low airspeed envelope determination of the CH-139 Jet Ranger helicopter p 586 A86-39565

Cost-effective remote-site testing --- of de Havilland aircraft p 539 A86-39570

Summary of results of NASA F-15 flight research program |NASA-TM-86811| p 539 N86-26277

X-29A technology demonstrator flight test program overview |NASA-TM-86809| p 586 N86-26328

Flight test guide for certification of transport category airplanes |FAA-AC-25-7| p 587 N86-26329

Aeroelastic control of oblique-wing aircraft |NASA-TM-86808| p 595 N86-26340

In-flight and wind tunnel leading-edge vortex study on the F-106B airplane p 557 N86-27198

Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics |AGARD-CP-386| p 560 N86-27224

Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing p 561 N86-27239

Extraction of aerodynamic parameters for aircraft at extreme flight conditions p 563 N86-27248

Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263

Highly Maneuverable Aircraft Technology (HiMAT) flight-flutter test program |NASA-TM-84907| p 596 N86-27290

Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system |AD-A165235| p 599 N86-27295

Operational flight experience and disassembly/inspection results of Space Shuttle orbiter actuators p 600 N86-27354

Analysis of helicopter noise data using international helicopter noise certification procedures |PB86-186533| p 620 N86-27972

**FLIGHT TRAINING**

Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force |AD-A164864| p 599 N86-26346

**FLIGHT VEHICLES**

Recurrent identification of unsteady aerodynamic forces of elastic vehicles p 554 A86-39762

**FLIR DETECTORS**

FLIR, NVG and HMS/D systems for helicopter operation: Review p 619 N86-26804

Night vision by NVG with FLIR p 619 N86-26811

**FLOORS**

A procedure to evaluate aircraft crash floor pulses |SAE PAPER 850854| p 582 A86-38513

**FLOTATION**

Aircraft flotation analysis - Current methods and perspective --- of ground performance evaluation |SAE PAPER 851936| p 580 A86-38369

**FLOW CHARACTERISTICS**

Wing profile in stalled position subject to a flow of alternating potential and strong vortex p 560 N86-27229

**FLOW CHARTS**

A microcomputer pollution model for civilian airports and Air Force bases |AD-A163232| p 616 N86-26714

**FLOW DEFLECTION**

Computation of transonic flow about helicopter rotor blades p 554 A86-39053

A method for the design of shock-free slender bodies of revolution p 554 A86-39054

Heat transfer and drag of a body in the far supersonic wake p 554 A86-39657

Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660

**FLOW DISTRIBUTION**

Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769

Euler calculation for flow over a wing in ground effect |AIAA PAPER 86-1765| p 542 A86-37803

Euler calculations for flowfield of a helicopter rotor in hover |AIAA PAPER 86-1782| p 577 A86-37849

The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes |AD-A164629| p 555 N86-26291

Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme |NAL-TR-889T| p 555 N86-27184

Extensions of the concept of suction analogy to prediction of vortex lift effect p 556 N86-27193

Laser velocimetry in highly three-dimensional and vortical flows p 557 N86-27197

Basic studies on delta wing flow modifications by means of apex fences p 557 N86-27199

An overview of the fundamental aerodynamics branch's research activities in wing leading-edge vortex flows at supersonic speeds p 558 N86-27207

Application of CFD techniques toward the validation of nonlinear aerodynamic models p 565 N86-27265

**FLOW GEOMETRY**

The use of curved higher order panels for vortex sheet modeling |AIAA PAPER 86-1812| p 544 A86-37833

Experiments on supersonic turbulent flow development in a square duct |AIAA PAPER 86-1038| p 548 A86-38412

Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter |AIAA PAPER 86-1069| p 548 A86-38436

**FLOW MEASUREMENT**

Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901

Comparison of hot-wire measurement techniques in a Mach 3 pilot quiet tunnel p 605 A86-38235

Experiments on supersonic turbulent flow development in a square duct |AIAA PAPER 86-1038| p 548 A86-38412

Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter |AIAA PAPER 86-1069| p 548 A86-38436

Design, development and operation of a high simultaneous capacity digital telemetry system p 613 N86-27632

**FLOW VELOCITY**

Plume characteristics of single-stream and dual-flow conventional and inverted-profile nozzles at equal thrust |NASA-TM-87323| p 554 N86-26285

Laser velocimetry in highly three-dimensional and vortical flows p 557 N86-27197

**FLOW VISUALIZATION**

Pulsed laser light sheet flow visualization p 605 A86-38237

Application of optical interferometry in compressible flows p 546 A86-38258

Wake imaging system applications at the Boeing Aerodynamics Laboratory |SAE PAPER 851895| p 606 A86-38358

The interaction between a strong longitudinal vortex and a turbulent boundary layer |AIAA PAPER 86-1071| p 549 A86-38437

Visualization of wing tip vortices in unsteady and steady wind |AIAA PAPER 86-1096| p 551 A86-38457

Three-dimensional unsteady flow fields elicited by a pitching forward swept wing |AIAA PAPER 86-1104| p 551 A86-38464

An experimental investigation of vortex breakdown on a delta wing p 557 N86-27196

In-flight and wind tunnel leading-edge vortex study on the F-106B airplane p 557 N86-27198

Vortex flow hysteresis p 558 N86-27201

Water tunnel results of leading-edge vortex flap tests on a delta wing vehicle p 558 N86-27208

Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil p 560 N86-27228

**FLUID PRESSURE**

Hydraulic pumps for high pressure non-flammable fluids --- for aircraft |SAE PAPER 851911| p 580 A86-38366

**FLUID-SOLID INTERACTIONS**

Durability prediction of parallel fuel tank skins with fluid-structure interaction dynamics |AIAA PAPER 86-0935| p 591 A86-38927

**FLUOROCARBONS**

Some aspects of fluorocarbon elastomer compatibility with gas turbine lubricants |SAE PAPER 851799| p 601 A86-38529

**FLUTTER**

Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406

On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254

Highly Maneuverable Aircraft Technology (HiMAT) flight-flutter test program |NASA-TM-84907| p 596 N86-27290

**FLUTTER ANALYSIS**

Application of the unsteady vortex-lattice method to the nonlinear two-degree-of-freedom aeroelastic equations |AIAA PAPER 86-0867| p 585 A86-38902

Effects of structural nonlinearities on limit cycle response of aerodynamic surfaces |AIAA PAPER 86-0899| p 585 A86-38910

An experimental study of the aerodynamics of incipient torsional stall flutter |AIAA PAPER 86-0901| p 553 A86-38912

A computational transonic flutter boundary tracking procedure |AIAA PAPER 86-0902| p 553 A86-38913

Stochastic flutter of nonlinear aeroelastic structures with parameter random fluctuations |AIAA PAPER 86-0962| p 609 A86-38934

Flutter of wings with leading edge control surfaces |AIAA PAPER 86-0897| p 585 A86-38950

Design of a flutter mode controller using positive real feedback p 594 A86-39041

Frequency domain synthesis of a robust flutter suppression control law p 594 A86-39042

Aeroelastic control of oblique-wing aircraft |NASA-TM-86808| p 595 N86-26340

Design, development and operation of a high simultaneous capacity digital telemetry system p 613 N86-27632

**FLY BY WIRE CONTROL**

Influence of FBW - Control laws on structural design of modern transport aircraft --- fly by wire |AIAA PAPER 86-0953| p 584 A86-38846

Failures in advanced flight control systems of future transport aircraft --- semisubmersible platform |NLR-TR-84108-U| p 595 N86-26343

**FLYING PLATFORMS**

Research on the technology of an airplane concept for a Stationary High-Altitude Relay Platform (SHARP) p 586 A86-39564

**FLYWHEELS**

'A flywheel powered RPV launcher - Putting theory into practice' p 590 A86-37344

**FOLDING STRUCTURES**
Folding tiltrotor technology demonstrator - The next step for tiltrotor technology
[SAE PAPER 851844] p 579 A86-38341

**FORCE DISTRIBUTION**
The generation of tire cornering forces in aircraft with a free-swiveling nose gear
[SAE PAPER 851939] p 581 A86-38372

**FORMULATIONS**
Nonskid coating formulations
[AD-D012186] p 604 N86-27457

**FRACTURE MECHANICS**
A study of cracking in the pressure bulkhead of a military transport aircraft
[AIAA PAPER 86-0983] p 584 A86-38861

**FRACTURE STRENGTH**
Engineering property comparisons for 2324-T39 and 2024-T351 aluminum alloy plate --- semisubmersible platform
[NLR-TR-84021-U] p 603 N86-26429

**FREE FLIGHT**
Wind tunnel free-flight test by a vertical drop technique at a hypersonic Mach number of 7 p 598 A86-38253

**FREE FLOW**
A method for estimating jet reaction control effectiveness
[AIAA PAPER 86-1805] p 593 A86-37828
Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901
Steady supersonic Navier-Stokes solutions of a 75 deg delta wing p 558 N86-27206
Review of SMP 1984 Symposium on Transonic Unsteady Aerodynamics and its Aeroelastic Applications
p 561 N86-27236
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
[AD-A165235] p 599 N86-27295

**FREQUENCY RESPONSE**
Frequency domain synthesis of a robust flutter suppression control law p 594 A86-39042

**FUEL COMBUSTION**
Properties of aircraft fuels and related materials
[AD-A164532] p 604 N86-27461

**FUEL CONSUMPTION**
Fuel conservative guidance for shipboard landing of powered-lift STOL aircraft p 572 A86-39048

**FUEL CONTAMINATION**
Development of the portable water separometer for the WSIM test
[SAE PAPER 851870] p 608 A86-38537
Properties of aircraft fuels and related materials
[AD-A164532] p 604 N86-27461

**FUEL CORROSION**
Gas and erosion corrosion of the combustion chambers of aircraft engines p 592 A86-39725

**FUEL TANKS**
Durability prediction of parallel fuel tank skins with fluid-structure interaction dynamics
[AIAA PAPER 86-0935] p 591 A86-38927
Impact damage to composite structures
[AGARD-R-729] p 604 N86-27425

**FUEL TESTS**
The influence of JFTOT operating parameters on the assessment of fuel thermal stability --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851871] p 602 A86-38538
Evaluation of JFTOT tube deposits by carbon burnoff --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851994] p 602 A86-38539

**FULL SCALE TESTS**
Full-scale tilt-rotor hover performance
p 576 A86-37770

**FUSELAGES**
A study of cracking in the pressure bulkhead of a military transport aircraft
[AIAA PAPER 86-0983] p 584 A86-38861
Unsteady transonic flow calculations for wing-fuselage configurations
[AIAA PAPER 86-0862] p 552 A86-38897

## G

**GAS DISSOCIATION**
A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application
p 591 A86-38994

**GAS TURBINE ENGINES**
A new approach to automated gas turbine engine testing p 597 A86-38070
Effects of section thickness and orientation on creep-rupture properties of two advanced single crystal alloys
[SAE PAPER 851785] p 601 A86-38309
Fabrication of ceramic components for advanced gas turbine engines
[SAE PAPER 851786] p 606 A86-38310
Processing study of injection molding of silicon nitride for engine applications
[SAE PAPER 851787] p 606 A86-38311
The significance of advanced technology engines on V/STOL systems
[SAE PAPER 851882] p 579 A86-38350
Aviation gas turbine lubricants - Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985
[SAE SP-633] p 607 A86-38526
Development of a high temperature jet engine oil - Laboratory and field evaluation
[SAE PAPER 851797] p 607 A86-38527
Some aspects of fluorocarbon elastomer compatibility with gas turbine lubricants
[SAE PAPER 851799] p 601 A86-38529
Formulating advanced 4 centistoke gas turbine oils - A feasibility study
[SAE PAPER 851833] p 601 A86-38531
Advanced lubricants for aircraft turbine engines
[SAE PAPER 851834] p 602 A86-38532
Future trends for U.S. Naval aviation propulsion system lubricants
[SAE PAPER 851835] p 608 A86-38533
Electrochemical evaluation of corrosivity in turbine engine oils
[SAE PAPER 851867] p 602 A86-38534
The influence of esters on elastomer seals
[SAE PAPER 851868] p 602 A86-38535
Deposition in gas turbine oil systems. I - Analysis and classification
[SAE PAPER 851869] p 602 A86-38536
The influence of JFTOT operating parameters on the assessment of fuel thermal stability --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851871] p 602 A86-38538
A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application
p 591 A86-38994
High-temperature lubrication systems for ring/liner applications in advanced heat engines
[AD-A164955] p 604 N86-26446
Design, development and operation of a high simultaneous capacity digital telemetry system
p 613 N86-27632

**GAS TURBINES**
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
[AD-A164629] p 555 N86-26291
Aircraft performance optimization with thrust vector control
[AD-A165388] p 587 N86-26134

**GAUSS EQUATION**
Aeroelastic control of oblique-wing aircraft
[NASA-TM-86808] p 595 N86-26340

**GEAR TEETH**
Linear dynamic coupling in geared rotor systems
[ASME PAPER 85-DET-11] p 608 A86-38617

**GEARS**
The generation of tire cornering forces in aircraft with a free-swiveling nose gear
[SAE PAPER 851939] p 581 A86-38372

**GENERAL AVIATION AIRCRAFT**
The impact of private meteorology on private aviation
p 616 A86-37511
General aviation aircraft aerodynamics; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
[SAE SP-621] p 581 A86-38501
An experimental study of a general aviation single-engine aircraft utilizing a natural laminar flow wing
[SAE PAPER 850861] p 551 A86-38503
An application of the Carson cruise optimum airspeed - A compromise between speed and efficiency
[SAE PAPER 850867] p 582 A86-38508
Crash dynamics of general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
[SAE SP-622] p 582 A86-38509
Data for the development of criteria for general aviation seat and restraint system performance
[SAE PAPER 850851] p 568 A86-38511
Preliminary design research for the Caravan 1 crew seat
[SAE PAPER 850856] p 582 A86-38514
Composites. Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
[SAE SP-623] p 582 A86-38515
KRASH85 user's guide: Input/output format
[DOT/FAA/CT-85/10-REV] p 618 N86-27926

**GLIDE PATHS**
Math model study of a proposed glide slope for runway 13R, Dallas-Fort Worth Airport, Texas
[AD-A164907] p 573 N86-26315

**GLIDERS**
High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329

**GRAND CANYON (AZ)**
Aircraft information packet (Grand Canyon National Park, Arizona)
[PB86-159704] p 540 N86-27179

**GRAPHITE-EPOXY COMPOSITES**
Design and certification of a composite control surface
[SAE PAPER 850888] p 582 A86-38516
Observations on compressive local buckling, postbuckling and crippling of graphite/epoxy airframe structure
[AIAA PAPER 86-0923] p 608 A86-38833
Experimental aeroelastic behavior of forward swept graphite/epoxy wings with rigid body freedoms
[AIAA PAPER 86-0971] p 584 A86-38851

**GROUND BASED CONTROL**
Ground control station for RPVs p 571 A86-37336
Integrated braking and ground directional control for tactical aircraft
[SAE PAPER 851941] p 581 A86-38374
Microwave Landing System (MLS) station interface control report
[DOT/FAA/PM-86/17] p 540 N86-27178

**GROUND EFFECT (AERODYNAMICS)**
Euler calculation for flow over a wing in ground effect
[AIAA PAPER 86-1765] p 542 A86-37803

**GROUND OPERATIONAL SUPPORT SYSTEM**
Generic aircraft ground operation simulation
[AIAA PAPER 86-0989] p 584 A86-38865

**GROUND STATIONS**
Ground control station for RPVs p 571 A86-37336

**GROUND SUPPORT EQUIPMENT**
Aircraft ground support equipment standardization - The pros and cons of 'functional' vs 'technical' standardization
[SAE PAPER 851794] p 620 A86-38317

**GROUND TESTS**
Ground testing approach for the B-1B bomber
[SAE PAPER 851796] p 598 A86-38319

**GROUND WIND**
Terrain-induced wind shear - Potential cause of Jetstar accident p 566 A86-37482

**GRUMMAN AIRCRAFT**
Results of piloted simulation of Grumman Design 698
[SAE PAPER 851846] p 579 A86-38342

**GUIDANCE SENSORS**
Improvement of strapdown system performance by means of numerical methods
[BMFT-FB-W-85-011] p 575 N86-27275

**GUIDE VANES**
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
[AD-A164629] p 555 N86-26291

**GUN TURRETS**
The Phoenix sensor turret system
p 588 A86-37342

**GUST ALLEVIATORS**
Gust alleviation on a transport airplane
p 565 N86-27259
Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261
Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263

**GUST LOADS**
Gust response of hingeless rotors
p 576 A86-37772
A wind tunnel study of active control technology on a high aspect ratio wing
[AIAA PAPER 86-0956] p 594 A86-38930
The equivalent deterministic function of the Dryden's spectra of atmospheric turbulence and its application to the aircraft response problem p 595 A86-39768
Wind tunnel test and analysis on gust load alleviation of a high-aspect-ratio wing
[NAL-TR-890] p 556 N86-27185
Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247
Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261

**GUSTS**
Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263

H

**HANDBOOKS**
Transportation safety recommendations adopted during the month of December 1985
[PB85-916612] p 569 N86-26301
**HARNESSES**
Upper torso restraint systems --- for fixed wing and rotorcraft aircraft
[SAE PAPER 851848] p 567 A86-38344
**HARRIER AIRCRAFT**
Effects of jet flap on AV8-B 'Harrier' performance
[SAE PAPER 851843] p 579 A86-38340
Harrier III-AV8B with a modern engine
[SAE PAPER 851881] p 579 A86-38349
**HEAD-UP DISPLAYS**
A real-time simulation of a non-linear RPV incorporating head-up type colour graphics p 593 A86-37335
**HEALTH PHYSICS**
The F-16 aircraft and hydrazine - An industrial hygiene perspective
[SAE PAPER 851971] p 568 A86-38381
**HEAT RESISTANT ALLOYS**
Effects of section thickness and orientation on creep-rupture properties of two advanced single crystal alloys
[SAE PAPER 851785] p 601 A86-38309
**HELICOPTER CONTROL**
Multi-input multi-output automatic design synthesis for performance and robustness p 618 A86-39034
Low airspeed envelope determination of the CH-139 Jet Ranger helicopter p 586 A86-39565
Six degree-of-freedom LIVE isolation systems, part 1
[NASA-CR-177928] p 587 N86-26331
**HELICOPTER DESIGN**
The development of Z-2 Remotely Piloted Helicopter
p 575 A86-37328
Strength evaluation of helicopter composite bolted joints
[AIAA PAPER 86-0973] p 608 A86-38853
Six-force-factor identification of helicopters
p 586 A86-39763
Six degree-of-freedom LIVE isolation systems, part 1
[NASA-CR-177928] p 587 N86-26331
**HELICOPTER ENGINES**
Preliminary evaluation of a compound cycle engine for shipboard gensets
[NASA-CR-179451] p 611 N86-26629
**HELICOPTER PERFORMANCE**
Gust response of hingeless rotors
p 576 A86-37772
**HELICOPTERS**
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
Recent developments in the dynamics of advanced rotor systems. I p 586 A86-39597
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
[AD-A164828] p 569 N86-26298
Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force
[AD-A164864] p 599 N86-26346
A comparison of voice and keyboard data entry for a helicopter navigation task
[AD-A163245] p 610 N86-26501
Helicopter noise p 560 N86-27223
Dynamic stall of swept and unswept oscillating wings
p 560 N86-27226
A critical look at dynamic simulation of viscous flow
p 560 N86-27230
Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241
Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project
[AD-A165073] p 575 N86-27273
Analysis of helicopter noise data using international helicopter noise certification procedures
[PB86-186533] p 620 N86-27972
**HELIPORTS**
Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project
[AD-A165073] p 575 N86-27273
**HELMET MOUNTED DISPLAYS**
The wide field helmet mounted display
p 589 N86-26322
**HEMISPHERE CYLINDER BODIES**
Counterflow sonic nosejet into a supersonic stream
[AIAA PAPER 86-1808] p 544 A86-37830
**HIGH ALTITUDE**
High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329
**HIGH ASPECT RATIO**
Divergence study of a high-aspect ratio, forward-swept wing
[NASA-TM-87682] p 588 N86-27279
**HIGH LEVEL LANGUAGES**
A high-order language dor a system of closely coupled processing elements
[NASA-CR-177280] p 619 N86-27930
**HIGH PRESSURE**
Lightweight hydraulic system technology - 8000 psi update --- for military aircraft
[SAE PAPER 851910] p 580 A86-38365
Hydraulic pumps for high pressure non-flammable fluids --- for aircraft
[SAE PAPER 851911] p 580 A86-38366
Multistage metal hydride compressor
[DE86-001965] p 604 N86-27465
**HIGH SPEED**
Flight test guide for certification of transport category airplanes
[FAA-AC-25-7] p 587 N86-26329
**HIGH TEMPERATURE LUBRICANTS**
Development of a high temperature jet engine oil - Laboratory and field evaluation
[SAE PAPER 851797] p 607 A86-38527
Advanced lubricants for aircraft turbine engines
[SAE PAPER 851834] p 602 A86-38532
Future trends for U.S. Naval aviation propulsion system lubricants
[SAE PAPER 851835] p 608 A86-38533
High-temperature lubrication systems for ring/liner applications in advanced heat engines
[AD-A164955] p 604 N86-26446
**HIGHLY MANEUVERABLE AIRCRAFT**
Highly Maneuverable Aircraft Technology (HiMAT) flight-flutter test program
[NASA-TM-84907] p 596 N86-27290
**HISTORIES**
Investigations in the history and theory of the development of aviation and space science and technology. Number 4 --- Russian book
p 620 A86-39984
**HODOGRAPHS**
A spectral hodograph method for shockless transonic two-dimensional flow
[AIAA PAPER 86-1796] p 543 A86-37824
**HOLOGRAPHIC INTERFEROMETRY**
Application of optical interferometry in compressible flows p 546 A86-38258
**HORIZONTAL FLIGHT**
Effectiveness of current dynamic-inflow models in hover and forward flight p 576 A86-37773
**HOT CORROSION**
Gas and erosion corrosion of the combustion chambers of aircraft engines p 592 A86-39725
**HOT-FILM ANEMOMETERS**
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236
**HOT-WIRE ANEMOMETERS**
Comparison of hot-wire measurement techniques in a Mach 3 pilot quiet tunnel p 605 A86-38235
**HOVERING**
Full-scale tilt-rotor hover performance
p 576 A86-37770
Gust response of hingeless rotors
p 576 A86-37772
Effectiveness of current dynamic-inflow models in hover and forward flight p 576 A86-37773
Euler solutions for the flow around a hovering helicopter rotor
[AIAA PAPER 86-1784] p 543 A86-37815
Euler calculations for flowfield of a helicopter rotor in hover
[AIAA PAPER 86-1782] p 577 A86-37849
Estimation of lift losses of hovering vehicles using a single jet
[SAE PAPER 851842] p 579 A86-38339
**HUBS**
Experimental investigation of rotorcraft hub and shaft fairing drag reduction
[AIAA PAPER 86-1783] p 577 A86-37814
**HUMAN BEINGS**
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
[AD-A164828] p 569 N86-26298
**HUMAN FACTORS ENGINEERING**
Some quantitative methodology for cockpit design
p 586 N86-26320
Flight simulator: Comparison of resolution thresholds for two light valve video projectors
[AD-A164577] p 598 N86-26344
A comparison of voice and keyboard data entry for a helicopter navigation task
[AD-A163245] p 610 N86-26501
**HUMIDITY**
A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application
p 591 A86-38894
**HYDRAULIC CONTROL**
Large-Scale Advanced Prop-Fan (LAP) pitch change actuator and control design report
[NASA-CR-174786] p 592 N86-27282
**HYDRAULIC EQUIPMENT**
Ground testing approach for the B-1B bomber
[SAE PAPER 851796] p 598 A86-38319
**HYDRAULIC FLUIDS**
Nonflammable fluid and 8,000 psi technology for future aircraft hydraulic systems (22 CFR 125.4 /b/ /13/ applicable)
[SAE PAPER 851909] p 580 A86-38364
Hydraulic pumps for high pressure non-flammable fluids --- for aircraft
[SAE PAPER 851911] p 580 A86-38366
Flammability of aircraft hydraulic fluids: A bibliography
[AD-A165463] p 569 N86-26299
**HYDRAZINE ENGINES**
Design, safety, and maintainability aspects for hydrazine use in emergency secondary power systems
[SAE PAPER 851972] p 568 A86-38382
**HYDRAZINES**
The F-16 aircraft and hydrazine - An industrial hygiene perspective
[SAE PAPER 851971] p 568 A86-38381
Evaluation of less toxic fuels for aircraft emergency power systems
[SAE PAPER 851974] p 601 A86-38384
**HYDROCARBON FUELS**
Properties of aircraft fuels and related materials
[AD-A164537] p 604 N86-27461
**HYDROGEN**
Multistage metal hydride compressor
[DE86-001965] p 604 N86-27465
**HYPERSONIC BOUNDARY LAYER**
Laminar boundary layer stability experiments on a cone at Mach 8. IV - On unit Reynolds number and environmental effects
[AIAA PAPER 86-1087] p 550 A86-38449
Wall cooling effects on hypersonic boundary layer transition, M(1) = 7.5 - 15
[AIAA PAPER 86-1088] p 550 A86-38450
**HYPERSONIC FLOW**
Wind tunnel free-flight test by a vertical drop technique at a hypersonic Mach number of 7 p 598 A86-38253
**HYPERSONIC HEAT TRANSFER**
Wall cooling effects on hypersonic boundary layer transition, M(1) = 7.5 - 15
[AIAA PAPER 86-1088] p 550 A86-38450
**HYPERSONIC SPEED**
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
[AIAA PAPER 86-0978] p 609 A86-38857
**HYSTERESIS**
Vortex flow hysteresis p 559 N86-27201

I

**ICE FORMATION**
Aircraft icing observations and analysis
p 576 A86-37465
Experimental measurements of heat transfer from an iced surface during artificial and natural cloud icing conditions
[AIAA PAPER 86-1352] p 598 A86-39946
Calibration of droplet sizing and liquid water content instruments: Survey and analysis
[NASA-CR-175099] p 611 N86-26596
**ICE PREVENTION**
Analyses and tests for design of an electro-impulse de-icing system
[NASA-CR-174919] p 571 N86-27268
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
[NASA-CR-177260] p 599 N86-27291
**IMAGE CONTRAST**
Flight simulator: Comparison of resolution thresholds for two light valve video projectors
[AD-A164577] p 598 N86-26344
**IMAGING TECHNIQUES**
A thermal imaging payload for RPV applications
p 588 A86-37333
Wake imaging system applications at the Boeing Aerodynamics Laboratory
[SAE PAPER 851895] p 606 A86-38358
**IMPACT DAMAGE**
Impact damage to composite structures
[AGARD-R-729] p 604 N86-27425

**IMPACT RESISTANCE**

Controlled impact demonstration review --- for aircraft crashworthiness evaluation
|SAE PAPER 851884| p 567 A86-38351

Safety report General Aviation Crashworthiness Project. Phase 3: Acceleration loads and velocity changes of survivable general aviation accidents
|PB85-9[illegible]7016| p 569 N86-26302

**IMPACT STRENGTH**

Nonskid coating formulations
|AD-D012186| p 604 N86-27457

**IMPACT TESTS**

FAA structural crash dynamics program update - Transport category aircraft
|SAE PAPER 851887| p 568 A86-38354

Preliminary design research for the Caravan 1 crew seat
|SAE PAPER 850856| p 582 A86-38514

**IMPEDANCE**

Analysis of direct and nearby lightning strike data for aircraft
|NASA-CR-172127| p 617 N86-27855

**IN-FLIGHT MONITORING**

Lightning measurements of an aircraft flying at low altitude p 567 A86-37490

**INCIDENCE**

Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence --- graph theory
|NLR-MP-84040-U| p 555 N86-26293

**INCOMPRESSIBLE FLOW**

An implicit flux-difference splitting scheme for three-dimensional, incompressible Navier-Stokes solutions to leading edge vortex flows
|AIAA PAPER 86-1839| p 546 A86-37847

Reduced Navier-Stokes (RNS relaxation procedure for internal flows with interaction)
|SAE PAPER 851790| p 547 A86-38314

Application of the vortex-lattice method to high-angle-of-attack subsonic aerodynamics
|SAE PAPER 851817| p 547 A86-38326

A direct and inverse boundary layer method for subsonic flow over delta wings p 557 N86-27195

A vortex point method for calculating inviscid incompressible flows around rotary wings
p 612 N86-27219

**INDUSTRIAL SAFETY**

The F-16 aircraft and hydrazine - An industrial hygiene perspective
|SAE PAPER 851971| p 568 A86-38381

**INERTIAL NAVIGATION**

Flight test with a terrain aided navigation system
p 571 A86-37334

**INFINITE SPAN WINGS**

Analysis of transitional separation bubbles on infinite swept wings
|NASA-CR-3956| p 555 N86-26288

**INFORMATION DISSEMINATION**

The impact of private meteorology on private aviation
p 616 A86-37511

**INFORMATION SYSTEMS**

An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures
|AD-A165588| p 540 N86-26282

**INFRARED IMAGERY**

A thermal imaging payload for RPV applications
p 588 A86-37333

**INFRARED TELESCOPES**

Thermal zoom optics for R.P.V. sensors
p 588 A86-37341

**INGOTS**

Ingot metallurgy aluminum - Lithium alloys for aircraft structure
|AIAA PAPER 86-0890| p 603 A86-38022

**INJECTION MOLDING**

Processing study of injection molding of silicon nitride for engine applications
|SAE PAPER 851787| p 606 A86-38311

**INJURIES**

Human injury criteria relative to civil aircraft seat and restraint systems
|SAE PAPER 851847| p 567 A86-38343

**INLET FLOW**

Review of dynamic inflow modeling for rotorcraft flight dynamics
|AIAA PAPER 86-0845| p 584 A86-38893

**INSTRUMENT COMPENSATION**

CGI delay compensation --- Computer Generated Image p 617 A86-37194

**INSTRUMENT FLIGHT RULES**

Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project
|AD-A165073| p 575 N86-27273

**INSTRUMENT LANDING SYSTEMS**

Math model study of a proposed glide slope for runway 13R, Dallas-Fort Worth Airport, Texas
|AD-A164907| p 573 N86-26315

**INTAKE SYSTEMS**

The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
|AD-A164629| p 555 N86-26291

The General Electric F404 - engine of the RAAF's new fighter
|AD-A164562| p 592 N86-26338

**INTERACTIONAL AERODYNAMICS**

Vortex-induced bending oscillation of a swept wing
|AIAA PAPER 86-1773| p 542 A86-37809

Prospects for destructive self-induced interactions in a vortex pair due to sinusoidal disturbances --- of large transport aircraft wakes
|AIAA PAPER 86-1791| p 543 A86-37821

Three-dimensional interaction of wakes and boundary layers
|AIAA PAPER 86-1820| p 545 A86-37838

The interaction between a strong longitudinal vortex and a turbulent boundary layer
|AIAA PAPER 86-1071| p 549 A86-38437

**INTERFACES**

Mechanical interface devices for automatic test equipment
|SAE PAPER 851795| p 606 A86-38318

Microwave Landing System (MLS) station interface control report
|DOT/FAA/PM-86/17| p 540 N86-27178

**INTERNAL COMBUSTION ENGINES**

Preliminary evaluation of a compound cycle engine for shipboard gensets
|NASA-CR-179451| p 611 N86-26629

**INVENTORIES**

A microcomputer pollution model for civilian airports and Air Force bases
|AD-A163232| p 616 N86-26714

**INVISCID FLOW**

Inviscid and viscous simulations of high angle of attack flows
|SAE PAPER 851820| p 548 A86-38328

Three-dimensional inviscid flow in mixers. I - Mixer analysis using a Cartesian grid p 554 A86-39090

Analysis of transitional separation bubbles on infinite swept wings
|NASA-CR-3956| p 555 N86-26288

Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible?
|AGARD-R-723-ADD-1| p 556 N86-27187

A vortex point method for calculating inviscid incompressible flows around rotary wings
p 612 N86-27219

Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations: Dynamic stall
p 561 N86-27231

**ISOLATION**

Six degree-of-freedom LIVE isolation systems, part 1
|NASA-CR-177928| p 587 N86-28331

## J

**JAMMING**

A technique to evaluate the accessibility of airborne receivers to interfering signals p 572 A86-37555

**JET AIRCRAFT**

Structural analysis of the controlled impact demonstration of a jet transport airplane
|AIAA PAPER 86-0939| p 583 A86-388[illegible]6

What USAF aircraft should be the Wild Weasel of the 1990's?: An assessment of the F-4G, the F-15WW, and F-16WW
|AD-A164727| p 539 N86-26279

The General Electric F404 - engine of the RAAF's new fighter
|AD-A164562| p 592 N86-26338

Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force
|AD-A164864| p 599 N86-26346

Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet
|NASA-CR-178097| p 587 N86-27278

A high-order language dor a system of closely coupled processing elements
|NASA-CR-177280| p 619 N86-27930

**JET AIRCRAFT NOISE**

Wave envelope and finite element approximations for turbofan noise radiation in flight p 619 A86-39057

Fine structure of subsonic jet noise
p 619 A86-39069

**JET ENGINE FUELS**

Aviation fuels technology --- Book
p 601 A86-38266

Development of the portable water seperometer for the WSIM test
|SAE PAPER 851870| p 608 A86-38537

The influence of JFTOT operating parameters on the assessment of fuel thermal stability --- Jet Fuel Thermal Oxidation Tester
|SAE PAPER 851871| p 602 A86-38538

Evaluation of JFTOT tube deposits by carbon burnoff --- Jet Fuel Thermal Oxidation Tester
|SAE PAPER 851994| p 602 A86-38539

Properties of aircraft fuels and related materials
|AD-A164532| p 604 N86-27461

**JET ENGINES**

Development of a high temperature jet engine oil - Laboratory and field evaluation
|SAE PAPER 851797| p 607 A86-38527

The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
|AD-A164629| p 555 N86-26291

**JET EXHAUST**

Plume characteristics of single-stream and dual-flow conventional and inverted-profile nozzles at equal thrust
|NASA-TM-87323| p 554 N86-26285

**JET FLAPS**

Effects of jet flap on AV8-B 'Harrier' performance
|SAE PAPER 851843| p 579 A86-38340

**JET FLOW**

Aerodynamic characteristics of a circulation controlled symmetrical airfoil with dual jet p 541 A86-37196

A method for estimating jet reaction control effectiveness
|AIAA PAPER 86-1805| p 593 A86-37828

Counterflow sonic nosejet into a supersonic stream
|AIAA PAPER 86-1808| p 544 A86-37830

Plume characteristics of single-stream and dual-flow conventional and inverted-profile nozzles at equal thrust
|NASA-TM-87323| p 554 N86-26285

**JET MIXING FLOW**

Progress in the development of parabolized Navier-Stokes (PNS) methodology for analyzing propulsive jet mixing problems
|AIAA PAPER 86-1115| p 551 A86-38473

**JET PROPULSION**

Estimation of lift losses of hovering vehicles using a single jet
|SAE PAPER 851842| p 579 A86-38339

**JOINTS (JUNCTIONS)**

Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter
|AIAA PAPER 86-1069| p 548 A86-38436

Strength evaluation of helicopter composite bolted joints
|AIAA PAPER 86-0973| p 608 A86-38853

Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
|AD-A165289| p 603 N86-26384

Optimized bolted joint
|NASA-CASE-LAR-13250-1| p 612 N86-27630

**JOUKOWSKI TRANSFORMATION**

Modelling of the vortex-airfoil interaction
p 565 N86-27262

## K

**KALMAN FILTERS**

An terrain-aided guidance system with high convergence speed p 573 A86-39766

**KERNEL FUNCTIONS**

Lifting surface theory for the rest of us
|AIAA PAPER 86-1025| p 552 A86-38880

**KEROSENE**

Antimisting fuel technology for transport category aircraft
|SAE PAPER 851886| p 568 A86-38353

**KEVLAR (TRADEMARK)**

Design and use of Kevlar in aircraft structures
|SAE PAPER 850893| p 583 A86-38520

**KNOWLEDGE**

A demonstration expert system for implementing emergency procedures in a high-performance fighter aircraft
|MAE-1749| p 569 N86-26295

**KUTTA-JOUKOWSKI CONDITION**

Unsteady vortex airfoil interaction p 562 N86-27240

## L

**LABORATORY EQUIPMENT**

Wake imaging system applications at the Boeing Aerodynamics Laboratory |SAE PAPER 851895| p 606 A86-38358

**LAMINAR BOUNDARY LAYER**

Laminar boundary layer stability experiments on a cone at Mach 8. IV - On unit Reynolds number and environmental effects |AIAA PAPER 86-1087| p 550 A86-38449

An investigation of the effects of the propeller slipstream of a laminar wing boundary layer |SAE PAPER 850859| p 551 A86-38502

Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence --- graph theory |NLR-MP-84040-U| p 555 N86-26293

**LAMINAR FLOW**

Swept wing-tip shapes for low-speed airplanes |SAE PAPER 851770| p 546 A86-38305

A faster 'transition' to laminar flow |SAE PAPER 851855| p 548 A86-38347

Experimental determination of the laminar separation bubble characteristics on an airfoil at low Reynolds numbers |AIAA PAPER 86-1065| p 548 A86-38433

Effects of cone surface waviness and freestream noise on transition in supersonic flow |AIAA PAPER 86-1086| p 550 A86-38448

Natural laminar flow and regional aircraft |SAE PAPER 850864| p 552 A86-38505

Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible? |AGARD-R-723-ADD-1| p 556 N86-27187

Steady supersonic Navier-Stokes solutions of a 75 deg delta wing p 558 N86-27206

**LAMINAR FLOW AIRFOILS**

An investigation of the effects of the propeller slipstream of a laminar wing boundary layer |SAE PAPER 850859| p 551 A86-38502

An experimental study of a general aviation single-engine aircraft utilizing a natural laminar flow wing |SAE PAPER 850861| p 551 A86-38503

Further results of natural laminar flow flight test experiments |SAE PAPER 850862| p 581 A86-38504

**LAMINATES**

Buckling and final failure of graphite/PEEK stiffener sections |AIAA PAPER 86-0921| p 608 A86-38831

The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression --- semisubmersible platform |NLR-MP-85019-U| p 611 N86-26661

**LANDING**

TCAS Experimental Unit (TEU) hardware description |FAA/PM-85/21| p 574 N86-27272

**LANDING AIDS**

Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project |AD-A165073| p 575 N86-27273

**LANDING GEAR**

Laboratory simulation of landing gear pitch-plane dynamics |SAE PAPER 851937| p 598 A86-38370

European aircraft steering systems |SAE PAPER 851940| p 581 A86-38373

Aircraft wheel design and proving p 583 A86-38721

**LANDING SIMULATION**

Laboratory simulation of landing gear pitch-plane dynamics |SAE PAPER 851937| p 598 A86-38370

**LANDING SITES**

Use of NDE to evaluate reflection cracking in airfield pavements |AD-A164880| p 599 N86-27293

Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements |AD-A165055| p 599 N86-27294

**LAP JOINTS**

Effects of cladding and anodizing en flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys --- semisubmersible platform |NLR-TR-85006-U| p 604 N86-26430

Constant amplitude and flight simulation of fatigue tests on adhesive bonded lap joint specimens of 2024-T3 sheet material --- semisubmersible platform |NLR-TR-84090-U| p 612 N86-26663

**LAPLACE TRANSFORMATION**

A calculation method for unsteady aerodynamic forces in the Laplace domain and its application to root loci |AIAA PAPER 86-0866| p 553 A86-38901

**LARGE SPACE STRUCTURES**

Optimum design of large structures with multiple constraints |AIAA PAPER 86-0952| p 600 A86-38845

**LASER APPLICATIONS**

Pulsed laser light sheet flow visualization p 605 A86-38237

Calibration of droplet sizing and liquid water content instruments: Survey and analysis |NASA-CR-175099| p 611 N86-26596

**LASER DOPPLER VELOCIMETERS**

Laser velocimetry in highly three-dimensional and vortical flows p 557 N86-27197

**LATERAL CONTROL**

Decoupling control synthesis for an oblique-wing aircraft |NASA-TM-86801| p 595 N86-26339

**LATERAL STABILITY**

A computer programme for DATCOM methods of estimation of lateral stability and control derivatives |NAL-TM-AE-8601| p 596 N86-2728

**LEADING EDGE FLAPS**

Analytical observations on the aerodynamics of a delta wing with leading edge flaps |AIAA PAPER 86-1790| p 543 A86-37820

Flutter of wings with leading edge control surfaces |AIAA PAPER 86-0897| p 585 A86-38950

**LEADING EDGE SLATS**

Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method |NAL-TM-AE-8507| p 559 N86-27212

**LEADING EDGES**

An implicit flux-difference splitting scheme for three-dimensional, incompressible Navier-Stokes solutions to leading edge vortex flows |AIAA PAPER 86-1839| p 546 A86-37847

Leading-edge design for improved spin resistance of wings incorporating conventional and advanced airfoils |SAE PAPER 851816| p 578 A86-38325

A three-dimensional boundary-layer method for flow over delta wings with leading-edge separation |SAE PAPER 851818| p 547 A86-38327

Leading-edge vortex research: Some nonplanar concepts and current challenges p 556 N86-27192

Recent extensions to the free-vortex-sheet theory for expended convergence capability p 556 N86-27194

An Euler aerodynamic method for leading-edge vortex flow simulation p 558 N86-27203

Computation of leading-edge vortex flows p 558 N86-27205

An overview of the fundamental aerodynamics branch's research activities in wing leading-edge vortex flows at supersonic speeds p 558 N86-27207

Water tunnel results of leading-edge vortex flap tests on a delta wing vehicle p 558 N86-27208

Experimental study of the effect of turbulence on dynamic stalling p 565 N86-27264

**LIE GROUPS**

Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395

**LIFT**

Estimation of lift losses of hovering vehicles using a single jet |SAE PAPER 851842| p 579 A86-38339

Lifting surface theory for the rest of us |AIAA PAPER 86-1025| p 552 A86-38880

Vortex lift research: Early contributions and some current challenges p 556 N86-27191

Extensions of the concept of suction analogy to prediction of vortex lift effect p 556 N86-27193

Effects of aerodynamic lags on aircraft responses p 564 N86-27257

**LIFT AUGMENTATION**

Requirements for future RALS/STOVL operating concepts --- Remote Augmented Lift System |SAE PAPER 851840| p 578 A86-38337

**LIFT DEVICES**

Aerodynamic characteristics of a circulation controlled symmetrical airfoil with dual jet p 541 A86-37196

Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method |NAL-TM-AE-8507| p 559 N86-27212

**LIFT DRAG RATIO**

An application of the Carson cruise optimum airspeed - A compromise between speed and efficiency |SAE PAPER 850867| p 582 A86-38508

**LIFTING BODIES**

Lifting surface theory for the rest of us |AIAA PAPER 86-1025| p 552 A86-38880

Integrated aeroservoelastic tailoring of lifting surfaces |AIAA PAPER 86-1005| p 594 A86-38946

Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660

Theoretical prediction of wing rocking p 564 N86-27256

**LIGHT AIRCRAFT**

Research on the technology of an airplane concept for a Stationary High-Altitude Relay Platform (SHARP) p 586 A86-39564

**LIGHTNING**

NASA storm hazards research in lightning strikes to aircraft p 566 A86-37479

Wide area real-time thunderstorm mapping using LPATS - The lightning position and tracking system p 614 A86-37487

Lightning measurements of an aircraft flying at low altitude p 567 A86-37490

Lightning discharge protection rod |NASA-CASE-LAR-13470-1| p 569 N86-26296

Analysis of direct and nearby lightning strike data for aircraft |NASA-CR-172127| p 617 N86-27855

**LINE OF SIGHT COMMUNICATION**

A technique to evaluate the accessibility of airborne receivers to interfering signals p 572 A86-37555

**LINEAR EQUATIONS**

Aeroelastic control of oblique-wing aircraft |NASA-TM-86808| p 595 N86-26340

**LINEAR SYSTEMS**

Linear dynamic coupling in geared rotor systems |ASME PAPER 85-DET-11| p 606 A86-38617

**LIQUID OXYGEN**

Oxygen chemisorption cryogenic refrigerator |NASA-CASE-NPO-16734-1-CU| p 612 N86-27467

**LITHIUM ALLOYS**

Ingot metallurgy aluminum - Lithium alloys for aircraft structure |AIAA PAPER 86-0890| p 603 A86-38822

**LOAD TESTS**

The postbuckling behavior of blade stiffened carbon epoxy panels loaded in compression --- semisubmersible platform |NLR-MP-85019-U| p 611 N86-26661

**LOADS (FORCES)**

Recent developments in the dynamics of advanced rotor systems. I p 586 A86-39597

**LOCKHEED AIRCRAFT**

National Transportation Safety Board safety recommendation |NTSB-4102C/300A| p 571 N86-27267

**LONGITUDINAL CONTROL**

Pivotable strakes for high angle of attack control |SAE PAPER 851821| p 593 A86-38329

The equivalent deterministic function of the Dryden's spectra of atmospheric turbulence and its application to the aircraft response problem p 595 A86-39768

Decoupling control synthesis for an oblique-wing aircraft |NASA-TM-86801| p 595 N86-26339

**LOW ALTITUDE**

Lightning measurements of an aircraft flying at low altitude p 567 A86-37490

Low altitude wind-shear protection can be attained p 569 A86-39553

**LOW ASPECT RATIO WINGS**

Analytical observations on the aerodynamics of a delta wing with leading edge flaps |AIAA PAPER 86-1790| p 543 A86-37820

**LOW REYNOLDS NUMBER**

Experimental determination of the laminar separation bubble characteristics on an airfoil at low Reynolds numbers |AIAA PAPER 86-1065| p 548 A86-38433

Proceedings of the Conference on Low Reynolds Number Airfoil Aerodynamics |NASA-CR-177308| p 540 N86-26283

**LOW SPEED**

Swept wing-tip shapes for low-speed airplanes |SAE PAPER 851770| p 546 A86-38305

**LOW SPEED WIND TUNNELS**

Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406

A wind tunnel study of active control technology on a high aspect ratio wing |AIAA PAPER 86-0956| p 594 A86-38930

**LOW TEMPERATURE**

Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing |AIAA PAPER 86-1019| p 609 A86-38876

**LUBRICANTS**

Aviation gas turbine lubricants - Military and civil aspects; Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985 |SAE SP-633| p 607 A86-38526

**LUBRICATING OILS**
Development of a high temperature jet engine oil - Laboratory and field evaluation
|SAE PAPER 851797| p 607 A86-38527
Performance advantages of high load aviation lubricants
|SAE PAPER 851798| p 607 A86-38528
Some aspects of fluorocarbon elastomer compatibility with gas turbine lubricants
|SAE PAPER 851799| p 601 A86-38529
A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant
|SAE PAPER 851832| p 607 A86-38530
Formulating advanced 4 centistoke gas turbine oils - A feasibility study
|SAE PAPER 851833| p 601 A86-38531
Advanced lubricants for aircraft turbine engines
|SAE PAPER 851834| p 602 A86-38532
Future trends for U.S. Naval aviation propulsion system lubricants
|SAE PAPER 851835| p 608 A86-38533
Electrochemical evaluation of corrosivity in turbine engine oils
|SAE PAPER 851867| p 602 A86-38534
The influence of esters on elastomer seals
|SAE PAPER 851868| p 602 A86-38535
Deposition in gas turbine oil systems. I - Analysis and classification
|SAE PAPER 851869| p 602 A86-38536

**LUBRICATION SYSTEMS**
High-temperature lubrication systems for ring/liner applications in advanced heat engines
|AD-A164955| p 604 N86-26446

## M

**MACH NUMBER**
National transonic facility Mach numer system
p 597 A86-38076
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236

**MAINTAINABILITY**
The design of repairable advanced composite structures
|SAE PAPER 851830| p 606 A86-38335
Design, safety, and maintainability aspects for hydrazine use in emergency secondary power systems
|SAE PAPER 851972| p 568 A86-38382

**MAINTENANCE**
Reliability and maintainability - A look at the Rolls-Royce RB.211
|SAE PAPER 851829| p 590 A86-38334
An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures
|AD-A165586| p 540 N86-26282

**MALFUNCTIONS**
National Transportation Safety Board safety recommendation
|NTSB-4102C/300A| p 571 N86-27267

**MAN MACHINE SYSTEMS**
Putting humans into virtual space --- with visually coupled cockpit simulator p 588 A86-37193
Pilot's Associate - What should it do? --- pilot and airborne computer task allocations
|SAE PAPER 851890| p 539 A86-38356
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations
|AGARD-CP-387| p 573 N86-26316
Some quantitative methodology for cockpit design
p 586 N86-26320

**MANEUVERS**
Aircraft performance optimization with thrust vector control
|AD-A165386| p 587 N86-26334
Bifurcation theory applied to aircraft motions
p 563 N86-27250

**MANUAL CONTROL**
A comparison of voice and keyboard data entry for a helicopter navigation task
|AD-A163245| p 610 N86-26501

**MANUFACTURING**
How US companies are attacking production costs --- of aircraft p 605 A86-37323
Composites: Design and manufacturing for general aviation aircraft; Proceedings of the General Aviation Aircraft Meeting and Exposition, Wichita, KS, April 16-19, 1985
|SAE SP-623| p 582 A86-38515
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 609 A86-38876

**MAPS**
A solid-state map display for rapid response operation
p 589 N86-26323

**MARINE TRANSPORTATION**
Air traffic control (ATC) and vessel traffic systems (VTS) p 572 A86-39558

**MARKOV PROCESSES**
An efficient decision-making-free filter for processes with abrupt changes --- aircraft tracking
|NLR-MP-84080-U| p 618 N86-27018

**MASS FLOW FACTORS**
The external drag of a simple axisymmetric body of revolution in subsonic and supersonic flow with variable mass flowthrough ratios
|AIAA PAPER 86-1828| p 545 A86-37842

**MATERIALS TESTS**
8000 psi hydraulic system seals and materials test program - A progress report
|SAE PAPER 851913| p 580 A86-38367

**MATHEMATICAL MODELS**
Passive control of aerodynamically forced vibrations of supersonic turbomachine rotors by splitter blades
|AIAA PAPER 86-0844| p 590 A86-38892
Proceedings of the Conference on Low Reynolds Number Airfoil Aerodynamics
|NASA-CR-177308| p 540 N86-26283
Integrated risk/cost planning models for the US Air Traffic system
|NASA-CR-177274| p 573 N86-26312
Math model study of a proposed glide slope for runway 13R, Dallas-Fort Worth Airport, Texas
|AD-A164907| p 573 N86-26315
Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241
New rotary rig at RAE and experiments on HIRM
p 562 N86-27243
Recent developments in techniques for dynamic simulation for the identification of stability parameters
p 562 N86-27246
Extraction of aerodynamic parameters for aircraft at extreme flight conditions p 563 N86-27248
Theoretical prediction of wing rocking
p 564 N86-27256
Effects of aerodynamic lags on aircraft responses
p 564 N86-27257
An optimization model for the US Air-Traffic System
|NASA-CR-177277| p 574 N86-27271
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
|AD-A165055| p 599 N86-27294

**MATHEMATICAL PROGRAMMING**
Optimum design of large structures with multiple constraints
|AIAA PAPER 86-0952| p 600 A86-38845

**MATRICES (MATHEMATICS)**
Aeroelastic tailoring of composite wings with external stores
|AIAA PAPER 86-1021| p 609 A86-38878

**MAXIMUM LIKELIHOOD ESTIMATES**
Extraction of aerodynamic parameters for aircraft at extreme flight conditions p 563 N86-27248

**MEASURING INSTRUMENTS**
Calibration of droplet sizing and liquid water content instruments: Survey and analysis
|NASA-CR-175099| p 611 N86-26596
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth
|AD-A164719| p 611 N86-26603

**MECHANICAL DEVICES**
The Shock and Vibration Digest, volume 17, no. 8
|AD-A165115| p 612 N86-27471

**MECHANICAL OSCILLATORS**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
|AD-A163379| p 610 N86-26480

**MECHANICAL PROPERTIES**
Fabrication of ceramic components for advanced gas turbine engines
|SAE PAPER 851786| p 606 A86-38310
Processing study of injection molding of silicon nitride for engine applications
|SAE PAPER 851787| p 606 A86-38311
Strength evaluation of helicopter composite bolted joints
|AIAA PAPER 86-0973| p 608 A86-38853
Impact damage to composite structures
|AGARD-R-729| p 604 N86-27425

**METAL COATINGS**
Process for adhesive bonding of metal skins to aircraft structures
|SAE PAPER 851805| p 606 A86-38321

**METAL FATIGUE**
Fatigue behavior of Ti-6Al-4V powder metallurgy compacts p 603 A86-39617

**METAL HYDRIDES**
Multistage metal hydride compressor
|DE86-001965| p 604 N86-27465

**METAL MATRIX COMPOSITES**
Aeroelastic tailoring of advanced composite compressor blades
|AIAA PAPER 86-1008| p 591 A86-38949

**METAL PLATES**
Effect of crack growth rate variations on life predictions
|AIAA PAPER 86-0981| p 603 A86-38859

**METAL POWDER**
Fatigue behavior of Ti-6Al-4V powder metallurgy compacts p 603 A86-39617

**METALLURGY**
Ingot metallurgy aluminum - Lithium alloys for aircraft structure
|AIAA PAPER 86-0890| p 603 A86-38822

**METEOROLOGICAL FLIGHT**
High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329
Installation of a bleed air heated radome/air motion sensing system on a Beech King Air 200 aircraft
|SAE PAPER 851811| p 589 A86-38322

**METEOROLOGICAL PARAMETERS**
The crash of C-GTLA - The cumulative effects of small defects and a hint of a previously unrecognized major meteorological hazard p 567 A86-37489

**METEOROLOGICAL RADAR**
The FAA/M.I.T. Lincoln Laboratory Doppler Weather Radar program p 614 A86-37461
An aviation composite hazards product --- for meteoroloical radar observations p 566 A86-37469

**METEOROLOGICAL SERVICES**
International Conference on the Aviation Weather System, 2nd, Universite du Quebec, Montreal, Canada, June 19-21, 1985, Preprints p 613 A86-37451
The safety and economic impact of improved aviation weather services p 613 A86-37454
NMC plans for improved aviation guidance --- using numerical weather prediction p 613 A86-37456
The Federal Aviation Administration future aviation weather system p 613 A86-37458
The FAA Automated Weather Observing System (AWOS) p 613 A86-37459
Automation of surface observations program --- for improvement of meteorological services
p 614 A86-37460
The center and central flow weather service unit program p 614 A86-37462
The classify, locate, and avoid wind shear (CLAWS) project at Denver's Stapleton International Airport - Operational testing of terminal weather hazard warnings with an emphasis on microburst wind shear
p 615 A86-37495
Upper air forecasting for aviation in the United States
p 615 A86-37501
The aviation weather forecasting task force - Assessing the current system p 616 A86-37504
The impact of private meteorology on private aviation
p 616 A86-37511

**METEOSAT SATELLITE**
Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation
p 566 A86-37478

**MICROBURSTS**
The classify, locate, and avoid wind shear (CLAWS) project at Denver's Stapleton International Airport - Operational testing of terminal weather hazard warnings with an emphasis on microburst wind shear
p 615 A86-37495
Numerical simulation of precipitation induced downbursts p 615 A86-37496

**MICROCOMPUTERS**
Microcomputers and aviation --- Book
p 567 A86-37625
A minimum route time (MRT) program for microcomputers p 572 A86-39561
A microcomputer pollution model for civilian airports and Air Force bases
|AD-A163232| p 616 N86-26714

**MICROWAVE LANDING SYSTEMS**
MLS - The pilot's point of view p 572 A86-39557
Microwave Landing System (MLS) station interface control report
|DOT/FAA/PM-86/17| p 540 N86-27178
Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project
|AD-A165073| p 575 N86-27273

**MILITARY AIR FACILITIES**
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
|AD-A165055| p 599 N86-27294

**MILITARY AIRCRAFT**
Enhanced mission versatility of the Aquila RPV system
p 575 A86-37338

Boeing Robotic Air Vehicle p 576 A86-37339
A technique to evaluate the accessibility of airborne receivers to interfering signals p 572 A86-37555
X-wing - A low disc-loading V/STOL for the Navy |SAE PAPER 851772| p 578 A86-38307
The significance of advanced technology engines on V/STOL systems |SAE PAPER 851882| p 579 A86-38350
The history and development of the repeatable release catapult holdback bar |SAE PAPER 851942| p 581 A86-38375
Advanced lubricants for aircraft turbine engines |SAE PAPER 851834| p 602 A86-38532
Future trends for U.S. Naval aviation propulsion system lubricants |SAE PAPER 851835| p 608 A86-38533
Electrochemical evaluation of corrosivity in turbine engine oils |SAE PAPER 851867| p 602 A86-38534
Operational experience of U.S. Air Force with structural composites |AIAA PAPER 86-0946| p 583 A86-38840
Fuel conservative guidance for shipboard landing of powered-lift STOL aircraft p 572 A86-39048

**MILITARY HELICOPTERS**
A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant |SAE PAPER 851832| p 607 A86-38530
Future trends for U.S. Naval aviation propulsion system lubricants |SAE PAPER 851835| p 608 A86-38533
Low airspeed envelope determination of the CH-139 Jet Ranger helicopter p 586 A86-39565
A mission navigation and control system for modern military helicopters p 574 N86-26327

**MILITARY OPERATIONS**
The C-17: An attempt at increased airlift versatility |AD-A164822| p 540 N86-26280

**MILITARY TECHNOLOGY**
Flammability of aircraft hydraulic fluids: A bibliography |AD-A165463| p 569 N86-26299

**MISSILE CONFIGURATIONS**
An analysis of elliptic grid generation techniques using an implicit Euler solver |AIAA PAPER 86-1766| p 542 A86-37804

**MIXERS**
Three-dimensional inviscid flow in mixers. I - Mixer analysis using a Cartesian grid p 554 A86-39090

**MODAL RESPONSE**
Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406

**MODELS**
A microcomputer pollution model for civilian airports and Air Force bases |AD-A163232| p 616 N86-26714

**MOLDS**
Generation of an electroformed nickel mold for use in manufacturing composite parts |SAE PAPER 850905| p 607 A86-38523
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing |AIAA PAPER 86-1019| p 609 A86-38876

**MONOPROPELLANTS**
Evaluation of less toxic fuels for aircraft emergency power systems |SAE PAPER 851974| p 601 A86-38384

**MOTION SIMULATORS**
Effects of simulator variations on the fidelity of a UH-60 Black Hawk simulation p 596 A86-37178
Results of piloted simulation of Grumman Design 698 |SAE PAPER 851846| p 579 A86-38342
Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters |UTIAS-307| p 618 N86-27929

**MULTIENGINE VEHICLES**
The STOL performance of a two-engine, USB powered-lift aircraft with cross-shafted fans |SAE PAPER 851839| p 578 A86-38336

**MULTIPHASE FLOW**
Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901

## N

**NAP-OF-THE-EARTH NAVIGATION**
Applications of digital terrain data in flight operations p 573 N86-26324
A new technique for terrain following/terrain avoidance guidance command generation p 574 N86-26325
Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326

**NASTRAN**
KRASH85 user's guide: Input/output format |DOT/FAA/CT-85/10-REV| p 618 N86-27926

**NATIONAL AIRSPACE SYSTEM**
The Federal Aviation Administration future aviation weather system p 613 A86-37458

**NATIONAL PARKS**
Aircraft information packet (Grand Canyon National Park, Arizona) |PB86-159704| p 540 N86-27179

**NATIONAL SEVERE STORMS PROJECT**
Use of computer technology in the operations of the national aviation weather advisory unit p 615 A86-37500

**NAVIER-STOKES EQUATION**
An implicit flux-difference splitting scheme for three-dimensional, incompressible Navier-Stokes solutions to leading edge vortex flows |AIAA PAPER 86-1839| p 546 A86-37847
Reduced Navier-Stokes (RNS relaxation procedure for internal flows with interaction) |SAE PAPER 851790| p 547 A86-38314
Navier-Stokes computations of lee-side flows over delta wings |AIAA PAPER 86-1049| p 548 A86-38420
Progress in the development of parabolized Navier-Stokes (PNS) methodology for analyzing propulsive jet mixing problems |AIAA PAPER 86-1115| p 551 A86-38473
Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme |NAL-TR-889T| p 555 N86-27184
Viscous vortical flow calculations over delta wings p 558 N86-27202
Computation of leading-edge vortex flows p 558 N86-27205
Steady supersonic Navier-Stokes solutions of a 75 deg delta wing p 558 N86-27206
Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil p 560 N86-27228

**NAVIGATION AIDS**
A comparison of voice and keyboard data entry for a helicopter navigation task |AD-A163245| p 610 N86-26501

**NAVIGATION INSTRUMENTS**
Flight test with a terrain aided navigation system p 571 A86-37334

**NEAR WAKES**
Flow structure of lateral wing-tip blowing |AIAA PAPER 86-1810| p 544 A86-37831

**NETWORK ANALYSIS**
Integrated risk/cost planning models for the US Air Traffic system |NASA-CR-177274| p 573 N86-26312

**NETWORK SYNTHESIS**
Multi-input multi-output automatic design synthesis for performance and robustness p 618 A86-39034

**NICKEL**
Generation of an electroformed nickel mold for use in manufacturing composite parts |SAE PAPER 850905| p 607 A86-38523

**NIGHT FLIGHTS (AIRCRAFT)**
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations |AGARD-CP-387| p 573 N86-26316
The wide field helmet mounted display p 589 N86-26322
Night vision by NVG with FLIR p 619 N86-26811

**NIGHT VISION**
FLIR, NVG and HMS/D systems for helicopter operation: Review p 619 N86-26804
Night vision by NVG with FLIR p 619 N86-26811

**NOISE INTENSITY**
Advisory Circular: Estimated airplane noise levels in A-weighted decibels |AC-36-3D| p 620 N86-27969

**NOISE MEASUREMENT**
Analysis of helicopter noise data using international helicopter noise certification procedures |PB86-186533| p 620 N86-27972

**NOISE PREDICTION (AIRCRAFT)**
Wave envelope and finite element approximations for turbofan noise radiation in flight p 619 A86-39057
Helicopter noise p 560 N86-27223

**NOISE REDUCTION**
Noise transmission into propeller aircraft p 619 N86-27473

**NOISE SPECTRA**
Effects of cone surface waviness and freestream noise on transition in supersonic flow |AIAA PAPER 86-1086| p 550 A86-38448
Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios |NASA-TM-88766| p 620 N86-27970

**NONDESTRUCTIVE TESTS**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies |AD-A163379| p 610 N86-26480
Use of NDE to evaluate reflection cracking in airfield pavements |AD-A164880| p 599 N86-27293
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements |AD-A165055| p 599 N86-27294

**NONFLAMMABLE MATERIALS**
Nonflammable fluid and 8,000 psi technology for future aircraft hydraulic systems (22 CFR 125.4 /b/ /13/ applicable) |SAE PAPER 851909| p 580 A86-38364
Hydraulic pumps for high pressure non-flammable fluids --- for aircraft |SAE PAPER 851911| p 580 A86-38366

**NONISENTROPICITY**
Nonisentropic unsteady three dimensional small disturbance potential theory |AIAA PAPER 86-0863| p 552 A86-38898

**NONLINEAR SYSTEMS**
Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395
Effects of structural nonlinearities on limit cycle response of aerodynamic surfaces |AIAA PAPER 86-0899| p 585 A86-38910
Application of CFD techniques toward the validation of nonlinear aerodynamic models p 565 N86-27265
KRASH85 user's guide: Input/output format |DOT/FAA/CT-85/10-REV| p 618 N86-27926

**NONLINEARITY**
Nonlinear problems in flight dynamics involving aerodynamic bifurcations p 563 N86-27249
Bifurcation theory applied to aircraft motions p 563 N86-27250
A self-organising control system for non-linear aircraft dynamics p 564 N86-27258
Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266
An optimization model for the US Air-Traffic System |NASA-CR-177277| p 574 N86-27271

**NONPARAMETRIC STATISTICS**
Aircraft nuclear survivability methods |AD-A163218| p 587 N86-26332

**NONSTABILIZED OSCILLATION**
Nonlinear problems in flight dynamics involving aerodynamic bifurcations p 563 N86-27249

**NONUNIFORM FLOW**
Heat transfer and drag of a body in the far supersonic wake p 554 A86-39657
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes |AD-A164629| p 555 N86-26291

**NORTH AMERICA**
A cold-season North American climatology of strong vertical wind shear p 614 A86-37466

**NOSE WHEELS**
The generation of tire cornering forces in aircraft with a free-swiveling nose gear |SAE PAPER 851939| p 581 A86-38372

**NOWCASTING**
Wide area real-time thunderstorm mapping using LPATS - The lightning position and tracking system p 614 A86-37487

**NUCLEAR EXPLOSION EFFECT**
Aircraft nuclear survivability methods |AD-A163218| p 587 N86-26332

**NUMERICAL ANALYSIS**
Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations |NASA-TM-87727| p 559 N86-27209
Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios |NASA-TM-88766| p 620 N86-27970

**NUMERICAL CONTROL**
Use of the flight simulator in performing AFTI/F-16 airplane aeroservoelastic analysis |AIAA PAPER 86-0957| p 585 A86-38931

**NUMERICAL FLOW VISUALIZATION**
Numerical simulation of precipitation induced downbursts p 615 A86-37498
Inviscid and viscous simulations of high angle of attack flows |SAE PAPER 851820| p 548 A86-38328
Numerical simulation of tip vortices of wings in subsonic and transonic flows |AIAA PAPER 86-1095| p 550 A86-38456

**NUMERICAL WEATHER FORECASTING**
NMC plans for improved aviation guidance --- using numerical weather prediction p 613 A86-37456
Evaluating the new automated weather observing system p 615 A86-37491

Development of CAT detection and forecasting techniques for the profs central weather processor
p 615 A86-37498
Upper air forecasting for aviation in the United States
p 615 A86-37501

O

**OBLIQUE WINGS**
Decoupling control synthesis for an oblique-wing aircraft
[NASA-TM-86801] p 595 N86-26339
Aeroelastic control of oblique-wing aircraft
[NASA-TM-86808] p 595 N86-26340
**OILS**
Flammability of aircraft hydraulic fluids: A bibliography
[AD-A165463] p 569 N86-26299
Properties of aircraft fuels and related materials
[AD-A164532] p 604 N86-27461
**OMEGA NAVIGATION SYSTEM**
Experimental and theoretical study of the effect of wave propagation on the postitional accuracy of Omega navigation in Germany --- German thesis
p 572 A86-38974
**ONBOARD EQUIPMENT**
NASA experiments onboard the controlled impact demonstration
[SAE PAPER 851885] p 568 A86-38352
Characteristics of synthetic aperture radars
p 610 A86-39683
**OPTICAL COUNTERMEASURES**
Aerospace knowledge magazine (selected articles)
[AD-A164720] p 539 N86-26278
**OPTICAL MEASURING INSTRUMENTS**
FLIR, NVG and HMS/D systems for helicopter operation: Review p 619 N86-26804
**OPTICAL RADAR**
Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326
Airborne lidar measurements of El Chichon stratoshperic aerosols
[NASA-RP-1166] p 616 N86-27835
**OPTICS**
Thermal zoom optics for R.P.V. sensors
p 588 A86-37341
**OPTIMIZATION**
An optimization model for the US Air-Traffic System
[NASA-CR-177277] p 574 N86-27271
Structural tailoring of engine blades (STAEBL) theoretical manual
[NASA-CR-175112] p 592 N86-27283
Structural tailoring of engine blades (STAEBL) user's manual
[NASA-CR-175113] p 592 N86-27284
**ORGANIC PHOSPHORUS COMPOUNDS**
Environmental and adhesive durability of aluminium-polymer systems protected with organic corrosion inhibitors p 601 A86-37708
**OSCILLATIONS**
Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations: Dynamic stall
p 561 N86-27231
Computational aspects of unsteady flows
p 561 N86-27232
Unsteady airload computations for airfoil oscillating in attached and separated compressible flow
p 561 N86-27238
**OUTLETS**
Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine
p 591 A86-38998

P

**P-3 AIRCRAFT**
Engineering applications of an advanced low-order panel method
[SAE PAPER 851793] p 547 A86-38316
**PANEL FLUTTER**
Frequency domain synthesis of a robust flutter suppression control law p 594 A86-39042
**PANEL METHOD (FLUID DYNAMICS)**
Aerodynamics and radar-signature - A theoretical approach to estimate the radar-signature of complex aircraft configurations compatible with aerodynamic panel-methods
[AIAA PAPER 86-1770] p 577 A86-37807
Unsteady forces on counter-rotating propeller blades
[AIAA PAPER 86-1804] p 590 A86-37827
PAN AIR analysis of a transport high-lift configuration
[AIAA PAPER 86-1811] p 544 A86-37832
The use of curved higher order panels for vortex sheet modeling
[AIAA PAPER 86-1812] p 544 A86-37833
A high order supersonic triplet singularity
[AIAA PAPER 86-1815] p 545 A86-37834
Engineering applications of an advanced low-order panel method
[SAE PAPER 851793] p 547 A86-38316
The indirect boundary integral formulation for elliptic, hyperbolic and non-linear fluid flows
p 553 A86-38971
**PANELS**
Buckling and final failure of graphite/PEEK stiffener sections
[AIAA PAPER 86-0921] p 608 A86-38831
The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression --- semisubmersible platform
[NLR-MP-85019-U] p 611 N86-26661
**PARAMETER IDENTIFICATION**
Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406
Recurrent identification of unsteady aerodynamic forces of elastic vehicles p 554 A86-39762
Six-force-factor identification of helicopters
p 586 A86-39763
Recent developments in techniques for dynamic simulation for the identification of stability parameters
p 562 N86-27246
**PARTICLE SIZE DISTRIBUTION**
Particulate contaminant relocation during shuttle ascent
[NASA-TM-87794] p 600 N86-27351
**PARTICULATE SAMPLING**
Particulate contaminant relocation during shuttle ascent
[NASA-TM-87794] p 600 N86-27351
**PASSENGER AIRCRAFT**
Further results of natural laminar flow flight test experiments
[SAE PAPER 850862] p 581 A86-38504
Analytical study of three-surface lifting systems
[SAE PAPER 850866] p 552 A86-38507
Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet
[NASA-CR-178097] p 587 N86-27278
**PASSENGERS**
Gust alleviation on a transport airplane
p 565 N86-27259
**PATTERN METHOD (FORECASTING)**
A unified procedure for meeting power-spectral-density and statistical-discrete-gust requirements for flight in turbulence
[AIAA PAPER 86-1011] p 584 A86-38869
**PAVEMENTS**
Comparative study of nondestructive pavement testin WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
[AD-A163379] p 610 N86-26480
Use of NDE to evaluate reflection cracking in airfield pavements
[AD-A164880] p 599 N86-27293
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
[AD-A165055] p 599 N86-27294
**PERFORATED PLATES**
The dynamic instability of plate structures
p 605 A86-37348
**PERFORMANCE PREDICTION**
A verification of propulsion and airplane performance models generated from flight
[SAE PAPER 851899] p 580 A86-38362
A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application
p 591 A86-38994
New rotary rig at RAE and experiments on HIRM
p 562 N86-27243
Correlation of predicted and free-flight responses near departure conditions of a high incidence research model
p 564 N86-27255
Theoretical prediction of wing rocking
p 564 N86-27256
**PERFORMANCE TESTS**
Full-scale tilt-rotor hover performance
p 576 A86-37770
Aviation gas turbine lubricants Military and civil aspects: Aviation fuel and lubricants - Performance testing; Proceedings of the Aerospace Technology Conference and Exposition, Long Beach, CA, October 14-17, 1985
[SAE SP-633] p 607 A86-38526
Performance advantages of high load aviation lubricants
[SAE PAPER 851798] p 607 A86-38528
The influence of JFTOT operating parameters on the assessment of fuel thermal stability --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851871] p 602 A86-38538
**PERSONNEL**
The risk to third party personnel from RPV operations
p 566 A86-37327
A comparison of voice and keyboard data entry for a helicopter navigation task
[AD-A163245] p 610 N86-26501
**PILOT ERROR**
National Transportation Safety Board safety recommendation
[NTSB-4102C/300A] p 571 N86-27267
**PILOT PERFORMANCE**
CGI delay compensation --- Computer Generated Image p 617 A86-37194
Wind shear studies and cockpit integration
[SAE PAPER 851812] p 593 A86-38323
Pilot's Associate - What should it do? --- pilot and airborne computer task allocations
[SAE PAPER 851890] p 539 A86-38356
Some quantitative methodology for cockpit design
p 586 N86-26320
Validation of a new flying quality criterion for the landing task
[NASA-TM-88261] p 595 N86-26341
**PILOT TRAINING**
Alpha Jet Training System single aircraft concept
[SAE PAPER 851766] p 598 A86-38301
USAF Test Pilot School use of DIGITAC in systems testing
[SAE PAPER 851827] p 594 A86-38333
**PILOTLESS AIRCRAFT**
Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings and Supplementary Papers p 575 A86-37326
The development of Z-2 Remotely Piloted Helicopter
p 575 A86-37328
High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329
P T A - Design considerations for an airframe system and detailed design of fuel subsystem --- Pilotless Target Aircraft p 590 A86-37331
**PISTONS**
High-temperature lubrication systems for ring/liner applications in advanced heat engines
[AD-A164955] p 604 N86-26446
**PITCH (INCLINATION)**
Three-dimensional unsteady flow fields elicited by a pitching forward swept wing
[AIAA PAPER 86-1104] p 551 A86-38464
Unsteady aerodynamics of rapidly pitched airfoils
[AIAA PAPER 86-1105] p 551 A86-38465
Experimental aeroelastic behavior of forward swept graphite/epoxy wings with rigid body freedoms
[AIAA PAPER 86-0971] p 584 A86-38851
Unsteady vortical flow around three-dimensional lifting surfaces p 553 A86-39052
**PITOT TUBES**
Method for determining the time delay of the pitot-static tubing system of aircraft --- semisubmersible platform
[NLR-TR-83075-U] p 589 N86-26335
**PIVOTS**
Pivotable strakes for high angle of attack control
[SAE PAPER 851821] p 593 A86-38329
**PLASTIC AIRCRAFT STRUCTURES**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
[AD-A165289] p 603 N86-26384
**PLATE THEORY**
Equivalent plate analysis of aircraft wing box structures with general planform geometry
[AIAA PAPER 86-0940] p 583 A86-38837
Strength evaluation of helicopter composite bolted joints
[AIAA PAPER 86-0973] p 608 A86-38853
**PLATES (STRUCTURAL MEMBERS)**
Optimized bolted joint
[NASA-CASE-LAR-13250-1] p 612 N86-27630
**PLUMES**
Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation
p 566 A86-37478
Plume characteristics of single-stream and duel-flow conventional and inverted-profile nozzles at equal thrust
[NASA-TM-87323] p 554 N86-26285
**PLY ORIENTATION**
Aeroelastic tailoring of advanced composite compressor blades
[AIAA PAPER 86-1008] p 591 A86-38949
**POLLUTION**
A microcomputer pollution model for civilian airports and Air Force bases
[AD-A163232] p 616 N86-26714
**POROUS WALLS**
Surge margin enhancement by a porous throat diffuser p 592 A86-39568

**POSITION (LOCATION)**
An analysis of S-3 SDLM (Standard Depot Level Maintenance) corrosion documentation procedures
[AD-A165588] p 540 N86-26282
**POSITION ERRORS**
An terrain-aided guidance system with high convergence speed p 573 A86-39766
**POSITIVE FEEDBACK**
Design of a flutter mode controller using positive real feedback p 594 A86-39041
**POTENTIAL FLOW**
Transonic potential flow calculations by two artificial density methods
[AIAA PAPER 86-1084] p 549 A86-38446
Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence --- graph theory
[NLR-MP-84040-U] p 555 N86-26293
**POTENTIAL THEORY**
Nonisentropic unsteady three dimensional small disturbance potential theory
[AIAA PAPER 86-0863] p 552 A86-38898
**POWDER METALLURGY**
Fabrication of ceramic components for advanced gas turbine engines
[SAE PAPER 851786] p 606 A86-38310
Fatigue behavior of Ti-6Al-4V powder metallurgy compacts p 603 A86-39617
**POWER SERIES**
Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395
**POWER SPECTRA**
A unified procedure for meeting power-spectral-density and statistical-discrete-gust requirements for flight in turbulence
[AIAA PAPER 86-1011] p 584 A86-38869
**POWERED LIFT AIRCRAFT**
The STOL performance of a two-engine, USB powered-lift aircraft with cross-shafted fans
[SAE PAPER 851839] p 578 A86-38336
Fuel conservative guidance for shipboard landing of powered-lift STOL aircraft p 572 A86-39048
**PRECIPITATION (METEOROLOGY)**
Numerical simulation of precipitation induced downbursts p 615 A86-37496
**PREDICTION ANALYSIS TECHNIQUES**
Durability prediction of parallel fuel tank skins with fluid-structure interaction dynamics
[AIAA PAPER 86-0935] p 591 A86-38927
Recent developments in techniques for dynamic simulation for the identification of stability parameters
p 562 N86-27246
The Shock and Vibration Digest, volume 17, no. 8
[AD-A165115] p 612 N86-27471
**PREPREGS**
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
[AIAA PAPER 86-1019] p 609 A86-38876
**PRESSURE DISTRIBUTION**
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
A study of cracking in the pressure bulkhead of a military transport aircraft
[AIAA PAPER 86-0983] p 584 A86-38861
Aerodynamic characteristics of an oscillating airfoil --- for Vertical Axis Wind Turbine p 616 A86-39566
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
[AD-A164629] p 555 N86-26291
**PRESSURE MEASUREMENT**
National transonic facility Mach numer system
p 597 A86-38076
Design, development and operation of a high simultaneous capacity digital telemetry system
p 613 N86-27632
**PRESSURE OSCILLATIONS**
Identification of longitudinal acoustic modes associated with pressure oscillations in ramjets p 591 A86-39079
Dynamic stall of swept and unswept oscillating wings
p 560 N86-27226
**PRESSURE REDUCTION**
A hot air tunnel for base bleed experimentation
p 597 A86-38252
**PROJECTILES**
A hot air tunnel for base bleed experimentation
p 597 A86-38252
**PROP-FAN TECHNOLOGY**
Large-Scale Advanced Prop-Fan (LAP) pitch change actuator and control design report
[NASA-CR-174788] p 592 N86-27282
Noise transmission into propeller aircraft
p 619 N86-27473
**PROPAGATION VELOCITY**
Effect of crack growth rate variations on life predictions
[AIAA PAPER 86-0981] p 603 A86-38859
**PROPELLER BLADES**
Unsteady forces on counter-rotating propeller blades
[AIAA PAPER 86-1804] p 590 A86-37827
Preliminary results of unsteady blade surface pressure measurements for the SR-3 propeller
[NASA-TM-87352] p 559 N86-27213
Noise transmission into propeller aircraft
p 619 N86-27473
**PROPELLER SLIPSTREAMS**
An investigation of the effects of the propeller slipstream of a laminar wing boundary layer
[SAE PAPER 850859] p 551 A86-38502
**PROPELLERS**
Aerodynamic effects of wingtip-mounted propellers and turbines
[AIAA PAPER 86-1802] p 544 A86-37826
The Shock and Vibration Digest, volume 17, no. 8
[AD-A165115] p 612 N86-27471
**PROPULSION SYSTEM PERFORMANCE**
Summary of results of NASA F-15 flight research program
[NASA-TM-86811] p 539 N86-26277
Air Force Academy Aeronautics Digest
[AD-A164940] p 540 N86-26281
**PROTECTION**
Lightning discharge protection rod
[NASA-CASE-LAR-13470-1] p 569 N86-26296
**PROTECTIVE COATINGS**
Environmental and adhesive durability of aluminum-polymer systems protected with organic corrosion inhibitors p 601 A86-37708
**PULSED LASERS**
Pulsed laser light sheet flow visualization
p 605 A86-38237
**PUMPS**
Hydraulic pumps for high pressure non-flammable fluids --- for aircraft
[SAE PAPER 851911] p 580 A86-38366

**Q**

**QUADRATIC EQUATIONS**
Aeroelastic control of oblique-wing aircraft
[NASA-TM-86808] p 595 N86-26340

**R**

**RADAR ANTENNAS**
Characteristics of synthetic aperture radars
p 610 A86-39683
**RADAR DATA**
Radar data processing. Volume 2 - Advanced topics and applications --- Book p 605 A86-38224
**RADAR MAPS**
Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326
**RADAR RESOLUTION**
Characteristics of synthetic aperture radars
p 610 A86-39683
**RADAR SIGNATURES**
Aerodynamics and radar-signature - A theoretical approach to estimate the radar-signature of complex aircraft configurations compatible with aerodynamic panel-methods
[AIAA PAPER 86-1770] p 577 A86-37807
**RADAR TRACKING**
An efficient decision-making-free filter for processes with abrupt changes --- aircraft tracking
[NLR-MP-84080-U] p 618 N86-27018
**RADIATION DETECTORS**
FLIR, NVG and HMS/D systems for helicopter operation: Review p 619 N86-26804
**RADIO RELAY SYSTEMS**
Research on the technology of an airplane concept for a Stationary High-Altitude Relay Platform (SHARP)
p 586 A86-39564
**RADIO TELEMETRY**
Design, development and operation of a high simultaneous capacity digital telemetry system
p 613 N86-27632
**RADIOACTIVE ISOTOPES**
Surface layer activation technique for monitoring and in situ wear mearurement of turbine components
p 591 A86-39086
**RADOMES**
Installation of a bleed air heated radome/air motion sensing system on a Beech King Air 200 aircraft
[SAE PAPER 851811] p 589 A86-38322
**RAIN**
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth
[AD-A164719] p 611 N86-26803
**RAMJET ENGINES**
Identification of longitudinal acoustic modes associated with pressure oscillations in ramjets p 591 A86-39079
**RANDOM VIBRATION**
Stochastic flutter of nonlinear aeroelastic structures with parameter random fluctuations
[AIAA PAPER 86-0962] p 609 A86-38934
**RAYLEIGH-RITZ METHOD**
Aeroelastic tailoring of advanced composite compressor blades
[AIAA PAPER 86-1006] p 591 A86-38949
**REACTION CONTROL**
A method for estimating jet reaction control effectiveness
[AIAA PAPER 86-1805] p 593 A86-37828
**REAL TIME OPERATION**
Techniques for optimizing computer performance in real-time flight simulation p 617 A86-37177
Real-time simulator for helicopter rotor wind-tunnel operations p 596 A86-37179
Simulation support software in a real-time environment at the U.S. Air Force Flight Test Center
p 617 A86-37180
Flexible manufacturing system for the fabrication of precision components with real time simulation
[SAE PAPER 851804] p 606 A86-38320
Synthetic real-time relief display all-weather airborne missions p 589 N86-26321
Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters
[UTIAS-307] p 618 N86-27929
A high-order language dor a system of closely coupled processing elements
[NASA-CR-177280] p 619 N86-27930
**RECOMMENDATIONS**
Transportation safety recommendations adopted during the month of December 1985
[PB85-916[illegible]12] p 569 N86-26301
**RECONNAISSANCE AIRCRAFT**
Thermal zoom optics for R.P.V. sensors
p 588 A86-37341
The Phoenix sensor turret system
p 588 A86-37342
**RECOVERY**
The Phoenix air vehicle, its launch and recovery
p 576 A86-37340
**RECTANGULAR PANELS**
Effects of nonlinear damping on random response of beams to acoustic loading
[AIAA PAPER 86-1004] p 609 A86-38945
**RECTANGULAR PLANFORMS**
Divergence study of a high-aspect ratio, forward-swept wing
[NASA-TM-87682] p 586 N86-27279
**RECTANGULAR WINGS**
Flow structure of lateral wing-tip blowing
[AIAA PAPER 86-1810] p 544 A86-37831
Transonic aeroelasticity of wings with tip stores
[AIAA PAPER 86-1007] p 553 A86-38948
Unsteady vortical flow around three-dimensional lifting surfaces p 553 A86-39052
**REDUCED ORDER FILTERS**
Aeroelastic control of oblique-wing aircraft
[NASA-TM-86808] p 595 N86-26340
**REDUNDANCY**
Application of analytical redundancy --- for flight safety
[SAE PAPER 851825] p 593 A86-38331
**REENTRY VEHICLES**
Engineering applications of an advanced low-order panel method
[SAE PAPER 851793] p 547 A86-38316
**REFLECTION**
Use of NDE to evaluate reflection cracking in airfield pavements
[AD-A164880] p 599 N86-27293
**REFRIGERATING MACHINERY**
Oxygen chemisorption cryogenic refrigerator
[NASA-CASE-NPO-16734-1-CU] p 612 N86-27467
**REGRESSION ANALYSIS**
Analysis of helicopter noise data using international helicopter noise certification procedures
[PB86-186533] p 620 N86-27972
**REGULATIONS**
Advisory Circular: Estimated airplane noise levels in A-weighted decibels
[AC-36-3D] p 620 N86-27969
**RELIABILITY ENGINEERING**
Reliability and maintainability - A look at the Rolls-Royce RB.211
[SAE PAPER 851829] p 590 A86-38334

**RELIEF MAPS**
Synthetic real-time relief display all-weather airborne missions p 589 N86-26321
Applications of digital terrain data in flight operations p 573 N86-26324
Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326

**REMOTE CONTROL**
Ground control station for RPVs p 571 A86-37336

**REMOTE SENSORS**
The Phoenix sensor turret system p 588 A86-37342
Applications of sensor payloads p 588 A86-37343

Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings and Supplementary Papers p 575 A86-37326
The risk to third party personnel from RPV operations p 586 A86-37327
The development of Z-2 Remotely Piloted Helicopter p 575 A86-37328
High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329
Canadair rotary wing, full scale engineering development. III p 575 A86-37330
A thermal imaging payload for RPV applications p 588 A86-37333
Flight test with a terrain aided navigation system p 571 A86-37334
A real-time simulation of a non-linear RPV incorporating head-up type colour graphics p 593 A86-37335
Ground control station for RPVs p 571 A86-37336
A new compressed air launching system p 586 A86-37337
Enhanced mission versatility of the Aquila RPV system p 575 A86-37338
Boeing Robotic Air Vehicle p 576 A86-37339
The Phoenix air vehicle, its launch and recovery p 576 A86-37340
Thermal zoom optics for R.P.V. sensors p 588 A86-37341
The Phoenix sensor turret system p 588 A86-37342
Applications of sensor payloads p 588 A86-37343
'A flywheel powered RPV launcher - Putting theory into practice' p 590 A86-37344
A spring in the air --- launching device for RPV p 590 A86-37345
Design features of automatic control system of D-4 RPV p 593 A86-37407
NASA experiments onboard the controlled impact demonstration
|SAE PAPER 851885| p 568 A86-38352

**RENE 41**
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|AIAA PAPER 86-0978| p 609 A86-38857
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|NASA-TM-86798| p 611 N86-26653

**REPORTS**
Aircraft accident reports: Brief format, US civil and foreign aviation, issue number 17 of 1983 accidents
|PB85-916918| p 571 N86-27269

**RESEARCH AIRCRAFT**
The presence of the Trident III on Antarctica p 573 A86-39562
Summary of results of NASA F-15 flight research program
|NASA-TM-86811| p 539 N86-26277
X-29A technology demonstrator flight test program overview
|NASA-TM-86800| p 586 N86-26328

**RESEARCH AND DEVELOPMENT**
Folding tiltrotor technology demonstrator - The next step for tiltrotor technology
|SAE PAPER 851844| p 579 A86-38341
Next generation aircraft structures - The need for co-ordinated Canadian R & D programs p 539 A86-39567
Investigations in the history and theory of the development of aviation and space science and technology. Number 4 --- Russian book p 620 A86-39984

**RESONANT FREQUENCIES**
Analysis of direct and nearby lightning strike data for aircraft
|NASA-CR-172127| p 617 N86-27855

**RETROFITTING**
Retrofitting avionics - Closing the performance 'Generation gap'
|SAE PAPER 851813| p 589 A86-38324

**REUSABLE HEAT SHIELDING**
Users guide: Steady-state aerodynamic-loads program for shuttle TPS tiles
|NASA-TM-85724| p 600 N86-27406

**REYNOLDS NUMBER**
Laminar boundary layer stability experiments on a cone at Mach 8. IV - On unit Reynolds number and environmental effects
|AIAA PAPER 86-1087| p 550 A86-38449
La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984
|ESA-TT-907| p 559 N86-27217

**RIDING QUALITY**
Study on using a digital ride quality augmentation system to trim an engine-out in a Cessna 402B
|NASA-CR-177272| p 595 N86-26342
Gust alleviation on a transport airplane p 565 N86-27259

**RIGID ROTORS**
Gust response of hingeless rotors p 576 A86-37772

**RIGID WINGS**
Experimental aeroelastic behavior of forward swept graphite/epoxy wings with rigid body freedoms
|AIAA PAPER 86-0971| p 584 A86-38851

**RING STRUCTURES**
Flight effects on noise from coaxial dual flow. I - Unheated jets p 619 A86-39058

**RISK**
Integrated risk/cost planning models for the US Air Traffic system
|NASA-CR-177274| p 573 N86-26312

**RIVETED JOINTS**
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform
|NLR-TR-84051-U| p 611 N86-26662

**ROBUSTNESS (MATHEMATICS)**
Multi-input multi-output automatic design synthesis for performance and robustness p 618 A86-39034

**ROCKET LAUNCHERS**
Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet
|NASA-CR-178097| p 587 N86-27278

**RODS**
Lightning discharge protection rod
|NASA-CASE-LAR-13470-1| p 569 N86-26296

**ROTARY STABILITY**
Recent developments in rotary-balance testing of fighter aircraft configurations at NASA Ames Research Center p 562 N86-27242

**ROTARY WING AIRCRAFT**
Canadair rotary wing, full scale engineering development. III p 575 A86-37330
Review of dynamic inflow modeling for rotorcraft flight dynamics
|AIAA PAPER 86-0845| p 584 A86-38893
KRASH85 user's guide: Input/output format
|DOT/FAA/CT-85/10-REV| p 618 N86-27926

**ROTARY WINGS**
Real-time simulator for helicopter rotor wind-tunnel operations p 596 A86-37179
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
Full-scale tilt-rotor hover performance p 576 A86-37770
Gust response of hingeless rotors p 576 A86-37772
A unified formulation of rotor load prediction methods p 576 A86-37774
Wind tunnel test of a model rotor with a free-tip
|AIAA PAPER 86-1781| p 577 A86-37813
Euler solutions for the flow around a hovering helicopter rotor
|AIAA PAPER 86-1784| p 543 A86-37815
Euler calculations for flowfield of a helicopter rotor in hover
|AIAA PAPER 86-1782| p 577 A86-37849
Unsteady aerodynamics of rapidly pitched airfoils
|AIAA PAPER 86-1105| p 551 A86-38465
Computation of transonic flow about helicopter rotor blades p 554 A86-39053
Six degree-of-freedom LIVE isolation systems, part 1
|NASA-CR-177928| p 587 N86-26331
La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984
|ESA-TT-907| p 559 N86-27217
A vortex point method for calculating inviscid incompressible flows around rotary wings p 612 N86-27219
Dynamic stall modeling of the NACA 0012 profile p 559 N86-27222

**ROTATING BODIES**
New rotary rig at RAE and experiments on HIRM p 562 N86-27243

**ROTOR AERODYNAMICS**
Effectiveness of current dynamic-inflow models in hover and forward flight p 576 A86-37773
A unified formulation of rotor load prediction methods p 576 A86-37774
Wind tunnel test of a model rotor with a free-tip
|AIAA PAPER 86-1781| p 577 A86-37813
Euler solutions for the flow around a hovering helicopter rotor
|AIAA PAPER 86-1784| p 543 A86-37815
Review of dynamic inflow modeling for rotorcraft flight dynamics
|AIAA PAPER 86-0845| p 584 A86-38893
Recent developments in the dynamics of advanced rotor systems. I p 586 A86-39597
Dynamic stall modeling of the NACA 0012 profile p 559 N86-27222

**ROTOR BLADES**
A unified formulation of rotor load prediction methods p 576 A86-37774

**ROTOR BLADES (TURBOMACHINERY)**
Passive control of aerodynamically forced vibrations of supersonic turbomachine rotors by splitter blades
|AIAA PAPER 86-0844| p 590 A86-38892
Computation of transonic flow about helicopter rotor blades p 554 A86-39053
Dynamic stall of swept and unswept oscillating wings p 560 N86-27226
A critical look at dynamic simulation of viscous flow p 560 N86-27230

**ROTORCRAFT AIRCRAFT**
Experimental investigation of rotorcraft hub and shaft fairing drag reduction
|AIAA PAPER 86-1783| p 577 A86-37814

**ROTORS**
Linear dynamic coupling in geared rotor systems
|ASME PAPER 85-DET-11| p 608 A86-38617
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
|AD-A164629| p 555 N86-26291
The Shock and Vibration Digest, volume 18, no. 1
|AD-A165726| p 612 N86-27468

**RUNGE-KUTTA METHOD**
An Euler aerodynamic method for leading-edge vortex flow simulation p 558 N86-27203

**RUNWAY CONDITIONS**
Generic aircraft ground operation simulation
|AIAA PAPER 86-0989| p 584 A86-38865

**RUNWAYS**
Aircraft flotation analysis - Current methods and perspective --- of ground performance evaluation
|SAE PAPER 851936| p 580 A86-38369
Math model study of a proposed glide slope for runway 13R, Dallas-Fort Worth Airport, Texas
|AD-A164907| p 573 N86-26315
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
|AD-A163379| p 610 N86-26480
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth
|AD-A164719| p 611 N86-26603
Use of NDE to evaluate reflection cracking in airfield pavements
|AD-A164880| p 599 N86-27293
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
|AD-A165055| p 599 N86-27294

## S

**S WAVES**
Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios
|NASA-TM-88766| p 620 N86-27970

**SAFETY DEVICES**
Upper torso restraint systems --- for fixed wing and rotorcraft aircraft
|SAE PAPER 851848| p 567 A86-38344

**SAFETY MANAGEMENT**
Transportation safety recommendations adopted during the month of December 1985
|PB85-916612| p 569 N86-26301

**SAMPLING**
Airborne lidar measurements of El Chichon stratoshperic aerosols
|NASA-RP-1166| p 616 N86-27835

**SATELLITE OBSERVATION**
Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation p 566 A86-37478

**SEALS (STOPPERS)**
8000 psi hydraulic system seals and materials test program - A progress report
|SAE PAPER 851913| p 580 A86-38367
The influence of esters on elastomer seals
|SAE PAPER 851868| p 602 A86-38535

**SEAT BELTS**
Upper torso restraint systems --- for fixed wing and rotorcraft aircraft
|SAE PAPER 851848| p 567 A86-38344
Data for the development of criteria for general aviation seat and restraint system performance
|SAE PAPER 850851| p 568 A86-38511
**SEATS**
Data for the development of criteria for general aviation seat and restraint system performance
|SAE PAPER 850851| p 568 A86-38511
A procedure to evaluate aircraft crash floor pulses
|SAE PAPER 850854| p 582 A86-38513
Preliminary design research for the Caravan 1 crew seat
|SAE PAPER 850856| p 582 A86-38514
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298
**SEPARATED FLOW**
Calculation of asymmetric vortex separation on slender delta wings with a vortex-sheet model
|AIAA PAPER 86-1836| p 546 A86-37846
Navier-Stokes computations of lee-side flows over delta wings
|AIAA PAPER 86-1049| p 548 A86-38420
Experimental determination of the laminar separation bubble characteristics on an airfoil at low Reynolds numbers
|AIAA PAPER 86-1065| p 548 A86-38433
Analysis of transitional separation bubbles on infinite swept wings
|NASA-CR-3956| p 555 N86-26288
Computation of leading-edge vortex flows
p 558 N86-27205
A self-organising control system for non-linear aircraft dynamics p 564 N86-27258
**SEPARATORS**
Development of the portable water separometer for the WSIM test
|SAE PAPER 851870| p 608 A86-38537
**SHAFTS (MACHINE ELEMENTS)**
Experimental investigation of rotorcraft hub and shaft fairing drag reduction
|AIAA PAPER 86-1783| p 577 A86-37814
**SHARP LEADING EDGES**
A comparison of experimental and numerical results for delta wings with vortex flaps
|AIAA PAPER 86-1840| p 546 A86-37848
Influence of numerical dissipation in computing supersonic vortex-dominated flows
|AIAA PAPER 86-1073| p 549 A86-38439
**SHIPS**
Preliminary evaluation of a compound cycle engine for shipboard gensets
|NASA-CR-179451| p 611 N86-26629
**SHOCK LOADS**
The Shock and Vibration Digest, volume 18, no. 1
|AD-A165726| p 612 N86-27468
The Shock and Vibration Digest, volume 17, no. 8
|AD-A165115| p 612 N86-27471
**SHOCK TUNNELS**
Wall cooling effects on hypersonic boundary layer transition, M(1) = 7.5 - 15
|AIAA PAPER 86-1088| p 550 A86-38450
**SHOCK WAVE PROPAGATION**
Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660
**SHOCK WAVES**
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236
A method for the design of shock-free slender bodies of revolution p 554 A86-39054
Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios
|NASA-TM-88766| p 620 N86-27970
**SHORT TAKEOFF AIRCRAFT**
The STOL performance of a two-engine, USB powered-lift aircraft with cross-shafted fans
|SAE PAPER 851839| p 578 A86-38336
Fuel conservative guidance for shipboard landing of powered-lift STOL aircraft p 572 A86-39048
An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft
|NAL-TR-893| p 587 N86-27277
**SIGNAL PROCESSING**
Characteristics of synthetic aperture radars
p 610 A86-39683
TCAS Experimental Unit (TEU) hardware description
|FAA/PM-85/2| p 574 N86-27272
**SILANES**
Environmental and adhesive durability of aluminium-polymer systems protected with organic corrosion inhibitors p 601 A86-37708
**SILICON NITRIDES**
Processing study of injection molding of silicon nitride for engine applications
|SAE PAPER 851787| p 606 A86-38311
**SINGLE CRYSTALS**
Effects of section thickness and orientation on creep-rupture properties of two advanced single crystal alloys
|SAE PAPER 851785| p 601 A86-38309
**SINGULARITY (MATHEMATICS)**
A high order supersonic triplet singularity
|AIAA PAPER 86-1815| p 545 A86-37834
**SKIDDING**
Nonskid coating formulations
|AD-D012186| p 604 N86-27457
**SKIN FRICTION**
Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible?
|AGARD-R-723-ADD-1| p 556 N86-27187
**SLENDER BODIES**
A method for the design of shock-free slender bodies of revolution p 554 A86-39054
**SLENDER WINGS**
Calculation of asymmetric vortex separation on slender delta wings with a vortex-sheet model
|AIAA PAPER 86-1836| p 546 A86-37846
A wind tunnel study of active control technology on a high aspect ratio wing
|AIAA PAPER 86-0956| p 594 A86-38930
Wind tunnel test and analysis on gust load alleviation of a high-aspect-ratio wing
|NAL-TR-890| p 556 N86-27185
Vortex lift research: Early contributions and some current challenges p 556 N86-27191
Leading-edge vortex research: Some nonplanar concepts and current challenges p 556 N86-27192
**SLOPES**
The generation of tire cornering forces in aircraft with a free-swiveling nose gear
|SAE PAPER 851939| p 581 A86-38372
**SMALL PERTURBATION FLOW**
Nonisentropic unsteady three dimensional small disturbance potential theory
|AIAA PAPER 86-0863| p 552 A86-38898
**SODAR**
Windshear detection using a Doppler acoustic sounder (SODAR) p 614 A86-37484
**SOFTWARE ENGINEERING**
Users guide: Steady-state aerodynamic-loads program for shuttle TPS tiles
|NASA-TM-85724| p 600 N86-27406
**SOLID LUBRICANTS**
High-temperature lubrication systems for ring/liner applications in advanced heat engines
|AD-A164955| p 604 N86-26446
**SONIC BOOMS**
Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios
|NASA-TM-88766| p 620 N86-27970
**SOUND INTENSITY**
Advisory Circular. Estimated airplane noise levels in A-weighted decibels
|AC-36-3D| p 620 N86-27969
**SOUND PRESSURE**
Fine structure of subsonic jet noise
p 619 A86-39069
**SOUND PROPAGATION**
Flight effects on noise from coaxial dual flow. I - Unheated jets p 619 A86-39058
**SOUND TRANSMISSION**
Noise transmission into propeller aircraft
p 619 N86-27473
**SOUND WAVES**
Wave envelope and finite element approximations for turbofan noise radiation in flight p 619 A86-39057
**SPACE SHUTTLE ASCENT STAGE**
Particulate contaminant relocation during shuttle ascent
|NASA-TM-87794| p 600 N86-27351
**SPACE SHUTTLES**
Particulate contaminant relocation during shuttle ascent
|NASA-TM-87794| p 600 N86-27351
Users guide: Steady-state aerodynamic-loads program for shuttle TPS tiles
|NASA-TM-85724| p 600 N86-27406
**SPACECRAFT DESIGN**
Integrated aeroservoelastic tailoring of lifting surfaces
|AIAA PAPER 86-1005| p 594 A86-38946
**SPANWISE BLOWING**
An investigation of improving high angle of attack performance and flap effectiveness of a configuration with delta wing by spanwise blowing
|AIAA PAPER 86-1777| p 542 A86-37811
**SPATIAL DISTRIBUTION**
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
|AD-A164629| p 555 N86-26291
Airborne lidar measurements of El Chichon stratoshperic aerosols
|NASA-RP-1166| p 616 N86-27835
**SPATIAL MARCHING**
Progress in the development of parabolized Navier-Stokes (PNS) methodology for analyzing propulsive jet mixing problems
|AIAA PAPER 86-1115| p 551 A86-38473
**SPECTRAL METHODS**
A spectral hodograph method for shockless transonic two-dimensional flow
|AIAA PAPER 86-1793| p 543 A86-37824
**SPEECH RECOGNITION**
A comparison of voice and keyboard data entry for a helicopter navigation task
|AD-A163245| p 610 N86-26501
**SPLICING**
Optimized bolted joint
|NASA-CASE-LAR-13250-1| p 612 N86-27630
**SPRINGS (ELASTIC)**
A spring in the air --- launching device for RPV
p 590 A86-37345
**STABILITY AUGMENTATION**
An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft
|NAL-TR-893| p 587 N86-27277
**STABILITY DERIVATIVES**
Recent developments in techniques for dynamic simulation for the identification of stability parameters
p 562 N86-27246
Dynamic nonlinear airloads: Representation and measurement p 563 N86-27251
Correlation of predicted and free-flight responses near departure conditions of a high incidence research model
p 564 N86-27255
A computer programme for DATCOM methods of estimation of lateral stability and control derivatives
|NAL-TM-AE-8601| p 596 N86-27289
**STABILITY TESTS**
Recent developments in rotary-balance testing of fighter aircraft configurations at NASA Ames Research Center
p 562 N86-27242
**STANDARDS**
Aircraft ground support equipment standardization - The pros and cons of 'functional' vs 'technical' standardization
|SAE PAPER 851794| p 620 A86-38317
Minimum operational performance standards for airborne thunderstorm detection equipment
|RTCA/DO-191| p 617 N86-27851
**STATIC LOADS**
Static aeroelasticity in combat aircraft
|AGARD-R-725| p 613 N86-27678
**STATIONS**
Microwave Landing System (MLS) station interface control report
|DOT/FAA/PM-86/17| p 540 N86-27178
**STATISTICAL ANALYSIS**
A unified procedure for meeting power-spectral-density and statistical-discrete-gust requirements for flight in turbulence
|AIAA PAPER 86-1011| p 584 A86-38869
**STATISTICAL DISTRIBUTIONS**
Effect of crack growth rate variations on life predictions
|AIAA PAPER 86-0981| p 603 A86-38859
**STEADY FLOW**
Visualization of wing tip vortices in unsteady and steady wind
|AIAA PAPER 86-1096| p 551 A86-38457
Nonlinear problems in flight dynamics involving aerodynamic bifurcations p 563 N86-27249
**STEADY STATE**
Steady supersonic Navier-Stokes solutions of a 75 deg delta wing p 558 N86-27206
**STEERING**
European aircraft steering systems
|SAE PAPER 851940| p 581 A86-38373
**STIFFENING**
Buckling and final failure of graphite/PEEK stiffener sections
|AIAA PAPER 86-0921| p 608 A86-38831
**STIFFNESS**
Standard dynamics model experiments with the DFVLR/AVA transonic derivative balance
p 562 N86-27245

**STIFFNESS MATRIX**
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing [NASA-TM-86798] p 611 N86-26653

**STOCHASTIC PROCESSES**
Stochastic flutter of nonlinear aeroelastic structures with parameter random fluctuations [AIAA PAPER 86-0962] p 609 A86-38934

**STOPPING**
Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens --- semisubmersible platform [NLR-TR-84051-U] p 611 N86-26662

**STORMS**
NASA storm hazards research in lightning strikes to aircraft p 566 A86-37479

**STRAKES**
Pivotable strakes for high angle of attack control [SAE PAPER 851821] p 593 A86-38329

**STRAPDOWN INERTIAL GUIDANCE**
Improvement of strapdown system performance by means of numerical methods [BMFT-FB-W-85-011] p 575 N86-27275

**STRATEGY**
The C-17: An attempt at increased airlift versatility [AD-A164822] p 540 N86-26280

**STRATOSPHERE**
Airborne lidar measurements of El Chichon stratoshperic aerosols [NASA-RP-1166] p 616 N86-27835

**STRESS ANALYSIS**
Observations on compressive local buckling, postbuckling and crippling of graphite/epoxy airframe structure [AIAA PAPER 85-0923] p 608 A86-38833
Strength evaluation of helicopter composite bolted joints [AIAA PAPER 86-0973] p 606 A86-38853
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing [AIAA PAPER 86-0978] p 609 A86-38857
A study of cracking in the pressure bulkhead of a military transport aircraft [AIAA PAPER 86-0983] p 584 A86-38861

**STRESS-STRAIN RELATIONSHIPS**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies [AD-A163379] p 610 N86-26480

**STRUCTURAL ANALYSIS**
Combined, nonlinear aerodynamic and structural method for the aeroelastic design of a three-dimensional wing in supersonic flow [AIAA PAPER 86-1769] p 542 A86-37806
Structural analysis of the controlled impact demonstration of a jet transport airplane [AIAA PAPER 86-0939] p 583 A86-38836
Optimum design of large structures with multiple constraints [AIAA PAPER 86-0952] p 500 A86-38845

**STRUCTURAL DESIGN**
Combined, nonlinear aerodynamic and structural method for the aeroelastic design of a three-dimensional wing in supersonic flow [AIAA PAPER 86-1769] p 542 A86-37806
Design and use of Kevlar in aircraft structures [SAE PAPER 850893] p 583 A86-38520
ASTROS - An advanced software environment for automated design [AIAA PAPER 86-0856] p 618 A86-38807
Optimum design of large structures with multiple constraints [AIAA PAPER 86-0952] p 600 A86-38845
Influence of FBW - Control laws on structural design of modern transport aircraft --- fly by wire [AIAA PAPER 86-0953] p 584 A86-38846
Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing p 561 N86-27239
Large-Scale Advanced Prop-Fan (LAP) pitch change actuator and control design report [NASA-CR-174788] p 592 N86-27282
Impact damage to composite structures [AGARD-R-729] p 604 N86-27425

**STRUCTURAL DESIGN CRITERIA**
The design of repairable advanced composite structures [SAE PAPER 851830] p 606 A86-38335
Next generation aircraft structures - The need for co-ordinated Canadian R & D programs p 539 A86-39567

**STRUCTURAL STABILITY**
The dynamic instability of plate structures p 605 A86-37348

**STRUCTURAL VIBRATION**
Durability prediction of parallel fuel tank skins with fluid-structure interaction dynamics [AIAA PAPER 86-0935] p 591 A86-38927

**SUBCRITICAL FLOW**
Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method [NAL-TM-AE-8507] p 559 N86-27212

**SUBSONIC AIRCRAFT**
Interdependence of parameters important to the design of subsonic canard-configured aircraft [SAE PAPER 850865] p 581 A86-38506

**SUBSONIC FLOW**
The external drag of a simple axisymmetric body of revolution in subsonic and supersonic flow with variable mass flowthrough ratios [AIAA PAPER 86-1828] p 545 A86-37842
Application of the vortex-lattice method to high-angle-of-attack subsonic aerodynamics [SAE PAPER 851817] p 547 A86-38326
Numerical simulation of tip vortices of wings in subsonic and transonic flows [AIAA PAPER 86-1095] p 550 A86-38456
A calculation method for unsteady aerodynamic forces in the Laplace domain and its application to root loci [AIAA PAPER 86-0866] p 553 A86-38901
Vortex lift research: Early contributions and some current challenges p 556 N86-27191
A direct and inverse boundary layer method for subsonic flow over delta wings p 557 N86-27195
In-flight and wind tunnel leading-edge vortex study on the F-106B airplane p 557 N86-27198
Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247

**SUBSONIC SPEED**
Fine structure of subsonic jet noise p 619 A86-39069

**SUCTION**
Extensions of the concept of suction analogy to prediction of vortex lift effect p 556 N86-27193

**SUPERCRITICAL AIRFOILS**
Unsteady transonic flows past airfoils using the Euler equations [AIAA PAPER 86-1764] p 541 A86-37802

**SUPERCRITICAL WINGS**
Unsteady airload computations for airfoil oscillating in attached and separated compressible flow p 561 N86-27238

**SUPERSONIC AIRCRAFT**
Optimization of a supersonic wing by combining linear and Euler methods [SAE PAPER 851791] p 547 A86-38315
Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations [NASA-TM-87727] p 559 N86-27209
Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet [NASA-CR-178097] p 587 N86-27278

**SUPERSONIC AIRFOILS**
Supersonic airfoil optimization [AIAA PAPER 86-1818] p 545 A86-37837

**SUPERSONIC BOUNDARY LAYERS**
Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901

**SUPERSONIC FLOW**
Combined, nonlinear aerodynamic and structural method for the aeroelastic design of a three-dimensional wing in supersonic flow [AIAA PAPER 86-1769] p 542 A86-37806
Counterflow sonic nosejet into a supersonic stream [AIAA PAPER 86-1808] p 544 A86-37830
A high order supersonic triplet singularity [AIAA PAPER 86-1815] p 545 A86-37834
Wing and conical body of arbitrary cross-section combinations in supersonic flow [AIAA PAPER 86-1826] p 545 A86-37841
The external drag of a simple axisymmetric body of revolution in subsonic and supersonic flow with variable mass flowthrough ratios [AIAA PAPER 86-1828] p 545 A86-37842
Comparison of hot-wire measurement techniques in a Mach 3 pilot quiet tunnel p 605 A86-38235
A hot air tunnel for base bleed experimentation p 597 A86-38252
Experiments on supersonic turbulent flow development in a square duct [AIAA PAPER 86-1038] p 548 A86-38412
Influence of numerical dissipation in computing supersonic vortex-dominated flows [AIAA PAPER 86-1073] p 549 A86-38439
Effects of wind-tunnel noise on swept-cylinder transition at Mach 3.5 [AIAA PAPER 86-1085] p 550 A86-38447
Effects of cone surface waviness and freestream noise on transition in supersonic flow [AIAA PAPER 86-1086] p 550 A86-38448
Extensions of the concept of suction analogy to prediction of vortex lift effect p 556 N86-27193
An overview of the fundamental aerodynamics branch's research activities in wing leading-edge vortex flows at supersonic speeds p 558 N86-27207
Bifurcation theory applied to aircraft motions p 563 N86-27250

**SUPERSONIC JET FLOW**
Progress in the development of parabolized Navier-Stokes (PNS) methodology for analyzing propulsive jet mixing problems [AIAA PAPER 86-1115] p 551 A86-38473

**SUPERSONIC SPEEDS**
Navier-Stokes computations of lee-side flows over delta wings [AIAA PAPER 86-1049] p 548 A86-38420

**SUPERSONIC TRANSPORTS**
Planform effects for low-fineness ratio multibody configurations at supersonic speeds [AIAA PAPER 86-1799] p 544 A86-37825

**SUPERSONIC TURBINES**
Passive control of aerodynamically forced vibrations of supersonic turbomachine rotors by splitter blades [AIAA PAPER 86-0844] p 590 A86-38892

**SUPERSONIC WAKES**
Heat transfer and drag of a body in the far supersonic wake p 554 A86-39657

**SUPERSONIC WIND TUNNELS**
A hot air tunnel for base bleed experimentation p 597 A86-38252
Effects of cone surface waviness and freestream noise on transition in supersonic flow [AIAA PAPER 86-1086] p 550 A86-38448

**SURFACE LAYERS**
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies [AD-A163379] p 610 N86-26480

**SURFACE ROUGHNESS**
Effects of cone surface waviness and freestream noise on transition in supersonic flow [AIAA PAPER 86-1086] p 550 A86-38448

**SURFACE STABILITY**
Effects of structural nonlinearities on limit cycle response of aerodynamic surfaces [AIAA PAPER 86-0899] p 585 A86-38910

**SURFACE WATER**
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth [AD-A164719] p 611 N86-26603

**SURVEILLANCE RADAR**
Evaluation of the ASR-9 weather reflectivity product --- airport surveillance radar p 614 A86-37485

**SWEPT FORWARD WINGS**
The X-29 - A unique and innovative aerodynamic concept [SAE PAPER 851771] p 546 A86-38306
Three-dimensional unsteady flow fields elicited by a pitching forward swept wing [AIAA PAPER 86-1104] p 551 A86-38464
Experimental aeroelastic behavior of forward swept graphite/epoxy wings with rigid body freedoms [AIAA PAPER 86-0971] p 584 A86-38851
Classical flight dynamics of a variable forward-sweep-wing aircraft p 594 A86-39043
X-29A technology demonstrator flight test program overview [NASA-TM-86809] p 586 N86-26328
Divergence study of a high-aspect ratio, forward-swept wing [NASA-TM-87682] p 588 N86-27279

**SWEPT WINGS**
Combined, nonlinear aerodynamic and structural method for the aeroelastic design of a three-dimensional wing in supersonic flow [AIAA PAPER 86-1769] p 542 A86-37806
Drag-reduction characteristics of aft-swept wing tips [AIAA PAPER 86-1824] p 545 A86-37840
Swept wing-tip shapes for low-speed airplanes [SAE PAPER 851770] p 546 A86-38305
Pivotable strakes for high angle of attack control [SAE PAPER 851821] p 593 A86-38329
Further results of natural laminar flow flight test experiments [SAE PAPER 850862] p 581 A86-38504
Unsteady vortical flow around three-dimensional lifting surfaces p 553 A86-39052
Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme [NAL-TR-889T] p 555 N86-27184
Towards an advanced vortex flap system: The cavity flap p 557 N86-27200

Dynamic stall of swept and unswept oscillating wings
p 560 N86-27226

**SWEPTBACK WINGS**
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
[NASA-TM-86798] p 611 N86-26653

**SYNTHETIC APERTURE RADAR**
Characteristics of synthetic aperture radars
p 610 A86-39683

**SYSTEM FAILURES**
Failures in advanced flight control systems of future transport aircraft --- semisubmersible platform
[NLR-TR-84108-U] p 595 N86-26343

**SYSTEMS ENGINEERING**
An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft
[NAL-TR-893] p 587 N86-27277

**SYSTEMS INTEGRATION**
The integrated digital avionics system for the F-20 Tigershark
[SAE PAPER 851850] p 589 A86-38345

**SYSTEMS SIMULATION**
Aerospace simulation II; Proceedings of the Second Conference, San Diego, CA, January 23-25, 1986
p 596 A86-37176

Improvement of strapdown system performance by means of numerical methods
[BMFT-FB-W-85-011] p 575 N86-27275

## T

**TABLES (DATA)**
Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects
[NASA-TM-87723] p 555 N86-26289

**TAKEOFF**
The history and development of the repeatable release catapult holdback bar
[SAE PAPER 851942] p 581 A86-38375

**TARGET DRONE AIRCRAFT**
P T A - Design considerations for an airframe system and detailed design of fuel subsystem --- Pilotless Target Aircraft p 590 A86-37331

Designing compact electromechanical actuators for flight control p 593 A86-37332

**TARGET RECOGNITION**
Flight simulator: Comparison of resolution thresholds for two light valve video projectors
[AD-A164577] p 598 N86-26344

**TAXIING**
Aircraft flotation analysis - Current methods and perspective --- of ground performance evaluation
[SAE PAPER 851936] p 580 A86-38369

European aircraft steering systems
[SAE PAPER 851940] p 581 A86-38373

**TECHNOLOGY ASSESSMENT**
Canadair rotary wing, full scale engineering development. III p 575 A86-37330

The impact of technology on fighter aircraft requirements
[SAE PAPER 851841] p 579 A86-38338

Estimation of lift losses of hovering vehicles using a single jet
[SAE PAPER 851842] p 579 A86-38339

Research on the technology of an airplane concept for a Stationary High-Altitude Relay Platform (SHARP)
p 586 A86-39564

Next generation aircraft structures - The need for co-ordinated Canadian R & D programs
p 539 A86-39567

**TECHNOLOGY UTILIZATION**
Applications of sensor payloads p 588 A86-37343

The impact of technology on fighter aircraft requirements
[SAE PAPER 851841] p 579 A86-38338

Analyzing the cost effectiveness of using flight simulators in the Israeli Air Force
[AD-A164864] p 599 N86-26346

**TELEVISION CAMERAS**
Mechanical interface devices for automatic test equipment
[SAE PAPER 851795] p 606 A86-38318

**TEMPERATURE COMPENSATION**
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236

**TEMPERATURE DISTRIBUTION**
Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine
p 591 A86-38998

**TEMPERATURE PROFILES**
Plume characteristics of single-stream and dual-flow conventional and inverted-profile nozzles at equal thrust
[NASA-TM-87323] p 554 N86-26285

Profiles of temperature and density based on extremes at 5, 10, 20, 30 and 40 km p 616 N86-27727

**TENSILE STRESS**
Use of NDE to evaluate reflection cracking in airfield pavements
[AD-A164880] p 599 N86-27293

**TERMINAL FACILITIES**
Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project
[AD-A165073] p 575 N86-27273

**TERRAIN**
Applications of digital terrain data in flight operations
p 573 N86-26324

**TERRAIN ANALYSIS**
An terrain-aided guidance system with high convergence speed p 573 A86-39766

**TERRAIN FOLLOWING AIRCRAFT**
A new technique for terrain following/terrain avoidance guidance command generation p 574 N86-26325

**TEST EQUIPMENT**
Evaluation of JFTOT tube deposits by carbon burnoff --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851994] p 602 A86-38539

**TEST FACILITIES**
Instrumentation and testing techniques in the T2 transonic cryogenic wind tunnel at the ONERA/CERT
p 597 A86-38228

Aircraft Landing Dynamics Facility - A unique facility with new capabilities
[SAE PAPER 851938] p 598 A86-38371

**TEST PILOTS**
USAF Test Pilot School use of DIGITAC in systems testing
[SAE PAPER 851827] p 594 A86-38333

**THERMAL ENVIRONMENTS**
Aircraft nuclear survivability methods
[AD-A163218] p 587 N86-26332

**THERMAL PROTECTION**
Users guide: Steady-state aerodynamic-loads program for shuttle TPS tiles
[NASA-TM-85724] p 600 N86-27406

**THERMAL STABILITY**
The influence of JFTOT operating parameters on the assessment of fuel thermal stability --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851871] p 602 A86-38538

Evaluation of JFTOT tube deposits by carbon burnoff --- Jet Fuel Thermal Oxidation Tester
[SAE PAPER 851994] p 602 A86-38539

**THERMODYNAMIC EFFICIENCY**
Preliminary evaluation of a compound cycle engine for shipboard gensets
[NASA-CR-179451] p 611 N86-26629

**THERMODYNAMIC PROPERTIES**
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176840] p 610 N86-26546

**THERMOPLASTIC RESINS**
Buckling and final failure of graphite/PEEK stiffener sections
[AIAA PAPER 86-0921] p 608 A86-38831

**THICKNESS**
Effects of section thickness and orientation on creep-rupture properties of two advanced single crystal alloys
[SAE PAPER 851785] p 601 A86-38309

**THIN WINGS**
Application of the vortex-lattice method to high-angle-of-attack subsonic aerodynamics
[SAE PAPER 851817] p 547 A86-38326

A calculation method for unsteady aerodynamic forces in the Laplace domain and its application to root loci
[AIAA PAPER 86-0866] p 553 A86-38901

**THREAT EVALUATION**
What USAF aircraft should be the Wild Weasel of the 1990's?: An assessment of the F-4G, the F-15WW, and F-16WW
[AD-A164727] p 539 N86-26279

TCAS Experimental Unit (TEU) hardware description
[FAA/PM-85/2] p 574 N86-27272

**THREE DIMENSIONAL BOUNDARY LAYER**
Three-dimensional interaction of wakes and boundary layers
[AIAA PAPER 86-1820] p 545 A86-37838

A three-dimensional boundary-layer method for flow over delta wings with leading-edge separation
[SAE PAPER 851818] p 547 A86-38327

**THREE DIMENSIONAL FLOW**
Combined, nonlinear aerodynamic and structural method for the aeroelastic design of a three-dimensional wing in supersonic flow
[AIAA PAPER 86-1769] p 542 A86-37806

An implicit flux-difference splitting scheme for three-dimensional, incompressible Navier-Stokes solutions to leading edge vortex flows
[AIAA PAPER 86-1839] p 546 A86-37847

Block-structured solution of Euler equations for transonic flows
[AIAA PAPER 86-1080] p 549 A86-38443

Three-dimensional, conservative, Euler computations using patched grid systems and explicit methods
[AIAA PAPER 86-1081] p 549 A86-38444

Three-dimensional unsteady flow fields elicited by a pitching forward swept wing
[AIAA PAPER 86-1104] p 551 A86-38464

Nonisentropic unsteady three dimensional small disturbance potential theory
[AIAA PAPER 86-0863] p 552 A86-38898

Unsteady vortical flow around three-dimensional lifting surfaces p 553 A86-39052

Three-dimensional inviscid flow in mixers. I - Mixer analysis using a Cartesian grid p 554 A86-39090

Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme
[NAL-TR-889T] p 555 N86-27184

Laser velocimetry in highly three-dimensional and vortical flows p 557 N86-27197

**THREE DIMENSIONAL MOTION**
Three dimensional unsteady aerodynamics and aeroelastic response of advanced turboprops
[AIAA PAPER 86-0846] p 591 A86-38894

**THRUST VECTOR CONTROL**
Aircraft performance optimization with thrust vector control
[AD-A165388] p 587 N86-26334

**THUNDERSTORMS**
Wide area real-time thunderstorm mapping using LPATS - The lightning position and tracking system
p 614 A86-37487

Minimum operational performance standards for airborne thunderstorm detection equipment
[RTCA/DO-191] p 617 N86-27851

**TILTING ROTORS**
Folding tiltrotor technology demonstrator - The next step for tiltrotor technology
[SAE PAPER 851844] p 579 A86-38341

**TIME LAG**
CGI delay compensation --- Computer Generated Image p 617 A86-37194

Method for determining the time delay of the pilot-static tubing system of aircraft --- semisubmersible platform
[NLR-TR-83075-U] p 589 N86-26335

**TIME MARCHING**
A computational transonic flutter boundary tracking procedure
[AIAA PAPER 86-0902] p 553 A86-38913

Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176840] p 610 N86-26546

**TITANIUM ALLOYS**
Fatigue behavior of Ti-6Al-4V powder metallurgy compacts p 603 A86-39617

**TOOLS**
A cementitious tooling/molding material - Room temperature castable, high temperature capable
[SAE PAPER 850904] p 607 A86-38522

Generation of an electroformed nickel mold for use in manufacturing composite parts
[SAE PAPER 850905] p 607 A86-38523

**TORSION**
An experimental study of the aerodynamics of incipient torsional stall flutter
[AIAA PAPER 86-0901] p 553 A86-38912

**TORSO**
Upper torso restraint systems --- for fixed wing and rotorcraft aircraft
[SAE PAPER 851848] p 567 A86-38344

**TOXIC HAZARDS**
The F-16 aircraft and hydrazine - An industrial hygiene perspective
[SAE PAPER 851971] p 568 A86-38381

**TOXICITY**
Evaluation of less toxic fuels for aircraft emergency power systems
[SAE PAPER 851974] p 601 A86-38384

**TRACKING FILTERS**
An efficient decision-making-free filter for processes with abrupt changes --- aircraft tracking
[NLR-MP-84060-U] p 618 N86-27018

**TRACKING NETWORKS**
Wide area real-time thunderstorm mapping using LPATS - The lightning position and tracking system
p 614 A86-37487

**TRAFFIC CONTROL**
Air traffic control (ATC) and vessel traffic systems (VTS) p 572 A86-39558

**TRAILING EDGE FLAPS**

An investigation of improving high angle of attack performance and flap effectiveness of a configuration with delta wing by spanwise blowing
|AIAA PAPER 86-1777| p 542 A86-37811

Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method
|NAL-TM-AE-8507| p 559 N86-27212

**TRAILING EDGES**

Investigations of transonic trailing edge flows
p 541 A86-37192

**TRAINING AIRCRAFT**

Alpha Jet Training System single aircraft concept
|SAE PAPER 851766| p 598 A86-38301

Hawk - The British fighting trainer
|SAE PAPER 851768| p 578 A86-38303

The EMB-312 Tucano - A Brazilian trainer
|SAE PAPER 851769| p 578 A86-38304

**TRAINING SIMULATORS**

Real-time simulator for helicopter rotor wind-tunnel operations p 596 A86-37179

**TRAJECTORIES**

Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

**TRAJECTORY ANALYSIS**

Math model study of a proposed glide slope for runway 13R, Dallas-Fort Worth Airport, Texas
|AD-A164907| p 573 N86-26315

A new technique for terrain following/terrain avoidance guidance command generation p 574 N86-26325

**TRANSDUCERS**

Preliminary results of unsteady blade surface pressure measurements for the SR-3 propeller
|NASA-TM-87352| p 559 N86-27213

**TRANSIENT LOADS**

The dynamic instability of plate structures
p 605 A86-37348

**TRANSITION FLOW**

Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236

A faster 'transition' to laminar flow
|SAE PAPER 851855| p 548 A86-38347

Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266

**TRANSMISSION LINES**

Analysis of direct and nearby lightning strike data for aircraft
|NASA-CR-172127| p 617 N86-27855

**TRANSMISSIONS (MACHINE ELEMENTS)**

A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant
|SAE PAPER 851832| p 607 A86-38530

Future trends for U.S. Naval aviation propulsion system lubricants
|SAE PAPER 851835| p 608 A86-38533

**TRANSONIC COMPRESSORS**

Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
|NASA-CR-176840| p 610 N86-26546

**TRANSONIC FLOW**

Investigations of transonic trailing edge flows
p 541 A86-37192

Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769

Unsteady transonic flows past airfoils using the Euler equations
|AIAA PAPER 86-1764| p 541 A86-37802

A two-dimensional transonic aerodynamic design method
|AIAA PAPER 86-1793| p 543 A86-37823

A spectral hodograph method for shockless transonic two-dimensional flow
|AIAA PAPER 86-1796| p 543 A86-37824

Counterflow sonic nosejet into a supersonic stream
|AIAA PAPER 86-1808| p 544 A86-37830

Block-structured solution of Euler equations for transonic flows
|AIAA PAPER 86-1080| p 549 A86-38443

Transonic flow solutions on a blunt, finned body of revolution using the Euler equations
|AIAA PAPER 86-1082| p 549 A86-38445

Transonic potential flow calculations by two artificial density methods
|AIAA PAPER 86-1084| p 549 A86-38446

Numerical simulation of tip vortices of wings in subsonic and transonic flows
|AIAA PAPER 86-1095| p 550 A86-38456

Unsteady transonic flow calculations for wing-fuselage configurations
|AIAA PAPER 86-0862| p 552 A86-38897

A computational transonic flutter boundary tracking procedure
|AIAA PAPER 86-0902| p 553 A86-38913

Computation of transonic flow about helicopter rotor blades p 554 A86-39053

Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme
|NAL-TR-889T| p 555 N86-27184

Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible?
|AGARD-R-723-ADD-1| p 556 N86-27187

Leading-edge vortex research: Some nonplanar concepts and current challenges p 556 N86-27192

In-flight and wind tunnel leading-edge vortex study on the F-106B airplane p 557 N86-27198

Review of SMP 1984 Symposium on Transonic Unsteady Aerodynamics and its Aeroelastic Applications
p 561 N86-27236

Transonic aerodynamic and aeroelastic characteristics of a variable sweep wing p 561 N86-27237

Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing
p 561 N86-27239

New dynamic testing techniques and related results at FFA p 562 N86-27244

Standard dynamics model experiments with the DFVLR/AVA transonic derivative balance
p 562 N86-27245

Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261

Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

**TRANSONIC SPEED**

Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft
p 605 A86-38236

Transonic aeroelasticity of wings with tip stores
|AIAA PAPER 86-1007| p 553 A86-38948

**TRANSONIC WIND TUNNELS**

National transonic facility Mach numer system
p 597 A86-38076

Instrumentation and testing techniques in the T2 transonic cryogenic wind tunnel at the ONERA/CERT
p 597 A86-38228

Comparison of hot-wire measurement techniques in a Mach 3 pilot quiet tunnel p 605 A86-38235

Application of optical interferometry in compressible flows p 546 A86-38258

Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects
|NASA-TM-87723| p 555 N86-26289

Divergence study of a high-aspect ratio, forward-swept wing
|NASA-TM-87682| p 588 N86-27279

**TRANSPORT AIRCRAFT**

Prospects for destructive self-induced interactions in a vortex pair due to sinusoidal disturbances --- of large transport aircraft wakes
|AIAA PAPER 86-1791| p 543 A86-37821

PAN AIR analysis of a transport high-lift configuration
|AIAA PAPER 86-1811| p 544 A86-37832

NASA experiments onboard the controlled impact demonstration
|SAE PAPER 851885| p 568 A86-38352

Antimisting fuel technology for transport category aircraft
|SAE PAPER 851886| p 568 A86-38353

FAA structural crash dynamics program update - Transport category aircraft
|SAE PAPER 851887| p 568 A86-38354

Transport aircraft crashworthiness requirements - An industry view
|SAE PAPER 851888| p 580 A86-38355

Structural analysis of the controlled impact demonstration of a jet transport airplane
|AIAA PAPER 86-0939| p 583 A86-38836

The C-17: An attempt at increased airlift versatility
|AD-A164822| p 540 N86-26280

Flight test guide for certification of transport category airplanes
|FAA-AC-25-7| p 587 N86-26329

Evaluation of 3 numerical methods for propulsion integration studies on transonic transport configurations
|NASA-TM-87727| p 559 N86-27209

Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263

KRASH85 user's guide: Input/output format
|DOT/FAA/CT-85/10-REV| p 618 N86-27926

Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters
|UTIAS-307| p 618 N86-27929

**TRANSPORTATION**

Transportation safety recommendations adopted during the month of December 1985
|PB85-916612| p 569 N86-26301

**TRIBOLOGY**

High-temperature lubrication systems for ring/liner applications in advanced heat engines
|AD-A164955| p 604 N86-26446

**TRITIUM**

Multistage metal hydride compressor
|DE86-001965| p 604 N86-27465

**TURBINE BLADES**

Structural tailoring of engine blades (STAEBL) user's manual
|NASA-CR-175113| p 592 N86-27284

**TURBINE ENGINES**

Structural tailoring of engine blades (STAEBL) theoretical manual
|NASA-CR-175112| p 592 N86-27283

**TURBINE EXHAUST NOZZLES**

Plume characteristics of single-stream and dual-flow conventional and inverted-profile nozzles at equal thrust
|NASA-TM-87323| p 554 N86-26285

**TURBINES**

Aerodynamic effects of wingtip-mounted propellers and turbines
|AIAA PAPER 86-1802| p 544 A86-37826

Properties of aircraft fuels and related materials
|AD-A164532| p 604 N86-27461

**TURBOFAN AIRCRAFT**

The STOL performance of a two-engine, USB powered-lift aircraft with cross-shafted fans
|SAE PAPER 851839| p 578 A86-38336

**TURBOFAN ENGINES**

Wave envelope and finite element approximations for turbofan noise radiation in flight p 619 A86-39057

Three-dimensional inviscid flow in mixers. I - Mixer analysis using a Cartesian grid p 554 A86-39090

The General Electric F404 - engine of the RAAF's new fighter
|AD-A164562| p 592 N86-26338

Effect of emerging technology on a convertible, business/interceptor, supersonic-cruise jet
|NASA-CR-178097| p 587 N86-27278

Properties of aircraft fuels and related materials
|AD-A164532| p 604 N86-27461

**TURBOJET ENGINES**

Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine
p 591 A86-38998

**TURBOMACHINE BLADES**

Reduced Navier-Stokes (RNS relaxation procedure for internal flows with interaction)
|SAE PAPER 851790| p 547 A86-38314

**TURBOMACHINERY**

Off-design operation of turbomachines --- French book
p 591 A86-38956

**TURBOPROP AIRCRAFT**

The EMB-312 Tucano - A Brazilian trainer
|SAE PAPER 851769| p 578 A86-38304

Three dimensional unsteady aerodynamics and aeroelastic response of advanced turboprops
|AIAA PAPER 86-0846| p 591 A86-38894

**TURBOPROP ENGINES**

A new approach to automated gas turbine engine testing p 597 A86-38070

**TURBULENCE**

Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible?
|AGARD-R-723-ADD-1| p 556 N86-27187

**TURBULENCE EFFECTS**

Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts p 615 A86-37497

Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios
|NASA-TM-88766| p 620 N86-27970

**TURBULENT BOUNDARY LAYER**

Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901

The interaction between a strong longitudinal vortex and a turbulent boundary layer
|AIAA PAPER 86-1071| p 549 A86-38437

Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence --- graph theory
|NLR-MP-84040-U| p 555 N86-26293

La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984
|ESA-TT-907| p 559 N86-27217

Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil
p 560 N86-27228

Noise transmission into propeller aircraft
p 619 N86-27473

Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios
|NASA-TM-88766| p 620 N86-27970
**TURBULENT FLOW**
Experiments on supersonic turbulent flow development in a square duct
|AIAA PAPER 86-1038| p 548 A86-38412
Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter
|AIAA PAPER 86-1069| p 548 A86-38436
An investigation of the effects of the propeller slipstream of a laminar wing boundary layer
|SAE PAPER 850859| p 551 A86-38502
Wind tunnel test and analysis on gust load alleviation of a high-aspect-ratio wing
|NAL-TR-890| p 556 N86-27185
Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics
|AGARD-CP-386| p 560 N86-27224
Experimental study of the effect of turbulence on dynamic stalling p 565 N86-27264
**TURBULENT MIXING**
Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901
**TURBULENT WAKES**
Investigations of transonic trailing edge flows p 541 A86-37192
**TURNING FLIGHT**
Aircraft performance optimization with thrust vector control
|AD-A165388| p 587 N86-26334
**TWO DIMENSIONAL FLOW**
A two-dimensional transonic aerodynamic design method
|AIAA PAPER 86-1793| p 543 A86-37823
A spectral hodograph method for shockless transonic two-dimensional flow
|AIAA PAPER 86-1796| p 543 A86-37824
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
|AD-A164629| p 555 N86-26291
Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247

## U

**UH-60A HELICOPTER**
Effects of simulator variations on the fidelity of a UH-60 Black Hawk simulation p 596 A86-37178
**UNSTEADY FLOW**
Unsteady transonic flows past airfoils using the Euler equations
|AIAA PAPER 86-1764| p 541 A86-37802
Visualization of wing tip vortices in unsteady and steady wind
|AIAA PAPER 86-1036| p 551 A86-38457
Three-dimensional unsteady flow fields elicited by a pitching forward swept wing
|AIAA PAPER 86-1104| p 551 A86-38464
Unsteady aerodynamics of rapidly pitched airfoils
|AIAA PAPER 86-1105| p 551 A86-38465
Three dimensional unsteady aerodynamics and aeroelastic response of advanced turboprops
|AIAA PAPER 86-0846| p 591 A86-38894
Unsteady transonic flow calculations for wing-fuselage configurations
|AIAA PAPER 86-0862| p 552 A86-38897
Nonisentropic unsteady three dimensional small disturbance potential theory
|AIAA PAPER 86-0863| p 552 A86-38898
A new approach to finite state modelling of unsteady aerodynamics
|AIAA PAPER 86-0865| p 552 A86-38900
A calculation method for unsteady aerodynamic forces in the Laplace domain and its application to root loci
|AIAA PAPER 86-0866| p 553 A86-38901
Application of the unsteady vortex-lattice method to the nonlinear two-degree-of-freedom aeroelastic equations
|AIAA PAPER 86-0867| p 585 A86-38902
Recurrent identification of unsteady aerodynamic forces of elastic vehicles p 554 A86-39762
Unsteady aerodynamics-fundamentals and applications to aircraft dynamics
|NASA-TM-88768| p 555 N86-27182
Preliminary results of unsteady blade surface pressure measurements for the SR-3 propeller
|NASA-TM-87352| p 559 N86-27213
A vortex point method for calculating inviscid incompressible flows around rotary wings p 612 N86-27219
Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics
|AGARD-CP-386| p 560 N86-27224
A critical look at dynamic simulation of viscous flow p 560 N86-27230
Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations: Dynamic stall p 561 N86-27231
Computational aspects of unsteady flows p 561 N86-27232
Review of SMP 1984 Symposium on Transonic Unsteady Aerodynamics and its Aeroelastic Applications p 561 N86-27236
Transonic aerodynamic and aeroelastic characteristics of a variable sweep wing p 561 N86-27237
Unsteady airload computations for airfoil oscillating in attached and separated compressible flow p 561 N86-27238
Unsteady vortex airfoil interaction p 562 N86-27240
Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241
Recent experiences of unsteady aerodynamic effects on aircraft flight dynamics at high angle of attack p 564 N86-27252
Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253
On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254
Effects of aerodynamic lags on aircraft responses p 564 N86-27257
Gust alleviation on a transport airplane p 565 N86-27259
Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261
Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263
**UNSTEADY STATE**
Unsteady forces on counter-rotating propeller blades
|AIAA PAPER 86-1804| p 590 A86-37827
Unsteady aerodynamics-fundamentals and applications to aircraft dynamics
|NASA-TM-88768| p 555 N86-27182
**UNSWEPT WINGS**
Dynamic stall of swept and unswept oscillating wings p 560 N86-27226
**UPPER ATMOSPHERE**
Upper air forecasting for aviation in the United States p 615 A86-37501
**UPPER SURFACE BLOWING**
Euler solutions for aircraft configurations employing upper surface blowing (USB)
|AIAA PAPER 86-1767| p 542 A86-37805
**USER MANUALS (COMPUTER PROGRAMS)**
A microcomputer pollution model for civilian airports and Air Force bases
|AD-A163232| p 616 N86-26714
Structural tailoring of engine blades (STAEBL) theoretical manual
|NASA-CR-175112| p 592 N86-27283
Users guide: Steady-state aerodynamic-loads program for shuttle TPS tiles
|NASA-TM-85724| p 600 N86-27406
**USER REQUIREMENTS**
Structural tailoring of engine blades (STAEBL) user's manual
|NASA-CR-175113| p 592 N86-27284

## V

**V/STOL AIRCRAFT**
A method for estimating jet reaction control effectiveness
|AIAA PAPER 86-1805| p 593 A86-37828
X-wing - A low disc-loading V/STOL for the Navy
|SAE PAPER 851772| p 578 A86-38307
Requirements for future RALS/STOVL operating concepts --- Remote Augmented Lift System
|SAE PAPER 851840| p 578 A86-38337
Estimation of lift losses of hovering vehicles using a single jet
|SAE PAPER 851842| p 579 A86-38339
Results of piloted simulation of Grumman Design 698
|SAE PAPER 851846| p 579 A86-38342
Harrier III-AV8B with a modern engine
|SAE PAPER 851881| p 579 A86-38349
The significance of advanced technology engines on V/STOL systems
|SAE PAPER 851882| p 579 A86-38350
**VACUUM SYSTEMS**
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 609 A86-38876
**VANADIUM ALLOYS**
Fatigue behavior of Ti-6Al-4V powder metallurgy compacts p 603 A86-39617
**VANES**
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
|NASA-CR-177260| p 599 N86-27291
**VAPORS**
Properties of aircraft fuels and related materials
|AD-A164532| p 604 N86-27461
**VARIABLE PITCH PROPELLERS**
Large-Scale Advanced Prop-Fan (LAP) pitch change actuator and control design report
|NASA-CR-174786| p 592 N86-27282
**VARIABLE SWEEP WINGS**
Vortex-induced bending oscillation of a swept wing
|AIAA PAPER 86-1773| p 542 A86-37809
Transonic aerodynamic and aeroelastic characteristics of a variable sweep wing p 561 N86-27237
**VELOCITY MEASUREMENT**
An experimental investigation of vortex breakdown on a delta wing p 557 N86-27196
Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil p 560 N86-27228
**VERTEBRAL COLUMN**
Crash-resistant crewseat limit-load optimization through dynamic testing with cadavers
|AD-A164828| p 569 N86-26298
**VERTICAL AIR CURRENTS**
A cold-season North American climatology of strong vertical wind shear p 614 A86-37466
Numerical simulation of precipitation induced downbursts p 615 A86-37496
**VIBRATION**
Development of a temperature-compensated hot-film anemometer system for boundary-layer transition detection on high-performance aircraft p 605 A86-38236
Recent developments in the dynamics of advanced rotor systems. I p 586 A86-39597
Flight test guide for certification of transport category airplanes
|FAA-AC-25-7| p 587 N86-26329
The Shock and Vibration Digest, volume 18, no. 1
|AD-A165726| p 612 N86-27468
The Shock and Vibration Digest, volume 17, no. 8
|AD-A165115| p 612 N86-27471
Noise transmission into propeller aircraft p 619 N86-27473
**VIBRATION DAMPING**
A unified formulation of rotor load prediction methods p 576 A86-37774
Passive control of aerodynamically forced vibrations of supersonic turbomachine rotors by splitter blades
|AIAA PAPER 86-0844| p 590 A86-38892
Stochastic flutter of nonlinear aeroelastic structures with parameter random fluctuations
|AIAA PAPER 86-0962| p 609 A86-38934
Effects of nonlinear damping on random response of beams to acoustic loading
|AIAA PAPER 86-1004| p 609 A86-38945
Frequency domain synthesis of a robust flutter suppression control law p 594 A86-39042
Aeroelastic control of oblique-wing aircraft
|NASA-TM-86808| p 595 N86-26340
**VIBRATION ISOLATORS**
Six degree-of-freedom LIVE isolation systems, part 1
|NASA-CR-177928| p 587 N86-26331
**VIBRATION MODE**
A wind tunnel study of active control technology on a high aspect ratio wing
|AIAA PAPER 86-0956| p 594 A86-38930
**VIBRATION TESTS**
Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406
**VISCOUS DAMPING**
Effects of nonlinear damping on random response of beams to acoustic loading
|AIAA PAPER 86-1004| p 609 A86-38945
**VISCOUS DRAG**
Analytical study of three-surface lifting systems
|SAE PAPER 850866| p 552 A86-38507
**VISCOUS FLOW**
Inviscid and viscous simulations of high angle of attack flows
|SAE PAPER 851820| p 548 A86-38328
Analysis of transitional separation bubbles on infinite swept wings
|NASA-CR-3956| p 555 N86-26288
Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme
|NAL-TR-889T| p 555 N86-27184
Vortex lift research: Early contributions and some current challenges p 556 N86-27191
Viscous vortical flow calculations over delta wings p 558 N86-27202
A critical look at dynamic simulation of viscous flow p 560 N86-27230

**VISUAL FLIGHT RULES**
Technical support of the Wall Street/Battery Park city heliport MLS (Microwave Landing System) project |AD-A165073| p 575 N86-27273
**VISUAL PERCEPTION**
Flight simulator: Comparison of resolution thresholds for two light valve video projectors |AD-A164577| p 598 N86-26344
FLIR, NVG and HMS/D systems for helicopter operation: Review p 619 N86-26804
**VOICE COMMUNICATION**
A comparison of voice and keyboard data entry for a helicopter navigation task |AD-A163245| p 610 N86-26501
**VOLCANOES**
The hazards of ash clouds to civil air transport p 566 A86-37477
Airborne lidar measurements of El Chichon stratoshperic aerosols |NASA-RP-1166| p 616 N86-27835
**VOLCANOLOGY**
Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation p 566 A86-37478
**VORTEX ALLEVIATION**
Vortex flow hysteresis p 558 N86-27201
**VORTEX BREAKDOWN**
Prospects for destructive self-induced interactions in a vortex pair due to sinusoidal disturbances --- of large transport aircraft wakes |AIAA PAPER 86-1791| p 543 A86-37821
An experimental investigation of vortex breakdown on a delta wing p 557 N86-27196
**VORTEX FLAPS**
A comparison of experimental and numerical results for delta wings with vortex flaps |AIAA PAPER 86-1840| p 546 A86-37848
Vortex Flow Aerodynamics, volume 1 |NASA-CP-2416-VOL-1| p 556 N86-27190
Leading-edge vortex research: Some nonplanar concepts and current challenges p 556 N86-27192
Towards an advanced vortex flap system: The cavity flap p 557 N86-27200
Water tunnel results of leading-edge vortex flap tests on a delta wing vehicle p 558 N86-27208
**VORTEX SHEDDING**
Application of the vortex-lattice method to high-angle-of-attack subsonic aerodynamics |SAE PAPER 851817| p 547 A86-38326
**VORTEX SHEETS**
The use of curved higher order panels for vortex sheet modeling |AIAA PAPER 86-1812| p 544 A86-37833
Calculation of asymmetric vortex separation on slender delta wings with a vortex-sheet model |AIAA PAPER 86-1836| p 546 A86-37846
Recent extensions to the free-vortex-sheet theory for expanded convergence capability p 556 N86-27194
**VORTICES**
Vortex-induced bending oscillation of a swept wing |AIAA PAPER 86-1773| p 542 A86-37809
Flow structure of lateral wing-tip blowing |AIAA PAPER 86-1810| p 544 A86-37831
An implicit flux-difference splitting scheme for three-dimensional, incompressible Navier-Stokes solutions to leading edge vortex flows |AIAA PAPER 86-1839| p 546 A86-37847
Navier-Stokes computations of lee-side flows over delta wings |AIAA PAPER 86-1049| p 548 A86-38420
Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter |AIAA PAPER 86-1069| p 548 A86-38436
The interaction between a strong longitudinal vortex and a turbulent boundary layer |AIAA PAPER 86-1071| p 549 A86-38437
Influence of numerical dissipation in computing supersonic vortex-dominated flows |AIAA PAPER 86-1073| p 549 A86-38439
Application of the unsteady vortex-lattice method to the nonlinear two-degree-of-freedom aeroelastic equations |AIAA PAPER 86-0867| p 585 A86-38902
Vortex Flow Aerodynamics, volume 1 |NASA-CP-2416-VOL-1| p 556 N86-27190
Vortex lift research: Early contributions and some current challenges p 556 N86-27191
Leading-edge vortex research: Some nonplanar concepts and current challenges p 556 N86-27192
Extensions of the concept of suction analogy to prediction of vortex lift effect p 556 N86-27193
An experimental investigation of vortex breakdown on a delta wing p 557 N86-27196
In-flight and wind tunnel leading-edge vortex study on the F-106B airplane p 557 N86-27198
Basic studies on delta wing flow modifications by means of apex fences p 557 N86-27199
Towards an advanced vortex flap system: The cavity flap p 557 N86-27200
Vortex flow hysteresis p 558 N86-27201
Viscous vortical flow calculations over delta wings p 558 N86-27202
An Euler aerodynamic method for leading-edge vortex flow simulation p 558 N86-27203
Computation of leading-edge vortex flows p 558 N86-27205
An overview of the fundamental aerodynamics branch's research activities in wing leading-edge vortex flows at supersonic speeds p 558 N86-27207
Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method |NAL-TM-AE-8507| p 559 N86-27212
A vortex point method for calculating inviscid incompressible flows around rotary wings p 612 N86-27219
Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics |AGARD-CP-386| p 560 N86-27224
Dynamic stall of swept and unswept oscillating wings p 560 N86-27226
Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil p 560 N86-27228
Wing profile in stalled position subject to a flow of alternating potential and strong vortex p 560 N86-27229
Unsteady vortex airfoil interaction p 562 N86-27240
Unsteady interactions of transonic airfoils with gusts and concentrated vortices p 565 N86-27261
Modelling of the vortex-airfoil interaction p 565 N86-27262
Experimental study of the effect of turbulence on dynamic stalling p 565 N86-27264
**VULNERABILITY**
Aircraft nuclear survivability methods |AD-A163218| p 587 N86-26332

**W**

**WAKES**
Three-dimensional interaction of wakes and boundary layers |AIAA PAPER 86-1820| p 545 A86-37838
Wake imaging system applications at the Boeing Aerodynamics Laboratory |SAE PAPER 851895| p 606 A86-38358
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes |AD-A164629| p 555 N86-26291
**WALL FLOW**
Analysis of transitional separation bubbles on infinite swept wings |NASA-CR-3956| p 555 N86-26288
Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects |NASA-TM-87723| p 555 N86-26289
**WARFARE**
What USAF aircraft should be the Wild Weasel of the 1990's?: An assessment of the F-4G, the F-15WW, and F-16WW |AD-A164727| p 539 N86-26279
Flight simulator: Comparison of resolution thresholds for two light valve video projectors |AD-A164577| p 598 N86-26344
**WARNING SYSTEMS**
Low altitude wind-shear protection can be attained p 569 A86-39553
**WARPAGE**
Accurate dynamic theory for supermaneuverable aircraft wings |AIAA PAPER 86-1006| p 585 A86-38947
**WATER**
Development of the portable water separometer for the WSIM test |SAE PAPER 851870| p 608 A86-38537
**WATER DEPTH**
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth |AD-A164719| p 611 N86-26603
**WATER TUNNEL TESTS**
Water tunnel results of leading-edge vortex flap tests on a delta wing vehicle p 558 N86-27208
**WAVE PROPAGATION**
Experimental and theoretical study of the effect of wave propagation on the postitional accuracy of Omega navigation in Germany --- German thesis p 572 A86-38974
**WEAPON SYSTEMS**
The significance of advanced technology engines on V/STOL systems |SAE PAPER 851892| p 579 A86-38350
Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253
**WEAR RESISTANCE**
Nonskid coating formulations |AD-D012186| p 604 N86-27457
**WEATHER**
Evaluation of the ASR-9 weather reflectivity product --- airport surveillance radar p 614 A86-37485
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 3 of 1984 accidents |PB85-916922| p 570 N86-26303
Aircraft accident reports, brief format, US Civil and Foreign Aviation Issue Number 4 of 1984 accidents |PB85-916923| p 570 N86-26304
**WEATHER FORECASTING**
International Conference on the Aviation Weather System, 2nd, Universite du Quebec, Montreal, Canada, June 19-21, 1985, Preprints p 613 A86-37451
The crash of C-GTLA - The cumulative effects of small defects and a hint of a previously unrecognized major meteorological hazard p 567 A86-37489
Categorization of atmospheric turbulence in terms of aircraft response for use in turbulence reports and forecasts p 615 A86-37497
Use of computer technology in the operations of the national aviation weather advisory unit p 615 A86-37500
The aviation weather forecasting task force - Assessing the current system p 616 A86-37504
**WEATHER STATIONS**
Evaluating the new automated weather observing system p 615 A86-37491
**WEIGHT MEASUREMENT**
Douglas Automated Weighing System p 597 A86-38069
**WEIGHT REDUCTION**
Avionics system architecture for Beechcraft Starship 1 |SAE PAPER 851851| p 589 A86-38346
Lightweight hydraulic system technology - 8000 psi update --- for military aircraft |SAE PAPER 851910| p 580 A86-38365
**WHEELS**
Aircraft wheel design and proving p 583 A86-38721
Comparative study of nondestructive pavement testing, WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies |AD-A163379| p 610 N86-26480
**WIND EFFECTS**
Terrain-induced wind shear - Potential cause of Jetstar accident p 566 A86-37482
Aircraft liftmeter |NASA-CASE-LAR-12518-1| p 590 N86-27280
**WIND MEASUREMENT**
Installation of a bleed air heated radome/air motion sensing system on a Beech King Air 200 aircraft |SAE PAPER 851811| p 589 A86-38322
**WIND SHEAR**
A cold-season North American climatology of strong vertical wind shear p 614 A86-37466
Terrain-induced wind shear - Potential cause of Jetstar accident p 566 A86-37482
Windshear detection using a Doppler acoustic sounder (SODAR) p 614 A86-37484
The classify, locate, and avoid wind shear (CLAWS) project at Denver's Stapleton International Airport - Operational testing of terminal weather hazard warnings with an emphasis on microburst wind shear p 615 A86-37495
Wind shear studies and cockpit integration |SAE PAPER 851812| p 593 A86-38323
Low altitude wind-shear protection can be attained p 569 A86-39553
Aircraft liftmeter |NASA-CASE-LAR-12518-1| p 590 N86-27280
**WIND TUNNEL APPARATUS**
Instrumentation and testing techniques in the T2 transonic cryogenic wind tunnel at the ONERA/CERT p 597 A86-38228
Wake imaging system applications at the Boeing Aerodynamics Laboratory |SAE PAPER 851895| p 606 A86-38358
New dynamic testing techniques and related results at FFA p 562 N86-27244
Recent developments in techniques for dynamic simulation for the identification of stability parameters p 562 N86-27246
Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse |NASA-CR-177260| p 599 N86-27291

**WIND TUNNEL CALIBRATION**
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

**WIND TUNNEL MODELS**
New dynamic testing techniques and related results at FFA p 562 N86-27244
Standard dynamics model experiments with the DFVLR/AVA transonic derivative balance
p 562 N86-27245
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295
Development, construction, and manufacturing of wind tunnel models for aerodynamic investigations
|BMFT-FB-W-85-012| p 600 N86-27296

**WIND TUNNEL TESTS**
Wind tunnel test of a model rotor with a free-tip
|AIAA PAPER 86-1781| p 577 A86-37813
Experimental investigation of rotorcraft hub and shaft fairing drag reduction
|AIAA PAPER 86-1783| p 577 A86-37814
Planform effects for low-fineness ratio multibody configurations at supersonic speeds
|AIAA PAPER 86-1799| p 544 A86-37825
Flow structure of lateral wing-tip blowing
|AIAA PAPER 86-1810| p 544 A86-37831
Three-dimensional interaction of wakes and boundary layers
|AIAA PAPER 86-1820| p 545 A86-37838
A comparison of experimental and numerical results for delta wings with vortex flaps
|AIAA PAPER 86-1840| p 546 A86-37848
Instrumentation and other issues in non-linear dynamic testing in wind tunnels p 597 A86-38248
A hot air tunnel for base bleed experimentation
p 597 A86-38252
Wind tunnel free-flight test by a vertical drop technique at a hypersonic Mach number of 7 p 598 A86-38253
Pivotable strakes for high angle of attack control
|SAE PAPER 851821| p 593 A86-38329
A faster 'transition' to laminar flow
|SAE PAPER 851855| p 548 A86-38347
Effects of wind-tunnel noise on swept-cylinder transition at Mach 3.5
|AIAA PAPER 86-1085| p 550 A86-38447
Laminar boundary layer stability experiments on a cone at Mach 8. IV - On unit Reynolds number and environmental effects
|AIAA PAPER 86-1087| p 550 A86-38449
An experimental study of the aerodynamics of incipient torsional stall flutter
|AIAA PAPER 86-0901| p 553 A86-38912
Aerodynamic characteristics of an oscillating airfoil --- for Vertical Axis Wind Turbine p 616 A86-39566
Wind tunnel test and analysis on gust load alleviation of a high-aspect-ratio wing
|NAL-TR-890| p 556 N86-27185
Vortex Flow Aerodynamics, volume 1
|NASA-CP-2416-VOL-1| p 556 N86-27190
Laser velocimetry in highly three-dimensional and vortical flows p 557 N86-27197
In-flight and wind tunnel leading-edge vortex study on the F-106B airplane p 557 N86-27198
Basic studies on delta wing flow modifications by means of apex fences p 557 N86-27199
Vortex flow hysteresis p 558 N86-27201
Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics
|AGARD-CP-386| p 560 N86-27224
Dynamic stall of swept and unswept oscillating wings
p 560 N86-27228
A critical look at dynamic simulation of viscous flow
p 560 N86-27230
Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing
p 561 N86-27239
New rotary rig at RAE and experiments on HIRM
p 562 N86-27243
New dynamic testing techniques and related results at FFA p 562 N86-27244
Extraction of aerodynamic parameters for aircraft at extreme flight conditions p 563 N86-27248
Dynamic nonlinear airloads: Representation and measurement p 563 N86-27251
Recent experiences of unsteady aerodynamic effects on aircraft flight dynamics at high angle of attack
p 564 N86-27252
Correlation of predicted and free-flight responses near departure conditions of a high incidence research model
p 564 N86-27255
Experimental study of the effect of turbulence on dynamic stalling p 565 N86-27264
Divergence study of a high-aspect ratio, forward-swept wing
|NASA-TM-87682| p 588 N86-27279
Highly Maneuverable Aircraft Technology (HiMAT) flight-flutter test program
|NASA-TM-84907| p 596 N86-27290
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
|AD-A165235| p 599 N86-27295

**WIND TUNNEL WALLS**
Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects
|NASA-TM-87723| p 555 N86-26289

**WIND TUNNELS**
Real-time simulator for helicopter rotor wind-tunnel operations p 596 A86-37179
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
|NASA-CR-177260| p 599 N86-27291

**WIND TURBINES**
Aerodynamic characteristics of an oscillating airfoil --- for Vertical Axis Wind Turbine p 616 A86-39566

**WIND VELOCITY**
Aircraft liftmeter
|NASA-CASE-LAR-12518-1| p 590 N86-27280

**WIND VELOCITY MEASUREMENT**
Windshear detection using a Doppler acoustic sounder (SODAR) p 614 A86-37484
Aircraft liftmeter
|NASA-CASE-LAR-12518-1| p 590 N86-27280

**WING FLAPS**
Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method
|NAL-TM-AE-8507| p 559 N86-27212

**WING FLOW METHOD TESTS**
A three-dimensional boundary-layer method for flow over delta wings with leading-edge separation
|SAE PAPER 851818| p 547 A86-38327
Unsteady vortical flow around three-dimensional lifting surfaces p 553 A86-39052

**WING LOADING**
A unified formulation of rotor load prediction methods
p 576 A86-37774
Transonic aeroelasticity of wings with tip stores
|AIAA PAPER 86-1007| p 553 A86-38948
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|NASA-TM-86798| p 611 N86-26653

**WING OSCILLATIONS**
Vortex-induced bending oscillation of a swept wing
|AIAA PAPER 86-1773| p 542 A86-37809
Three-dimensional unsteady flow fields elicited by a pitching forward swept wing
|AIAA PAPER 86-1104| p 551 A86-38464
A wind tunnel study of active control technology on a high aspect ratio wing
|AIAA PAPER 86-0956| p 594 A86-38930
Flutter of wings with leading edge control surfaces
|AIAA PAPER 86-0897| p 585 A86-38950
Aeroelastic control of oblique-wing aircraft
|NASA-TM-86808| p 595 N86-26340
Recent experiences of unsteady aerodynamic effects on aircraft flight dynamics at high angle of attack
p 564 N86-27252
Correlation of predicted and free-flight responses near departure conditions of a high incidence research model
p 564 N86-27255
Theoretical prediction of wing rocking
p 564 N86-27256

**WING PANELS**
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|AIAA PAPER 86-0976| p 609 A86-38857
Buckling behavior of Rene 41 tubular panels for a hypersonic aircraft wing
|NASA-TM-86798| p 611 N86-26653

**WING PLANFORMS**
Planform effects for low-fineness ratio multibody configurations at supersonic speeds
|AIAA PAPER 86-1799| p 544 A86-37825
Equivalent plate analysis of aircraft wing box structures with general planform geometry
|AIAA PAPER 86-0940| p 583 A86-38837

**WING PROFILES**
Equivalent plate analysis of aircraft wing box structures with general planform geometry
|AIAA PAPER 86-0940| p 583 A86-38837
Wing profile in stalled position subject to a flow of alternating potential and strong vortex
p 560 N86-27229

**WING TIP VORTICES**
Numerical simulation of tip vortices of wings in subsonic and transonic flows
|AIAA PAPER 86-1095| p 550 A86-38456
Visualization of wing tip vortices in unsteady and steady wind
|AIAA PAPER 86-1096| p 551 A86-38457

**WING TIPS**
Wind tunnel test of a model rotor with a free-tip
|AIAA PAPER 86-1781| p 577 A86-37813
Aerodynamic effects of wingtip-mounted propellers and turbines
|AIAA PAPER 86-1802| p 544 A86-37826
Flow structure of lateral wing-tip blowing
|AIAA PAPER 86-1810| p 544 A86-37831
Drag-reduction characteristics of aft-swept wing tips
|AIAA PAPER 86-1824| p 545 A86-37840
Swept wing-tip shapes for low-speed airplanes
|SAE PAPER 851770| p 546 A86-38305
Transonic aeroelasticity of wings with tip stores
|AIAA PAPER 86-1007| p 553 A86-38948
Divergence study of a high-aspect ratio, forward-swept wing
|NASA-TM-87682| p 588 N86-27279

**WINGS**
Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406
Euler calculation for flow over a wing in ground effect
|AIAA PAPER 86-1765| p 542 A86-37803
The use of curved higher order panels for vortex sheet modeling
|AIAA PAPER 86-1812| p 544 A86-37833
Optimization of a supersonic wing by combining linear and Euler methods
|SAE PAPER 851791| p 547 A86-38315
Process for adhesive bonding of metal skins to aircraft structures
|SAE PAPER 851805| p 606 A86-38321
Leading-edge design for improved spin resistance of wings incorporating conventional and advanced airfoils
|SAE PAPER 851816| p 578 A86-38325
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 609 A86-38876
Aeroelastic tailoring of composite wings with external stores
|AIAA PAPER 86-1021| p 609 A86-38878
Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing
p 561 N86-27239

**WORKLOADS (PSYCHOPHYSIOLOGY)**
Some quantitative methodology for cockpit design
p 586 N86-26320

## X

**X WING ROTORS**
X-wing - A low disc-loading V/STOL for the Navy
|SAE PAPER 851772| p 578 A86-38307

**X-29 AIRCRAFT**
The X-29 - A unique and innovative aerodynamic concept
|SAE PAPER 851771| p 546 A86-38306
Classical flight dynamics of a variable forward-sweep-wing aircraft p 594 A86-39043
X-29A technology demonstrator flight test program overview
|NASA-TM-86809| p 586 N86-26328

**XV-15 AIRCRAFT**
Full-scale tilt-rotor hover performance
p 576 A86-37770

## Z

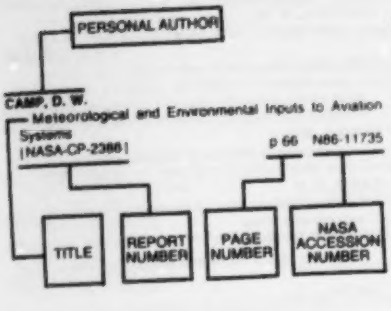
**ZOOM LENSES**
Thermal zoom optics for R.P.V. sensors
p 588 A86-37341

# PERSONAL AUTHOR INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 205)*

October 1986

### Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABID, R.**
Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter
|AIAA PAPER 86-1069| p 548 A86-38436

**ACHYUTHA RAO, A. R.**
F T A - Design considerations for an airframe system and detailed design of fuel subsystem
p 590 A86-37331

**ADCOCK, J. B.**
Tables for correcting airfoil data obtained in the Langley 0.3-meter transonic cryogenic tunnel for sidewall boundary-layer effects
|NASA-TM-87723| p 555 N86-26289

**AGARWAL, R. K.**
Euler calculation for flow over a wing in ground effect
|AIAA PAPER 86-1765| p 542 A86-37803
Euler calculations for flowfield of a helicopter rotor in hover
|AIAA PAPER 86-1782| p 577 A86-37849

**AGARWALA, V. S.**
Electrochemical evaluation of corrosivity in turbine engine oils
|SAE PAPER 851867| p 602 A86-38534

**AHMED, A.**
Further results of natural laminar flow flight test experiments
|SAE PAPER 850862| p 581 A86-38504

**AHOPELTO, E.**
Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 600 A86-38876

**AKER, S. C.**
Process for adhesive bonding of metal skins to aircraft structures
|SAE PAPER 851805| p 606 A86-38321

**ALAG, G. S.**
Decoupling control synthesis for an oblique-wing aircraft
|NASA-TM-86801| p 595 N86-26339
Aeroelastic control of oblique-wing aircraft
|NASA-TM-86808| p 595 N86-26340

**ALELXANDER, D. R.**
Comparative study of nondestructive pavement testing. WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
|AD-A163379| p 610 N86-26480

**ALFARO-BOU, E.**
NASA experiments onboard the controlled impact demonstration
|SAE PAPER 851885| p 568 A86-38352

**ALLEE, E. G., JR.**
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Suppon (CTS) system
|AD-A165235| p 599 N86-27295

**ALLEN, D. W.**
High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329

**ALLEN, M. G.**
Use of the flight simulator in performing AFTI/F-16 airplane aeroservoelastic analysis
|AIAA PAPER 86-0957| p 585 A86-38931

**ANDERSON, J. R.**
Evaluation of the ASR-9 weather reflectivity product
p 614 A86-37485

**ARCHAMBAUD, J. P.**
Instrumentation and testing techniques in the T2 transonic cryogenic wind tunnel at the ONERA/CERT
p 597 A86-38228

**ARIELI, R.**
Computation of transonic flow about helicopter rotor blades p 554 A86-39053

**ASHFORD, R.**

Installation of a bleed air heated radome/air motion sensing system on a Beech King Air 200 aircraft
[SAE PAPER 851811] p 589 A86-38322

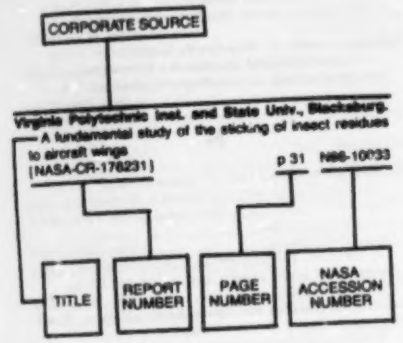
**ZUMWALT, G. W.**
Analyses and tests for design of an electro-impulse de-icing system
[NASA-CR-174919] p 571 N86-27268
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
[NASA-CR-177260] p 599 N86-27291

# CORPORATE SOURCE INDEX

October 1986

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 205)*

### Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations
[AGARD-CP-387] p 573 N86-26316
Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization: mission impossible?
[AGARD-R-723-ADD-1] p 556 N86-27187
Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics

Aerospace knowledge magazine (selected articles)
[AD-A164720] p 539 N86-26278

**Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.**
Evaluation of the effects of a plastic bead paint removal process on properties of aircraft structural materials
[AD-A165289] p 603 N86-26384
Steady supersonic Navier-Stokes solutions of a 75 deg delta wing p 558 N86-27206
Unsteady aerodynamics and dynamic aircraft maneuverability p 564 N86-27253

**AiResearch Casting Co., Torrance, Calif.**
Fabrication of ceramic components for advanced gas turbine engines
[SAE PAPER 851786] p 606 A86-38310
Processing study of injection molding of silicon nitride for engine applications
[SAE PAPER 851787] p 606 A86-38311

**Analytical Mechanics Associates, Inc., Mountain View, Calif.**
Fuel conservative guidance for shipboard landing of powered-lift STOL aircraft p 572 A86-39048

**Army Aviation Research and Development Command, Hampton, Va.**
Crash energy absorbing composite sub-floor structure
[AIAA PAPER 86-0944] p 585 A86-38952

**Army Aviation Systems Command, Moffett Field, Calif.**
Effects of simulator variations on the fidelity of a UH-60 Black Hawk simulation p 596 A86-37178
Calculation of helicopter airfoil characteristics for high tip-speed applications p 541 A86-37769
Numerical simulation of tip vortices of wings in subsonic and transonic flows
[AIAA PAPER 86-1095] p 550 A86-38456

**Army Command and General Staff Coll., Fort Leavenworth, Kansas.**
The C-17: An attempt at increased airlift versatility
[AD-A164822] p 540 N86-26280

**Army Engineer Waterways Experiment Station, Vicksburg, Miss.**
Comparative study of nondestructive pavement testing. WES (Waterways Experiment Station) NDT (nondestructive tests) methodologies
[AD-A163379] p 610 N86-26480

**Arnold Engineering Development Center, Arnold Air Force Station, Tenn.**
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
[AD-A165235] p 599 N86-27295

## B

**Boeing Aerospace Co., Seattle, Wash.**
Experiments on supersonic turbulent flow development in a square duct
[AIAA PAPER 86-1038] p 548 A86-38412

**Boeing Commercial Airplane Co., Seattle, Wash.**
Structural analysis of the controlled impact demonstration of a jet transport airplane
[AIAA PAPER 86-0939] p 583 A86-38836

**Boeing Military Airplane Development, Seattle, Wash.**
Viscous vortical flow calculations over delta wings p 558 N86-27202

**Boeing Vertol Co., Philadelphia, Pa.**
Wind tunnel test of a model rotor with a free-tip
[AIAA PAPER 86-1781] p 577 A86-37813

## C

**California Polytechnic State Univ., San Luis Obispo.**
Harrier III-AV8B with a modern engine
[SAE PAPER 851881] p 579 A86-38349

**California Univ., Davis.**
Drag-reduction characteristics of aft-swept wing tips
[AIAA PAPER 86-1824] p 545 A86-37840

**California Univ., Los Angeles.**
A new approach to finite state modelling of unsteady aerodynamics
[AIAA PAPER 86-0865] p 552 A86-38900

**Calspan Advanced Technology Center, Buffalo, N.Y.**
An evaluation of the capability of the surface condition analyzer (SCAN) sensors to measure runway water depth
[AD-A164719] p 611 N86-26603

**Calspan Field Services, Inc., Arnold AFS, Tenn.**
Verification and aerodynamic calibration of the tunnel 16T Captive Trajectory Support (CTS) system
[AD-A165235] p 599 N86-27295

**Centre National de la Recherche Scientifique, Marseilles (France).**
Wing profile in stalled position subject to a flow of alternating potential and strong vortex p 560 N86-27229

**Cessna Aircraft Co., Wichita, Kans.**
Further results of natural laminar flow flight test experiments
[SAE PAPER 850862] p 581 A86-38504

**College of William and Mary, Williamsburg, Va.**
A high-order language dor a system of closely coupled processing elements
[NASA-CR-177280] p 619 N86-27930

**Columbia Univ., New York.**
Noise transmission into propeller aircraft p 619 N86-27473

**Coordinating Research Council, Inc., Atlanta, Ga.**
Flammability of aircraft hydraulic fluids: A bibliography
[AD-A165463] p 569 N86-26299

**Virginia Polytechnic Inst. and State Univ., Blacksburg.**

Linear dynamic coupling in geared rotor systems
[ASME PAPER 85-DET-11] p 608 A86-38617

Application of the unsteady vortex-lattice method to the nonlinear two-degree-of-freedom aeroelastic equations
[AIAA PAPER 86-0867] p 585 A86-38902

Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176840] p 610 N86-26546

**Vrije Universiteit, Brussels (Belgium).**

Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil
p 560 N86-27228

## W

**Washington Univ., Seattle.**

Experiments on supersonic turbulent flow development in a square duct
[AIAA PAPER 86-1038] p 548 A86-38412

Use of NDE to evaluate reflection cracking in airfield pavements
[AD-A164880] p 599 N86-27293

**Wear Sciences, Inc., Arnold, Md.**

High-temperature lubrication systems for ring/liner applications in advanced heat engines
[AD-A164955] p 604 N86-26446

**Westland Helicopters Ltd., Yeovil (England).**

Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241

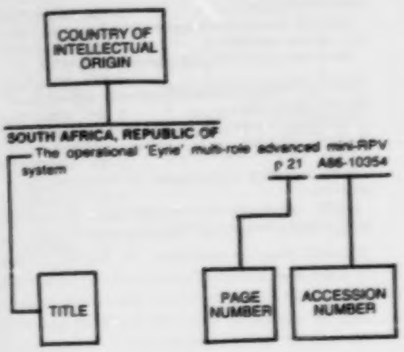
**Wichita State Univ., Kans.**
The use of curved higher order panels for vortex sheet modeling
[AIAA PAPER 86-1812] p 544 A86-37833
Further results of natural laminar flow flight test experiments
[SAE PAPER 850862] p 581 A86-38504
Analyses and tests for design of an electro-impulse de-icing system
[NASA-CR-174919] p 571 N86-27268
De-icing of the altitude wind tunnel turning vanes by electro-magnetic impulse
[NASA-CR-177260] p 599 N86-27291
**Woodrow Wilson International Center for Scholars, Washington, D.C.**
The effects on rotor nonuniform inflow harmonic content of uneven circumferential distribution of jet engine inlet guide vanes
[AD-A164629] p 555 N86-26291

# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 205)*

October 1986

## Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system
p 21
A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

**Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.**

## A

**AUSTRALIA**

The General Electric F404 - engine of the RAAF's new fighter
|AD-A164562| p 592 N86-26338

## B

**BELGIUM**

Velocity and turbulence measurements in dynamically stalled boundary layers on an oscillating airfoil p 560 N86-27228

**BRAZIL**

The EMB-312 Tucano - A Brazilian trainer
|SAE PAPER 851789| p 578 A86-38304

## C

**CANADA**

Canadair rotary wing, full scale engineering development. III p 575 A86-37330

Wing and conical body of arbitrary cross-section combinations in supersonic flow
|AIAA PAPER 86-1826| p 545 A86-37841

Instrumentation and other issues in non-linear dynamic testing in wind tunnels p 597 A86-38248

Developments in airworthiness control for Canadian airlines
|SAE PAPER 851784| p 620 A86-38308

Fine structure of subsonic jet noise p 619 A86-39069

Research on the technology of an airplane concept for a Stationary High-Altitude Relay Platform (SHARP) p 586 A86-39564

Low airspeed envelope determination of the CH-139 Jet Ranger helicopter p 586 A86-39565

Aerodynamic characteristics of an oscillating airfoil p 616 A86-39566

Next generation aircraft structures - The need for co-ordinated Canadian R & D programs p 539 A86-39567

Surge margin enhancement by a porous throat diffuser p 592 A86-39568

Cost-effective remote-site testing p 539 A86-39570

Dynamic nonlinear airloads: Representation and measurement p 563 N86-27251

Experimental study of the effect of turbulence on dynamic stalling p 565 N86-27264

Flight simulation motion-base drive algorithms. Part 2: Selecting the system parameters
|UTIAS-307| p 618 N86-27929

Spectra of noise and amplified turbulence emanating from shock-turbulence interaction: Two scenarios
|NASA-TM-88766| p 620 N86-27970

**CHINA, PEOPLE'S REPUBLIC OF**

The development of Z-2 Remotely Piloted Helicopter p 575 A86-37328

Vibration test and identification of modal parameter of aircraft wing model p 605 A86-37406

Design features of automatic control system of D-4 RPV p 593 A86-37407

An investigation of improving high angle of attack performance and flap effectiveness of a configuration with delta wing by spanwise blowing
|AIAA PAPER 86-1777| p 542 A86-37811

A mathematical model for calculation of effects of air humidity fuel composition and gas dissociation on engine performance and its actual application p 591 A86-38994

Temperature distribution investigation at the outlet of an annular combustor of P type turbojet engine p 591 A86-38998

Recurrent identification of unsteady aerodynamic forces of elastic vehicles p 554 A86-39762

Six-force-factor identification of helicopters p 586 A86-39763

An terrain-aided guidance system with high convergence speed p 573 A86-39766

The equivalent deterministic function of the Dryden's spectra of atmospheric turbulence and its application to the aircraft response problem p 595 A86-39768

Aerospace knowledge magazine (selected articles)
|AD-A164720| p 539 N86-26278

## F

**FINLAND**

Application of low temperature curing prepregs and vacuum bag molding techniques to the manufacturing of a composite wing
|AIAA PAPER 86-1019| p 609 A86-38876

**FRANCE**

Decoupling of nonlinear systems, noncommutative generatrix series, and Lie algebras p 618 A86-37395

The hazards of ash clouds to civil air transport p 566 A86-37477

Windshear detection using a Doppler acoustic sounder (SODAR) p 614 A86-37484

Instrumentation and testing techniques in the T2 transonic cryogenic wind tunnel at the ONERA/CERT p 597 A86-38228

Aircraft ground support equipment standardization - The pros and cons of 'functional' vs 'technical' standardization
|SAE PAPER 851794| p 620 A86-38317

Experimental study of a turbulent horseshoe vortex using a three-component laser velocimeter
|AIAA PAPER 86-1069| p 548 A86-38436

Off-design operation of turbomachines p 591 A86-38956

MLS - The pilot's point of view p 572 A86-39557

Air traffic control (ATC) and vessel traffic systems (VTS) p 572 A86-39558

A minimum route time (MRT) program for microcomputers p 572 A86-39561

The presence of the Trident III on Antarctica p 573 A86-39562

Guidance-Control-Navigation Automation for Night All-Weather Tactical Operations
|AGARD-CP-387| p 573 N86-26316

Synthetic real-time relief display all-weather airborne missions p 589 N86-26321

Use of a CO2 laser lidar for flight and penetration at very low altitudes p 610 N86-26326

A mission navigation and control system for modern military helicopters p 574 N86-26327

Aircraft drag prediction and reduction. Addendum 1: Computational drag analyses and minimization; mission impossible?
|AGARD-R-723-ADD-1| p 556 N86-27187

La recherche aerospatiale. Bimonthly bulletin, no. 1984-6, November - December 1984
|ESA-TT-907| p 559 N86-27217

A vortex point method for calculating inviscid incompressible flows around rotary wings p 612 N86-27219

Dynamic stall modeling of the NACA 0012 profile p 559 N86-27222

Helicopter noise p 560 N86-27223

Unsteady Aerodynamics-Fundamentals and Applications to Aircraft Dynamics
|AGARD-CP-386| p 560 N86-27224

Wing profile in stalled position subject to a flow of alternating potential and strong vortex p 560 N86-27229

Recent developments in techniques for dynamic simulation for the identification of stability parameters p 562 N86-27246

Study of the transition behavior of an airplane in the vicinity of bifurcation points p 566 N86-27266

Operational flight experience and disassembly/inspection results of Space Shuttle orbiter actuators p 600 N86-27354

Impact damage to composite structures
|AGARD-R-729| p 604 N86-27425

Static aeroelasticity in combat aircraft
|AGARD-R-725| p 613 N86-27678

## G

**GERMANY,FEDERAL REPUBLIC OF**

Aerodynamics and radar-signature - A theoretical approach to estimate the radar-signature of complex aircraft configurations compatible with aerodynamic panel-methods
|AIAA PAPER 86-1770| p 577 A86-37807

Alpha Jet Training System single aircraft concept
|SAE PAPER 851766| p 598 A86-38301

Influence of FBW - Control laws on structural design of modern transport aircraft
|AIAA PAPER 86-0953| p 584 A86-38846

Dynamic interactions between active control systems and a flexible aircraft structure
|AIAA PAPER 86-0960| p 594 A86-38932

Experimental and theoretical study of the effect of wave propagation on the positional accuracy of Omega navigation in Germany p 572 A86-38974

FLIR, NVG and HMS/D systems for helicopter operation. Review p 619 N86-26804

Unsteady boundary-layer separation on airfoils performing large-amplitude oscillations. Dynamic stall p 561 N86-27231

Wind tunnel and flight test analysis and evaluation of the buffet phenomena for the alpha jet transonic wing p 561 N86-27239

Unsteady vortex airfoil interaction p 562 N86-27240

Standard dynamics model experiments with the DFVLR/AVA transonic derivative balance p 562 N86-27245

Generation of two-dimensional gust fields in subsonic wind-tunnels p 563 N86-27247

Gust alleviation on a transport airplane p 565 N86-27259

Identification of aircraft characteristics including gust induced dynamic effects p 565 N86-27263

Improvement of strapdown system performance by means of numerical methods
|BMFT-FB-W-85-011| p 575 N86-27275

Development, construction, and manufacturing of wind tunnel models for aerodynamic investigations
|BMFT-FB-W-85-012| p 600 N86-27296

**GREECE**

Modelling of the vortex-airfoil interaction
p 565 N86-27262

## I

**INDIA**

P T A - Design considerations for an airframe system and detailed design of fuel subsystem
p 590 A86-37331

Analysis of wings with leading edge and/or trailing edge segmented (spanwise) flaps using planar horse shoe vortex lattice method
|NAL-TM-AE-8507| p 559 N86-27212

A computer programme for DATCOM methods of estimation of lateral stability and control derivatives
|NAL-TM-AE-8601| p 596 N86-27289

**ITALY**

Meteosat-derived quantitative measurements on volcanic ash plumes for warning to aviation
p 566 A86-37478

Radar data processing. Volume 2 - Advanced topics and applications p 605 A86-38224

## J

**JAPAN**

Aerodynamic characteristics of a circulation controlled symmetrical airfoil with dual jet p 541 A86-37196

The external drag of a simple axisymmetric body of revolution in subsonic and supersonic flow with variable mass flowthrough ratios
|AIAA PAPER 86-1828| p 545 A86-37842

Spreading of two-stream supersonic turbulent mixing layers p 546 A86-37901

Wind tunnel free-flight test by a vertical drop technique at a hypersonic Mach number of 7 p 598 A86-38253

A calculation method for unsteady aerodynamic forces in the Laplace domain and its application to root loci
|AIAA PAPER 86-0866| p 553 A86-38901

A wind tunnel study of active control technology on a high aspect ratio wing
|AIAA PAPER 86-0956| p 594 A86-38930

Computation of 3-dimensional viscous transonic flows using the LU-ADI factored scheme
|NAL-TR-889T| p 555 N86-27184

Wind tunnel test and analysis on gust load alleviation of a high-aspect-ratio wing
|NAL-TR-890| p 556 N86-27185

An analysis of the limit cycle observed in the functional mockup test of the NAL QSTOL research aircraft
|NAL-TR-893| p 587 N86-27277

## N

**NETHERLANDS**

The influence of esters on elastomer seals
|SAE PAPER 851868| p 602 A86-38535

Laminar and turbulent boundary-layer calculations on the leeward surface of a slender delta wing at incidence
|NLR-MP-84040-U| p 555 N86-26293

Method for determining the time delay of the pitot-static tubing system of aircraft
|NLR-TR-83075-U| p 589 N86-26335

Failures in advanced flight control systems of future transport aircraft
|NLR-TR-84108-U| p 595 N86-26343

Engineering property comparisons for 2324-T39 and 2024-T351 aluminum alloy plate
|NLR-TR-84021-U| p 603 N86-26429

Effects of cladding and anodizing on flight simulation fatigue of 2024-T3 and 7475-T761 aluminum alloys
|NLR-TR-85006-U| p 604 N86-26430

The postbuckling behavior of blade-stiffened carbon epoxy panels loaded in compression
|NLR-MP-85019-U| p 611 N86-26661

Some tests to assess the effect of crack stoppers on the fatigue life of center-notched specimens
|NLR-TR-84051-U| p 611 N86-26662

Constant amplitude and flight simulation of fatigue tests on adhesive bonded lap joint specimens of 2024-T3 sheet material
|NLR-TR-84090-U| p 612 N86-26663

An efficient decision-making-free filter for processes with abrupt changes
|NLR-MP-84080-U| p 618 N86-27018

Unsteady airload computations for airfoil oscillating in attached and separated compressible flow
p 561 N86-27238

Effects of aerodynamic lags on aircraft responses
p 564 N86-27257

Principles and applications of the Fokker bond tester
|ESA-86-96960| p 612 N86-27624

## P

**POLAND**

Gas and erosion corrosion of the combustion chambers of aircraft engines p 592 A86-39725

## S

**SOUTH AFRICA, REPUBLIC OF**

A hot air tunnel for base bleed experimentation
p 597 A86-38252

**SWEDEN**

Flight test with a terrain aided navigation system
p 571 A86-37334

New dynamic testing techniques and related results at FFA p 562 N86-27244

**SWITZERLAND**

How US companies are attacking production costs
p 605 A86-37323

## T

**TAIWAN**

The dynamic instability of plate structures
p 605 A86-37348

## U

**U.S.S.R.**

Heat transfer and drag of a body in the far supersonic wake p 554 A86-39657

Lifting bodies designed for flow behind axisymmetric conical shock waves p 554 A86-39660

Characteristics of synthetic aperture radars
p 610 A86-39683

Processes for the manufacture of aviation instrument components (2nd revised and enlarged edition)
p 610 A86-39979

Investigations in the history and theory of the development of aviation and space science and technology. Number 4 p 620 A86-39984

**UNITED KINGDOM**

Remotely piloted vehicles; International Conference, 5th, Bristol, England, September 9-11, 1985, Proceedings and Supplementary Papers p 575 A86-37326

The risk to third party personnel from RPV operations
p 566 A86-37327

High altitude unmanned aircraft for meteorological applications - HIMET p 575 A86-37329

A thermal imaging payload for RPV applications
p 588 A86-37333

A real-time simulation of a non-linear RPV incorporating head-up type colour graphics p 593 A86-37335

Ground control station for RPVs p 571 A86-37336

A new compressed air launching system
p 596 A86-37337

The Phoenix air vehicle, its launch and recovery
p 576 A86-37340

Thermal zoom optics for R.P.V. sensors
p 588 A86-37341

The Phoenix sensor turret system
p 588 A86-37342

Applications of sensor payloads p 588 A86-37343

'A flywheel powered RPV launcher - Putting theory into practice' p 590 A86-37344

A spring in the air p 590 A86-37345

A unified formulation of rotor load prediction methods
p 576 A86-37774

Three-dimensional interaction of wakes and boundary layers
|AIAA PAPER 86-1820| p 545 A86-37838

EAP - Fighter blueprint p 577 A86-37939

Putting a price on safety p 567 A86-37940

Aviation fuels technology p 601 A86-38266

Hawk - The British fighting trainer
|SAE PAPER 851768| p 578 A86-38303

European aircraft steering systems
|SAE PAPER 851940| p 581 A86-38373

The interaction between a strong longitudinal vortex and a turbulent boundary layer
|AIAA PAPER 86-1071| p 549 A86-38437

Some aspects of fluorocarbon elastomer compatibility with gas turbine lubricants
|SAE PAPER 851799| p 601 A86-38529

Deposition in gas turbine oil systems. I - Analysis and classification
|SAE PAPER 851869| p 602 A86-38536

The influence of JFTOT operating parameters on the assessment of fuel thermal stability
|SAE PAPER 851871| p 602 A86-38538

Evaluation of JFTOT tube deposits by carbon burnoff
|SAE PAPER 851994| p 602 A86-38539

Time runs out for the clockwork cockpit
p 583 A86-38701

Aircraft wheel design and proving p 583 A86-38721

A unified procedure for meeting power-spectral-density and statistical-discrete-gust requirements for flight in turbulence
|AIAA PAPER 86-1011| p 584 A86-38869

The indirect boundary integral formulation for elliptic, hyperbolic and non-linear fluid flows
p 553 A86-38971

A solid-state map display for rapid response operation
p 589 N86-26323

Night vision by NVG with FLIR p 619 N86-26811

Unsteady aerodynamics-fundamentals and applications to aircraft dynamics
|NASA-TM-88768| p 555 N86-27182

Unsteady aerodynamics application to helicopter noise and vibration sources p 562 N86-27241

New rotary rig at RAE and experiments on HIRM
p 562 N86-27243

On the interface between unsteady aerodynamics, dynamics and control p 564 N86-27254

Correlation of predicted and free-flight responses near departure conditions of a high incidence research model
p 564 N86-27255

A self-organising control system for non-linear aircraft dynamics p 564 N86-27258

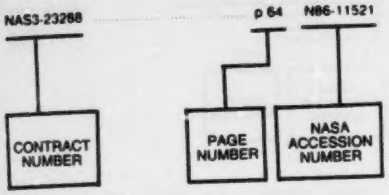
Design, development and operation of a high simultaneous capacity digital telemetry system
p 613 N86-27632

# CONTRACT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 205)*

October 1986

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

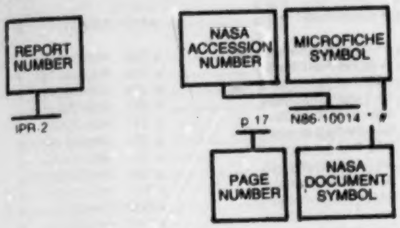
# REPORT NUMBER INDEX

### Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

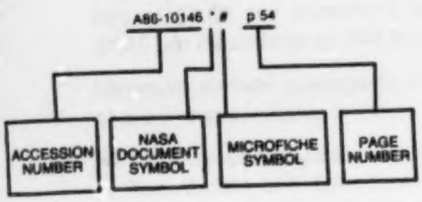
# ACCESSION NUMBER INDEX

AERONAUTICAL ENGINEERING / *A Continuing Bibliography (Supplement 205)*

October 1986

**Typical Accession Number Index Listing**



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

## FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A06.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 422 reports, journal articles and other documents originally announced in October 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cummulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 621

**Category 02 Aerodynamics** 623
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 633
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 635
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 637
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 641
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 642
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 651
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 655
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 658
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communicatons, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 659
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 667

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 678

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 679

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and computer Sciences** 679

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 682

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 684

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** N.A.

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

**HEALTH AND USAGE MONITORING TECHNIQUES FOR GREATER SAFETY IN HELICOPTER OPERATIONS**

D. G. ASTRIDGE International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Sept. 1985, p. 205-211. refs

Significant advancements have recently been made in helicopter gearbox monitoring technology, notably in quantitative debris monitoring (QDM) and enhanced vibration signal averaging. Attention is given to a QDM system that has demonstrated its effectiveness against a wide range of wear modes, and to vibration analysis techniques that have detected cracks and fracture modes not yet detectable by visual inspection. A comprehensive onboard monitoring system has been developed which incorporates, in addition to the two techniques mentioned, engine and rotor system monitoring elements. O.C.

**SIMULATOR UPGRADE - REGULATIONS AND BENEFITS**

E. M. BOOTHE (FAA, Atlanta, GA) IN: Simulators; Proceedings of the Conference, Norfolk, VA, March 3-8, 1985 . La Jolla, CA, Society for Computer Simulation, 1985, p. 6-12. refs

In June of 1980, the Federal Aviation Administration (FAA) Advanced Simulation Plan came into being. Since that time, there has been a significant increase in the use of Advanced Simulators in lieu of the aircraft for training and checking of pilots. It is pointed out that new advanced simulators are now coming into operation, allowing nearly 100 percent of the pilot's training and checking to be accomplished in the simulator. Attention is given to the Advanced Simulator Plan with its three phases, the National Simulation Evaluation Program, progress which has been made, regional air carriers and general aviation, and an investigation of alternatives. **EXPERIENCES IN UK AND FRANCE IN AEROSPACE APPLICATION**

B. J. HAYES (Ciba-Geigy Plastics and Additives Co., Duxford, England) IN: Carbon fibres and their composites . Berlin and New York, Springer-Verlag, 1985, p. 229-240.

A development history is presented for British and French involvement in the design and production of high performance glass and carbon fiber-reinforced composite structures for aircraft, spacecraft, and helicopters. Propulsion-related applications of such composites have encompassed not only the familiar helicopter rotor blades and driveshaft torque-tubes, but commercial aircraft propeller blades and even CFRP fan blades (which failed due to poor impact performance). Future avenues of development in this field are projected. O.C.

**WHICH TRANSPORT TECHNOLOGIES WILL FLY?**

J. M. SWIHART (Boeing Co., Seattle, WA) Aerospace America (ISSN 0740-722X), vol. 24, May 1986, p. 56-58.

The cost of ownership of commercial aircraft is seen as a factor that will limit which new technologies will be adopted. Today, for a 10 percent fuel saving, an airline can bear a premium of only 2.5 percent. Thus, some technologies that look promising technically will not pay off big enough to fly. Technologies that can be expected to pay off include: using computers to design improved wings; lighter materials such as aluminum-lithium alloys and composites (if labor and material costs for composite structures are not too great); computer-aided design/computer-aided manufacturing; microprocessor technology; fiber optics (to potentially reduce the heavy electromagnetic shielding required for electronics); and improved engines such as the counterrotating pusher turboprop. Fly-by-wire and fly-by-light systems, which might replace mechanical cable controlled flight systems, need to be studied further. Various of these technologies in combination may within a decade make possible a transport delivering over 150 seat-miles per gallon. Such an airliner would make most of today's aircraft obsolete - if the cost of ownership can be kept down. D.H.

**BRINGING ON THE B-1B**

J. P. COYNE Air Force Magazine (ISSN 0730-6784), vol. 69, June 1986, p. 63-69.

An account is given of the first year of B-1B bomber training operations at Dyess Air Force Base, Texas. The training schedule calls for the qualification of 250 pilots for four SAC B-1B operational wings by 1990, complemented by 300 copilots and 500 systems officers. Because the B-1B is so heavily dependent on computers and electronics, intensive avionics training is included in the Dyess program. Attention is given to such automated maintenance systems as the Central Integrated Test System and the Automated Tech Order System. O.C.

**DELIVERY OF B-1B CHANGES MAINTENANCE PROCEDURES**

Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 2, 1986, p. 60-62.

An evaluation is made of the consequences for maintenance procedures of the B-1B bomber's incorporation of a number of revolutionary monitoring and diagnostics systems. These encompass (1) a Central Integrated Test System dedicated to maintenance diagnostics; (2) the Core Automated Maintenance System, which will substitute electronic mail for the paperwork conventionally used in maintenance; and (3) the Consolidated Aircraft Support System, which allows an aircraft to be serviced on the ramp without need for additional ground equipment to supply air cooling, water, electricity, jet fuel, and communication lines. O.C.

**A TIME-BASED CONCEPT FOR TERMINAL-AREA TRAFFIC MANAGEMENT**
.I. ERZBERGER and L. TOBIAS Apr. 1986 17 p Presented at the 42nd AGARD Guidance and Control Panel Symposium, Brussels, Belgium, 6-9 May, 1985
(NASA-TM-88243; NAS 1.15:88243) Avail: NTIS HC A02/MF A01 CSCL 01B

An automated air-traffic-management concept that has the potential for significantly increasing the efficiency of traffic flows in high-density terminal areas is discussed. The concept's implementation depends on the techniques for controlling the landing time of all aircraft entering the terminal area, both those that are equipped with on-board four dimensional guidance systems as well as those aircraft types that are conventionally equipped. The two major ground-based elements of the system are a scheduler which assigns conflict-free landing times and a profile descent advisor. Landing times provided by the scheduler are uplinked to equipped aircraft and translated into the appropriate four dimensional trajectory by the on-board flight-management system. The controller issues descent advisories to unequipped aircraft to help them achieve the assigned landing times. Air traffic control simulations have established that the concept provides an efficient method for controlling various mixes of four dimensional-equipped and unequipped, as well as low-and high-performance, aircraft. Recent advances in computing power and numerical solution procedures have enabled computational fluid dynamicists to attempt increasingly difficult problems. In particular, efforts are focusing on computations of complex three-dimensional flow fields about realistic aerodynamic bodies. To perform such computations, a very accurate and detailed description of the surface geometry must be provided, and a three-dimensional grid must be generated in the space around the body. The geometry must be supplied in a format compatible with the grid generation requirements, and must be verified to be free of inconsistencies. This paper presents a procedure for performing the geometry definition of a fighter aircraft that makes use of a commercial computer-aided design/computer-aided manufacturing system. Furthermore, visual representations of the geometry are generated using a computer graphics system for verification of the body definition. Finally, the three-dimensional grids for fighter-like aircraft are generated by means of an efficient new parabolic grid generation method. This method exhibits good control of grid quality. Author

**DEVELOPMENT OF A PORTABLE WEAR METAL ANALYZER FOR FIELD USE Final Report, Aug. 1982 - Aug. 1985**
W. NIU Aug. 1985 115 p
(Contract F33615-81-C-2080)
(AD-A166013; AFWAL-TR-85-2043) Avail: NTIS HC A06/MF A01 CSCL 07D

The portable wear metal analyzer (PWMA) was developed to perform engine oil analysis when aircraft are deployed away from their home bases. The analyzer can detect nine wear metals in the parts per million concentration ranges. The analyzer uses the graphite furnace atomic absorption technology with a specially developed multi-element analysis scheme. The overall system is packaged into two militarized suitcases, including a nine-channel spectrometer, an air or water-cooled graphite furnace, a miniaturized graphite furnace power supply, a unique sample introduction device, a pneumatic supply system, and microprocessor controlled electronics. The analyzer is simple to set up and use. The operator only needs to introduce an undiluted oil sample, push a start button and wait for the results to be printed out. A brassboard system was first developed followed by six prototypes. Analytical performance as well as environmental compatibility were thoroughly evaluated on the first prototype. Consequently, design improvements were made and incorporated into five subsequent prototypes. Test results of the prototypes indicated that the instruments can meet the oil analysis need in both laboratory and rugged environments. Field tests are under way and the results will further verify the validity of the instruments. GRA

An interview is presented with the designers of a new cargo aircraft. They state that the appearance of the An-22 (Antey) winged heavyweight, capable of carrying 80 tons of different cargo, became a sensation 20 years ago. Created on the same drawing board as the Antey, the Ruslan has a cargo capacity which is almost double that of its older brother 5. It has already scored 21 world records, including carrying a load of 171.2 tons to an altitude of 10,700 meters. The designers are further questioned about the basic features, advantages, weight reduction, engine type, maintenance, and flight safety. E.R.

**INDICIAL COEFFICIENTS FOR A CROPPED DELTA WING IN INCOMPRESSIBLE FLOW**
V. J. E. STARK (Saab Scania AB, Linkoping, Sweden) Journal of Aircraft (ISSN 0021-8669), vol. 23, May 1986, p. 370-375. Research supported by the Swedish Defence Administration and Saab Scania AB. refs

Indicial coefficients and corresponding deficiency functions have been calculated for typical deflection modes of a cropped delta wing with trailing-edge flaps in incompressible flow by an approximate doublet element method for arbitrary motion. The normalized deficiency functions for the modes considered were found to be closely approximated by a single one-parameter function. The parameter, a characteristic time, was found to have the same value for this wing as for a rectangular wing of aspect ratio 3 when referred to semispan divided by freestream speed. Laplace transformation of the one-parameter function yields a generalized Theodorsen function. Author

**EULER SOLUTIONS FOR AIRFOIL/JET/GROUND-INTERACTION FLOWFIELDS**
R. K. AGARWAL and J. E. DEESE (McDonnell Douglas Research Laboratories, St. Louis, MO) Journal of Aircraft (ISSN 0021-8669), vol. 23, May 1986, p. 376-381. refs

Airfoil/jet/ground-interaction flowfields are calculated by solving Euler equations on body-conforming curvilinear grids. For these computations, Jameson's Euler code (FLO-53) based on an explicit Runge-Kutta time-marching finite-volume procedure is modified. Euler equations are preconditioned for computing almost incompressible flows. Euler equations capture the vortex formation behind the jet and most of the airfoil/jet/ground-plane interaction, except the effect of entrainment. Reasonable agreement is obtained between the calculated and experimental values of the lift on the airfoil for moderate values of jet-velocity to freestream-velocity ratio. Author

**MEASURED AND PREDICTED HEATING DISTRIBUTIONS FOR BICONICS AT MACH 10**

C. G. MILLER, P. A. GNOFFO, and S. E. WILDER (NASA, Langley Research Center, Hampton, VA) Journal of Spacecraft and Rockets (ISSN 0022-4650), vol. 23, May-June 1986, p. 251-258. refs

Laminar heating distributions have been measured on a 1.9 percent scale model of a generic aeroassisted vehicle taking the shape of a spherically blunted, 13-deg/7-deg biconic whose forecone section is bent upward (by 7 deg) to furnish self-trim capability at a 20-deg angle-of-attack. The results thus obtained were compared with data gathered for a straight biconic. While no Reynolds number effect on heating was noted on the windward side of the forecone, the opposite was true of the leeward side, where a Reynolds number increase caused circumferential flow separation at lower angles of attack. Generally, windward heating was predicted to within 10 percent with a computer code solving the steady, three-dimensional parabolized Navier-Stokes equations. O.C.

**EXPERIMENTAL INVESTIGATION OF THE TURBULENT BOUNDARY LAYER AT HIGH REYNOLDS NUMBERS AND A MACH NUMBER OF 0.8**

L. GAUDET (Royal Aircraft Establishment, Bedford, England) Aeronautical Journal (ISSN 0001-9240), vol. 90, March 1986, p. 83-94. refs

Measurements of the turbulent boundary layer on a sidewall of the RAE 8 ft x 8 ft wind tunnel are described. Velocity profiles and wall shear-stress measurements were obtained for a Mach number of 0.8 over a Reynolds number range of over a decade up to a value of nearly 400 million. A skin-friction relationship is deduced together with a description of the velocity profile and boundary-layer growth based upon the velocity-defect law using kinematic parameters for constant-pressure flows without heat transfer. Previous data for Mach numbers up to 2.8 obtained in the same tunnel are shown to be well matched with the present analysis and the use of simple scaling factors for compressible flows is confirmed. Author

**NUMERICAL STUDY OF THE TRAILING EDGE REGION IN SLIP FLOW REGIME**

L. GOTTESDIENER (Paris VI, Universite, Meudon, France) IN: Rarefied gas dynamics. Volume 1 . New York, Plenum Press, 1985, p. 523-533. refs

The supersonic rarefied flow over a finite flat plate has been computed using a finite-difference solution of the complete unsteady Navier-Stokes equations. The solution is advanced in time from the initial conditions until the steady state solution is reached. The computational region extends from the free stream ahead of the plate to the near wake. Both wall slip and temperature jump are included in the calculations. The results compare favorably with experimental data, but some deviations are noted in the trailing edge region. Particularly the local shear stress coefficient increases approaching the trailing edge. This result gives reinforcement of the Triple Deck Theory. Author

**COMPUTATION OF TWO-DIMENSIONAL TRANSONIC CASCADE FLOW USING A NEW NAVIER-STOKES SOLVER**

N. SATOFUKA, K. MORINISHI (Kyoto Institute of Technology, Japan), T. TAMAKI, and A. SHIMIZU (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs

(AIAA PAPER 86-1381)

A new explicit method for calculating viscous flows in turbomachinery cascades has been developed. The thin-layer Navier-Stokes equations are solved by using the rational Runge-Kutta time stepping procedure of Wambecq (1978) combined with the usual central finite difference approximations. The Baldwin-Lomax (1978) eddy-viscosity model is used for turbulent flows. Convergence to a steady state is accelerated by use of the local time stepping and the residual averaging techniques. Details of the numerical method are presented along with computed result for two transonic cascades. Results are compared with experimental data to demonstrate the accuracy and computational efficiency of the present method. Author

**STUDY OF HYPERSONIC INLET FLOW FIELDS WITH A THREE-DIMENSIONAL NAVIER-STOKES CODE**

A. KUMAR and G. Y. ANDERSON (NASA, Langley Research Center, Hampton, VA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs

(AIAA PAPER 86-1426)

A three-dimensional Navier-Stokes code is used to study the flow through an inlet with a rectangular capture area, but with circular or essentially circular internal cross-sections. The inlet may have a center body extending partially or fully over the length of the inlet. Calculations are made under a variety of geometrical constraints imposed on the inlet cross-sections to study the flow quality in the inlet. It is observed that for this class of inlets, the boundary layer has a tendency to thicken and separate readily due to the adverse pressure gradient caused by the continuous compression in the inlet. Since no experimental results are yet available, this paper has presented only the numerical results from the present analysis. Author

### WAKE INDUCED UNSTEADY AERODYNAMIC INTERACTIONS IN A MULTI-STAGE COMPRESSOR

V. R. CAPACE and S. FLEETER (Purdue University, West Lafayette, IN) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. USAF-supported research. refs

(AIAA PAPER 86-1455)

The effects of steady loading and the detailed aerodynamic forcing function on airfoil row unsteady aerodynamics are investigated and quantified at high reduced frequency values. For the first time, both parallel and normal gust components of the forcing function are considered. This is accomplished by a series of experiments which quantify the unsteady aerodynamics of the first stage vane row of a research compressor. The effects of steady vane aerodynamic loading with both non-constant and constant aerodynamic forcing functions are quantified. These data show that the steady loading affects only the magnitude of the complex dynamic pressure coefficient whereas the ratios of the maximum amplitudes of the parallel and normal components of the aerodynamic forcing function affects both the magnitude and the phase lag. The relative effects of the two components of the time-variant inlet velocity field on the resulting vane row unsteady aerodynamics are also investigated, showing that the parallel component of the aerodynamic forcing function affects only the dynamic pressure coefficient phase lag. The correlation of the dynamic pressure coefficient data with flat plate predictions is also considered. The level and chordwise distribution of the steady aerodynamic loading, not the incidence angle, are revealed to be the key parameters to obtain good correlation with such mathematical models. ### EFFECTS OF S-BENDS ON DIFFUSER INTERNAL PERFORMANCE AND TURBULENCE CHARACTERISTICS

W. H. BALL and A. F. CAMPBELL (Boeing Military Airplane Co., Seattle, WA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs

(AIAA PAPER 86-1459)

This paper presents the results from an experimental program that was conducted to investigate the effects of S-bends on diffuser internal flow behavior. The investigation was conducted using a unique test apparatus that simulates the diffuser entrance conditions behind a M sub 0 = 2.5 supersonic inlet. Results are presented from the theoretical analysis used to design the model and the experimental data obtained during the test program. The results from the program show that, although there are localized regions of separated flow present in the S-bend diffuser, the resulting effects on engine face recovery, turbulence, and distortion are small. ### S-DUCT INLET/DIFFUSERS FOR TURBOPROP OFFSET GEARBOX APPLICATIONS

P. L. MCDILL (Boeing Commercial Airplane Co., Seattle, WA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 7 p.

(AIAA PAPER 86-1462)

A test program, utilizing a large-scale model, was run in the NASA/Lewis Research Center 10 by 10-ft wind tunnel to examine the influence on performance of design parameters of turboprop S-duct inlet/diffuser systems. The parametric test program investigated inlet lip thickness, inlet/diffuser cross-sectional geometry, throat design Mach number, and shaft fairing shape. The test program was run at angles of attack to 15 deg and tunnel Mach numbers to 0.35. Results of the program indicate that current design techniques can be used to design inlet/diffuser systems with acceptable total pressure recovery, but several of the design parameters, notably lip thickness (contraction ratio) and shaft fairing cross section, must be optimized to prevent excessive distortion at the compressor face. ### CALCULATION OF ANNULAR NOZZLE TRISONIC FLOWFIELDS BY THE METHOD OF CHARACTERISTICS

B. N. WANG and J. D. HOFFMAN (Purdue University, West Lafayette, IN) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 17 p. refs

(AIAA PAPER 86-1519)

A numerical algorithm based on the unsteady two-dimensional method of characteristics is presented for calculating axisymmetric inviscid trisonic flowfields in annular nozzles. The algorithm is an explicit second-order accurate predictor-corrector procedure. An inverse marching method based on a local network of wavelines and the pathline is employed, wherein the solution grid in physical space is prespecified. An orthogonal uniform transformed space, obtained by an algebraic grid generation method, is used for flow property interpolation in the initial-data surface. Steady flow solutions are obtained as the asymptotic solution in time. Results are presented for four annular nozzles. Comparison of the predicted and measured wall pressure distributions and nozzle efficiencies show good agreement. Author

### AN LU IMPLICIT SCHEME FOR HIGH SPEED INLET ANALYSIS

S. YOON (NASA, Lewis Research Center; Sverdrup Technology, Inc., Cleveland, OH) and A. JAMESON (Princeton University, NJ) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 7 p. refs

(AIAA PAPER 86-1520)

A numerical method is developed to analyze the inviscid flowfield of a high speed inlet by the solution of the Euler equations. The LU implicit scheme in conjunction with adaptive dissipation proves to be an efficient and robust nonoscillatory shock capturing technique for high Mach nu[illegible] flows as well as for transonic flows. ### IMPROVED EULER ANALYSIS OF ADVANCED TURBOPROP PROPELLER FLOWS

O. YAMAMOTO, J. M. BARTON (Sverdrup Technology, Inc., Middleburg Heights, OH), and L. J. BOBER (NASA, Lewis Research Center, Cleveland, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. refs

(Contract NAS3-24105)

(AIAA PAPER 86-1521)

An implicit approximate factorization scheme in conjunction with a new boundary treatment was used to compute the inviscid flow field about an advanced high-speed propeller. The method of characteristics was used to apply impermeable boundary conditions. The convergence history of numerical calculations shows substantial decrease in the residual error decay. Euler solutions were computed for SR-3 propeller geometry and the results were compared with the experimental data and previous numerical results. Author

### VSAERO ANALYSIS OF A WING/PYLON/NACELLE CONFIGURATION

W. K. LORD and S. H. ZYSMAN (United Technologies Corp., Pratt and Whitney, East Hartford, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. refs

(AIAA PAPER 86-1523)

The VSAERO panel code was used to simulate the flow about a wing/pylon/nacelle configuration for which detailed experimental data were available. Good agreement between analytical and experimental pressure distributions was obtained at subsonic conditions, including prediction of relatively subtle interference effects. It was found that the accuracy of the flow solution can be adversely affected by improper panelling. Interference effects at transonic conditions were not accurately represented by the VSAERO solution, as would be expected based on the linearized-potential formulation. Author

### NUMERICAL NAVIER-STOKES SOLUTIONS OF HIGH SPEED PROPELLER FLOWS

S. J. YOON and J. A. SCHETZ (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. Research supported by the Virginia Center for Coal and Energy Research. refs

(AIAA PAPER 86-1538)

A numerical procedure based on the full, Reynolds averaged Navier-Stokes equations as applied to the flow near a propeller is developed. The flow is assuemd axi-symmetric, and the unsteady equations of motion are solved by MacCormack's explicit scheme. The propeller is modeled as an actuator disk, and turbulent transport is modeled by a mixing length model with a simple extension to include the effects of swirl. Computed flowfield results for the NASA/Hamilton Standrd SR1 and SR3 advanced turboprop (propfan) are compared with wind tunnel data. Good agreement was achieved with the present method. Author

### THEORETICAL AND EXPERIMENTAL ANALYSIS OF HIGHSPEED PROPELLER AERODYNAMICS

J. M. BOUSQUET (ONERA, Chatillon-sous-Bagneux, France) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. refs

(AIAA PAPER 86-1549)

As part of the French CHARME research program to study high speed propellers, a 1-meter diameter propeller has been tested in the S1 Modane wind tunnel. The numerous measurements made during this test give precise data for the validation of calculation methods. Performances are compared to the results of a curved lifting line method, and analyzed with the help of pressure measurements made on spinner and nacelle. Pressures on the blades are compared to the results of a three-dimensional transonic Euler three-dimensional code. Future studies on counterrotating high speed propellers are also outlined. Author

### EVALUATION OF PROPELLER/NACELLE INTERACTIONS IN THE PTA PROGRAM

A. S. ALJABRI, V. LYMAN, and R. J. PARKER (Lockheed-Georgia Co., Marietta) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs

(Contract NAS3-24339)

(AIAA PAPER 86-1552)

Advanced highly-loaded propellers are proposed to power transport aircraft that cruise at high subsonic speeds giving significant fuel savings over the equivalent turbofan engine. In order to realize these savings, the propeller must be installed so that the aerodynamics of the propeller/nacelle combination do not lead to excessive cyclic blade stresses or installation losses. The on-going, NASA sponsored, Propfan Test Assessment Program (PTA) has provided the first high-speed wind-tunnel data on an installed propfan complete with an inlet. This paper presents computational techniques that allow: (1) optimization of inlet plane location, (2) contouring of lip and cowl, and (3) estimation of propeller cyclic loads due to a nonuniform flowfield. These computational methods, in spite of the complexity of the configuration and the slipstream effects, provide predictions of aerodynamic performance which are in excellent agreement with wind-tunnel data. ### A COMPARISON OF COMPUTATIONAL METHODS FOR THREE-DIMENSIONAL, TURBULENT TURBOMACHINERY FLOW FIELDS

K. R. KIRTLEY, M. WARFIELD, and B. LAKSHMINARAYANA (Pennsylvania State University, University Park) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs

(Contract NSG-3266)

(AIAA PAPER 86-1599)

A space-marching method and a time-marching method have been used to compute the three-dimensional turbulent flow in an end wall cascade of airfoils. Using an identical grid and turbulence model, the two codes were used to predict a variety of flow quantities. Predictions by the two methods are compared to each other and to experimental data. In general both methods predict measured quantities well, with a small edge in prediction accuracy going to the space-marching method. Secondary flow comparisons show the time-marching solution more accurately predicting the underturning of the flow in the outer portion of the end wall boundary layer while the space-marching method more accurately predicted the overturning of the flow very near the end wall. The prediction comparisons are discussed along with computational details and other attributes of the two methods. Author

### INITIAL PERFORMANCE EVALUATION OF 2DCD EJECTOR EXHAUST SYSTEMS

D. BROOKE, D. J. DUSA, A. P. KUCHAR, and B. M. ROMINE (General Electric Co., Cincinnati, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p.

(AIAA PAPER 86-1615)

An ejector nozzle system can furnish the cooling flow requirement of advanced nonaxisymmetric exhaust nozzles, perhaps yielding improvements in overall propulsion system performance. An equivalent area method is presently developed on the basis of an existing axisymmetric ejector nozzle prediction program for both nozzle performance (thrust coefficient) and the air-handling characteristics of the nonaxisymmetric designs considered. A scale test model program has been conducted to determine static performance and air handling for four different two-dimensional convergent/divergent exhaust systems. Results adequate for preliminary design studies are obtained. O.C.

### AXIAL-FLOW FAN STALLING BEHAVIOR WITH CIRCUMFERENTIAL INLET SECTORING

W. F. OBRIEN and B. M. CRAMER (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 15 p. refs

(AIAA PAPER 86-1622)

The development of rotating stall in an axial-flow compressor involves circumferential flows in front of the rotor. Experiments are reported in which sectoring struts were installed to interfere with the development of the circumferential flow in a single-stage compressor. On-rotor pressure transducers and stationary probes in front of and behind the rotor were employed to study the effect of the sectoring on the stalling behavior of the stage. Experiments were conducted with and without inlet flow distortion. The sectoring struts altered to stalling behavior of the compressor, in one case changing the rotating stall pattern to multiple cell, progressive stall, and preventing the development of single-cell rotating stall. A method for measurement of the number and rotational speed of the stall cells is reported. Author

**A NUMERICAL ANALYSIS APPLIED TO HIGH ANGLE OF ATTACK THREE-DIMENSIONAL INLETS**

D. P. HWANG (NASA, Lewis Research Center, Cleveland, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. Previously announced in STAR as N86-24658. refs
(AIAA PAPER 86-1527)

The three-dimensional analytical methods used to analyze subsonic high angle of attack inlets are described. The methods are shown to be in good agreement with experimental results for various three-dimensional high angle of attack inlets. The methods are used to predict aerodynamic characteristics of scarf and slotted-lip inlets. E.A.K.

**A86-42761#**

**CORRELATION OF THEORY AND EXPERIMENT FOR PROPFAN INLETS**

V. LYMAN and J. P. HANCOCK (Lockheed Georgia Co., Marietta, GA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. refs
(AIAA PAPER 86-1628)

Studies have indicated that the use of propfans can result in fuel savings of 20 to 25 percent relative to turbofans. Therefore, a program was initated to perform wind tunnel tests on a series of inlet models for advanced tractor, turboprop installations. Single-scoop and twin-scoop inlets and an annular inlet were tested to obtain inlet pressure recovery and distortion, external cowl surface pressures, external cowl forebody drag, and propeller blade stress data. All of the inlets were tested over a range of Mach numbers from .2 to .8 and a range of mass flow ratios. An analysis was undertaken for each of the tested propfan inlet configurations with Lockheed's QUADPAN panel program. Calculated nacelle surface pressures correlates well with experiment as long as the Mach number is low enough to preclude strong shocks on the nacelle and the scoop is large enough to be out of the low energy flow near the nacelle surface aft of the propeller spinner. The effect of the inlet interference flowfield on the propeller was calculated with Lockheed's PROPVRTX propeller analysis program. The results showed that displacing the inlet in the aft direction reduced the adverse effects on the propeller cyclic stresses. Measured propeller stress data support these results. The inlet location and contouring of the inlet lip are important design considerations that can be assessed by computational methods. Author

**FLIGHT RESEARCH ON NATURAL LAMINAR FLOW NACELLES - A PROGRESS REPORT**

E. C. HASTINGS, JR., J. A. SCHOENSTER (NASA, Langley Research Center, Hampton, VA), C. J. OBARA (PRC Kentron, Inc., Hampton, VA), and S. S. DODBELE (Vigyan Research Associates, Inc., Hampton, VA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. refs
(AIAA PAPER 86-1629)

This paper presents a progress report on an ongoing flight experiment for natural laminar flow nacelles. The results given herein were obtained during the first phase of the experiment, in which an instrumented natural laminar flow nacelle fairing was flight tested in the presence of turbofan engine noise and a controlled noise source. The results indicate that with the controlled noise source off, natural laminar flow was measured as far aft as 37 percent of the fairing length. The transition front was irregular in contour, and the extent of natural laminar flow was significantly affected by the relative flow angle for the fairing. In addition to these test results, the paper discusses the results of some recent computational analyses to predict pressure distributions and transition location, and to explain some of the data trends. Comparisons between measured and predicted data indicate that the analytical methods successfully predicted trends for the baseline (no controlled noise source) studies. Author

**MULTI-STAGE COMPRESSOR AIRFOIL AERODYNAMICS. I - AIRFOIL POTENTIAL FLOW ANALYSIS**

H. D. JOSLYN and R. P. DRING (United Technologies Research Center, East Hartford, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. refs
(Contract N00014-84-C-0354)
(AIAA PAPER 86-1744)

An evaluation is made of the ability of potential flow theory to predict pressure distributions on rotor and stator airfoils in the unsteady, three-dimensional environment of a two-stage axial compressor. While excellent agreement is obtained between computational and experimental results for the core flow region, the unsteadiness and three-dimensionality produced by corner stall and rotor tip leakage can generate significant differences. It is further demonstrated, however, that the boundary layer calculations can be coupled to an approximate model for transitional and turbulent flow, together with an inferred level of freestream tubulence, in order to furnish reasonably accurate predictions of midspan loss. O.C.

**TIP LEAKAGE REDUCTION THROUGH TIP INJECTION IN TURBOMACHINES**

M. J. POUAGARE, W. P. WEINHOLD (Duke University, Durham, NC), and K. LAZARUS AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. Army-sponsored research. refs
(AIAA PAPER 86-1746)

This paper describes an experimental study on tip leakage flow reduction through tip injection. A single blade was placed in the test section of a wind-tunnel with a gap between the tip of the blade and the top wall. Surface-streamline flow visualization, leakage flow visualization, blade static pressure measurements, and total pressure measurements behind the blade were performed in order to evaluate the effectiveness of tip injection in reducing leakage flow and losses. Two different patterns of injection were tested. It was found that the effectiveness of the tip injection depended on the injection angle and the injection-hole distribution. The study demonstrated the potential of tip injection in reducing leakage flow and losses as well as in energizing the end-wall boundary layer. Author

**REVERSE FLOW IN MULTISTAGE AXIAL COMPRESSORS**

R. N. GAMACHE (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN) and E. [illegible] GREITZER (MIT, Cambridge, MA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 21 p. Research supported by United Technologies Corp. and USAF. refs
(AIAA PAPER 86-1747)

This paper reports an experimental study of multistage axial compressor operation under reverse flow conditions. The experiments were performed on a high hub-tip ratio ($r_h/r_t = 0.88$) three-stage low aspect ratio axial flow compressor. Complete sets of unstalled and stalled performance characteristics are presented for two builds with different blade stagger angles. The existence of a discontinuous flow mode transition from large scale asymmetry (rotating stall) to blade-to-blade periodic ('annulus stall') at a low reverse flow coefficient is documented. The nature of the annulus stall flow was determined from high response measurements of all three velocity components and pressure at several reverse flow coefficients, using data acquisition and processing techniques developed for flows with multiple sources of periodic unsteadiness. These blade passage resolved measurements provide the first detailed kinematic picture of the flowfield structure which exists in multistage axial compressors during reverse flow operation. The experimental results reveal that the flowfield is strongly three-dimensional. In addition, the upstream measurements show a multilobed spinning acoustic disturbance pattern over a narrow range of reverse flow coefficients corresponding to a level of pressure rise equal to that in rotating stall. At this condition, the blade-to-blade periodicity disappears. Finally, it is shown that there are strong similarities in the structure of the reverse flow and rotating stall cell flowfields. Author

### APPLICATION OF LASER-DUAL-FOCUS VELOCIMETRY IN A COUNTERFLOW

P. MORAES, JR. (Centro Tecnico Aerospacial, Instituto de Atividades Espaciais, Sao Jose dos Campos, Brazil) IN: Optical methods in dynamics of fluids and solids; Proceedings of the International Symposium, Liblice, Czechoslovakia, September 17-21, 1984 . Berlin and New York, Springer-Verlag, 1985, p. 75-82. DFG-supported research.

The flow field of a sonic jet exhausting against a supersonic mean stream was experimentally investigated using a dual-focus laser velocimeter. The experimental investigations were conducted in the 15 x 15-cm supersonic test section of the ILR wind tunnel for mainstream Mach number = 2.0 and total jet/mainstream pressure ratio = 2.0. The paper briefly describes the flow-measurement technique used and presents the flowfield details made possible through these measurements. A comparison of the measured quantities with theoretical results shows good agreement. Author

### ROTATIONAL-TRANSLATIONAL SUBSONIC MOTION OF A FINITE-SPAN WING IN AN IDEAL GAS [VRASHCHATEL'NO-POSTUPATEL'NOE DOZVUKOVOE DVIZHENIE KRYLA KONECHNOGO RAZMAKHA V IDEAL'NOM GAZE]

S. V. MINEVICH Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 1, 1986, p. 34-38. In Russian. refs

An algorithm is presented for the computer calculation of the aerodynamic characteristics of a wing of arbitrary shape with an aspect ratio lambda not less than 2 in rotational-translational motion. The effect of gas compressibility is taken into account by a linearized equation. The accuracy of the calculations was checked on the example of wings of elliptical and rectangular planform in purely rotational or purely translational motion. The accuacy of the proposed method is compared with that of the methods of Karafoli (1956, 1960) and Belotserkovskii (1965). B.J.

### MATHEMATICAL MODEL OF THE INTERACTION OF A SINGLE UNSTEADY SUPERSONIC JET WITH A MOVING BARRIER OF FINITE SIZE [MATEMATICHESKAIA MODEL' VZAIMODEISTVIIA ODINOCHNOI NESTATSIONARNOI SVERKHZVUHKOVOI STRUI S PODVIZHNOI PREGRADOI KONECHNYKH RAZMEROV]

A. V. KUZNETSOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 1, 1986, p. 99-102. In Russian. refs

The interaction of an unsteady supersonic jet with a moving barrier of finite size placed transverse to the flow is investigated with reference to the use of pulsating flows and gasdynamic generators in various industrial processes to intensify mass transfer. A method is developed for determining the actual geometrical characteristics of the barrier, its motion in the jet, and its influence on the formation of the flow pattern. It is concluded that the proposed mathematical model is valid for arbitrary intrachamber processes and axisymmetric barriers of complex profile. B.J.

### EFFECT OF LONGITUDINAL-CONTOUR SHAPE ON THE AERODYNAMIC CHARACTERISTICS OF LIFTING BODIES AT SUPERSONIC AND HYPERSONIC FLIGHT VELOCITIES [VLIIANIE FORMY PRODOL'NOGO KONTURA NA AERODINAMICHESKIE KHARAKTERISTIKI NESUSHCHIKH KORPUSOV PRI SVERKHZVUKOVYKH I GIPERZVUKOVYKH SKOROSTIAKH POLETA]

I. I. MAZHUL Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 1, 1986, p. 102-105. In Russian.

The effect of flow expansion at the rear part of a lifting body on the aerodynamic characteristics is investigated for a fixed geometry of the front part of the body. It is shown that a change in the shape of the longitudinal contour of the upper or lower surface causes an increase in the size of the lifting body without substantial losses in the maximum lift-drag ratio. B.J.

**A86-43403**

### INVESTIGATION OF THE STRUCTURE OF A SUPERSONIC JET ISSUING FROM A FREE-VORTEX NOZZLE BY MEANS OF PULSED HOLOGRAPHIC INTERFEROMETRY [ISSLEDOVANIE STRUKTURY SVERKHZVUKOVOI STRUI, ISTEKAIUSHCHEI IZ SVOBODNOVIKHREVOGO SOPLA, METODOM IMPUL'SNOI GOLOGRAFICHESKOI INTERFEROMETRII]

V. I. PANCHENKO, A. A. GILERSON, and B. S. VINOGRADOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 1, 1986, p. 105-107. In Russian.

Holographic interferometry was used to study the flow of a free-vortex jet beyond the nozzle in design conditions as well as when pressures on both boundaries of the jet differed from pressures on the nozzle section. The growth of the boundary layers on the jet boundaries is studied in both design and off-design conditions for different streamline curvatures of the ideal flow. B.J.

**A86-43404**

### EXPERIMENTAL STUDY OF SUPERSONIC FLOW AROUND A SINGLE-STAGE WEDGE WITH CHEEKS AT SIDESLIP ANGLES [EKSPERIMENTAL'NOE ISSLEDOVANIE OBTEKANIIA ODNOSTUPENCHATOGO KLINA SO SHCHEKAMI SVERHZVUKOVYM POTOKOM NA UGLAKH SKOL'ZHENIIA]

V. V. DUGANOV, N. N. ZAKHAROV, and O. K. IVANOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 1, 1986, p. 107-110. In Russian. refs

Experimental results are presented concerning flow around a single-stage wedge with side cheeks (a configuration typical for two-dimensional supersonic intakes) at sideslip angles of 0, 5, and 10 deg. Experiments were carried out in a wind tunnel at a Mach number of 2.1, a Reynolds number of 10 to the 8th (for a characteristic dimension of 1 m), and a stagnation temperature of 288 K. The pressure distributions are examined, and the shock-wave configuration generated in the flow is discussed. B.J.

**A86-43421**

### FEATURES OF THE FLOW STRUCTURE AROUND POLYGONAL LIFTING BODIES AT SUPERSONIC VELOCITIES [OSOBENNOSTI STRUKTURY OBTEKANIIA POLIGONAL'NYKH NESUSHCHIKH KORPUSOV PRI SVERKHZVUKOVYKH SKOROSTIAKH]

I. I. MAZHUL (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) Akademiia Nauk SSSR, Sibirskoe Otdelenie, Izvestiia, Seriia Tekhnicheskie Nauki (ISSN 0002-3434), March 1986, p. 50-54. In Russian.

The flow characteristics around polygonal lifting bodies consisting of a combination of plane elements were studied experimentally at Mach numbers of 2, 3, and 4, and Reynolds numbers of 26 x 10 to the 6th, 33.5 x 10 to the 6th, and 50 x 10 to the 6th. It is shown that configurations of this type are characterized by the presence of internal shocks and boundary layer separation zones (induced by these shocks) on the lower surface. Another feature is the formation of conical vortex zones along swept lines of plane-face intersection on both upper and lower surfaces. The behavior of these features is studied in relation to the flow conditions. B.J.

**LASER FRINGE ANEMOMETRY FOR AERO ENGINE COMPONENTS**

A. J. STRAZISAR 1986 54 p Presented at the 67th Symposium of the AGARD Propulsion and Energetics Panel on Advanced Instrumentation for Aero Engine Components, Philadelphia, Pa., 19-23 May 1986

(NASA-TM-88798; E-3135; NAS 1.15:88798) Avail: NTIS HC A02/MF A01 CSCL 01A

Advances in flow measurement techniques in turbomachinery continue to be paced by the need to obtain detailed data for use in validating numerical predictions of the flowfield and for use in the development of empirical models for those flow features which cannot be readily modelled numerically. The use of laser anemometry in turbomachinery research has grown over the last 14 years in response to these needs. Based on past applications and current developments, this paper reviews the key issues which are involved when considering the application of laser anemometry to the measurement of turbomachinery flowfields. Aspects of laser fringe anemometer optical design which are applicable to turbomachinery research are briefly reviewed. Application problems which are common to both laser fringe anemometry (LFA) and laser transit anemometry (LTA) such as seed particle injection, optical access to the flowfield, and measurement of rotor rotational position are covered. The efficiency of various data acquisition schemes is analyzed and issues related to data integrity and error estimation are addressed. Real-time data analysis techniques aimed at capturing flow physics in real time are discussed. Finally, data reduction and analysis techniques are discussed and illustrated using examples taken from several LFA turbomachinery applications. Author

**MULTIAXIS AIRCRAFT CONTROL POWER FROM THRUST VECTORING AT HIGH ANGLES OF ATTACK**

F. J. CAPONE and M. L. MASON Jun. 1986 51 p Presented at the AIAA 4th Applied Aerodynamics Conference, San Diego, Calif., 9-11 Jun. 1986

(NASA-TM-87741; NAS 1.15:87741; AIAA-86-1779) Avail: NTIS HC A03/MF A01 CSCL 01A

Extensive research programs conducted at the Langley Research Center have shown that thrust vectoring can be provided by multifunction (nonaxisymmetric) nozzles. Most of this research has been conducted on pitch vectoring at both static and forward flight conditions. Recent efforts have been aimed at evaluating yaw vectoring concepts at static (wind off) conditions. This paper summarizes results for three different twin-engine fighter configurations tested over a Mach number range of 0.15 to 2.47 at angles of attack up to 35 deg. The objective of these investigations was to determine the multiaxis control power characteristics provided by thrust vectoring. All three configurations employed two-dimensional convergent-divergent nozzles which provided pitch vectoring by differential deflection of the upper and lower nozzle divergent flaps. Three different means of yaw vectoring were tested: (1) a translating nozzle sidewall; (2) yaw flaps located in the nozzle sidewalls; and (3) canted nozzles. These investigations were conducted in the Langley 16-Foot Transonic Tunnel and the Lewis 10x10-Foot Supersonic Tunnel. Longitudinal and direction control power from thrust vectoring was greater than that provided by aerodynamic control effectors at low speed or at high angles of attack. Author

A full-scale, tilt-nacelle V/STOL aircraft model was tested in hover at the National Full Scale Aerodynamics Complex (NFAC), NASA Ames Research Center. The model was powered by two TF-34 turbofan engines. It was tested at several ground heights and control deflections. Test technique and test setup were documented. Limited results show that: (1) a small change in control power with ground height was measured, and control power was found to be good over + or - 20 deg of horizontal vane deflection; (2) integrated fuselage undersurface pressures, when compared with the total model loads and measured thrust, defined the effect of the fountain and its related flow field on model forces and moments; and (3) there was no indication of hot gas ingestion during simulated takeoff in calm winds from wheels on deck ground height. **A PERSPECTIVE OF COMPUTATIONAL FLUID DYNAMICS**

P. KUTLER May 1986 22 p Presented at the National Aerospace Lab., Tokyo, Japan, 20 Jun. 1986

(NASA-TM-88246; A-86224; NAS 1.15:88246) Avail: NTIS HC A02/MF A01 CSCL 01A

Computational fluid dynamics (CFD) is maturing, and is at a stage in its technological life cycle in which it is now routinely applied to some rather complicated problems; it is starting to create an impact on the design cycle of aerospace flight vehicles and their components. CFD is also being used to better understand the fluid physics of flows heretofore not understood, such as three-dimensional separation. CFD is also being used to complement and is being complemented by experiments. In this paper, the primary and secondary pacing items that govern CFD in the past are reviewed and updated. The future prospects of CFD are explored which will offer people working in the discipline challenges that should extend the technological life cycle to further increase the capabilities of a proven demonstrated technology. **ROTOR/WING AERODYNAMIC INTERACTIONS IN HOVER**

F. F. FELKER and J. S. LIGHT May 1986 27 p Presented at the 42nd Annual Forum of the American Helicopter Society, 2-4 Jun. 1986

(NASA-TM-88255; A-86246; NAS 1.15:88255) Avail: NTIS HC A03/MF A01 CSCL 01A

An experimental and theoretical investigation of rotor/wing aerodynamic interactions in hover is described. The experimental investigation consisted of both a large-scale and small-scale test. A 0.658-scale, V-22 rotor and wing was used in the large-scale test. Wind download, wing surface pressure, rotor performance, and rotor downwash data from the large-scale test are presented. A small-scale experiment was conducted to determine how changes in the rotor/wing geometry affected the aerodynamic interactions. These geometry variations included the distance between the rotor and wing, wing incidence angle, and configurations both with the rotor axis at the tip of the wing (tilt rotor configuration) and with the rotor axis at the center of the wing (compound helicopter configuration). A wing with boundary-layer control was also tested to evaluate the effect of leading and trailing edge upper surface blowing on the wing download. A computationally efficient, semi-empirical theory was developed to predict the download on the wing. Finally, correlations between the theoretical predictions and test data are presented. Author

**PATCHED-GRID CALCULATIONS WITH THE EULER AND NAVIER-STOKES EQUATIONS: THEORY AND APPLICATIONS**
M. M. RAI Feb. 1986 105 p Presented at the Lecture Series on CFD, Rhode-St-Genese, Belgium, 3-7 Mar. 1986
(NASA-TM-88228; REPT-86112; NAS 1.15:88228) Avail: NTIS HC A06/MF A01 CSCL 01A

A patched-grid approach is one in which the flow region of interest is divided into subregions which are then discretized independently using existing grid generator. The equations of motion are integrated in each subregion in conjunction with patch-boundary schemes which allow proper information transfer across interfaces that separate subregions. The patched-grid approach greatly simplifies the treatment of complex geometries and also the addition of grid points to selected regions of the flow. A conservative patch-boundary condition that can be used with explicit, implicit factored and implicit relaxation schemes is described. Several example calculations that demonstrate the capabilities of the patched-grid scheme are also included. Author

**AN INVESTIGATION OF THE FEASIBILITY OF ACTIVE BOUNDARY LAYER THICKENING FOR AIRCRAFT DRAG REDUCTION Final Report, period ending 3 Mar. 1986**
R. L. ASH and C. KOODALATTUPURAM Apr. 1986 15 p
(Contract NAG1-121)
(NASA-CR-177133; NAS 1.26:177133) Avail: NTIS HC A02/MF A01 CSCL 01A

The feasibility of using a forward mounted windmilling propeller to extract momentum from the flow around an axisymmetric body to reduce total drag has been studied. Numerical calculations indicate that a net drag reduction is possible when the energy extracted is returned to an aft mounted pusher propeller. However, net drag reduction requires very high device efficiencies. Results of an experimental program to study the coupling between a propeller wake and a turbulent boundary layer are also reported. The experiments showed that a complex coupling exists and simple modes for the flow field are not sufficiently accurate to predict total drag. Author

**TRANSONIC AND SUPERSONIC WIND TUNNEL TESTS ON SCHEMATIC MISSILE CONFIGURATIONS WITH TWO DIFFERENT NOSE LENGTHS**
S. E. GUDMUNDSON and L. TORNGREN Sep. 1985 93 p
(Contract FMV-F-K-82223-75-007-07-001; FMV-F-K-82223-76-001-21-001)
(FFA-TN-1984-62; ESA-86-97051) Avail: NTIS HC A05/MF A01

A wind tunnel investigation at transonic and supersonic speeds for schematic missile models including body alone, body-tail, body-wing, and body-wing-tail configurations was performed. The test gives symmetric force and moment coefficients for an angle of attack range of 0 to 24 deg at Mach numbers from 0.7 to 2.99. Two different ogival noses with length/diameter ratio 3.5 and 1.5 were used. The influence of the nose length on normal force, pitching moment and axial force was studied. Examples of effects on asymmetric coefficients are given. ESA

**COMPUTATION OF THE TRANSONIC FLOW ABOUT A SWEPT WING IN THE PRESENCE OF AN ENGINE NACELLE Research and Development Report**
D. EOSS Dec. 1985 191 p
(Contract NAG2-345; DE-AC02-76ER-03077; NSF DMS-83-20430)
(NASA-CR-177113; NAS 1.26:177113; DOE/ER-03077/267)
Avail: NTIS CSCL 01A

A method was developed to model the effects of an engine nacelle on the transonic flow about a swept wing. The nacelle is modeled by adding an inhomogeneous term, which represents a source distribution, to the potential equation, which is solved by relaxation. The method is an extension of the design code FL22INV of Bauer, Garabedian, and McFadden, which was based on Caughy and Jameson's FLO22 and on the oblique wing code FLO16. In order to obtain a sharply defined obstacle using a source distribution on a finite difference grid, a small grid size near the source was used. This was accomplished through a mapping of the flow domain to the computational domain. Once the flow is computed, the size and position of the nacelle are found by tracing streamlines. The effect of the presence of an engine nacelle on the shock waves which form about a swept wing in transonic flight. Author

**AN ANALYSIS OF BLADE VORTEX INTERACTION AERODYNAMICS AND ACOUSTICS**
D. J. LEE Sep. 1985 173 p
(Contract NCC2-149)
(NASA-CR-177016; NAS 1.26:177016; SU-JIAA-TR-67) Avail: NTIS HC A08/MF A01 CSCL 01A

The impulsive noise associated with helicopter flight due to Blade-Vortex Interaction, sometimes called blade slap is analyzed especially for the case of a close encounter of the blade-tip vortex with a following blade. Three parts of the phenomena are considered: the tip-vortex structure generated by the rotating blade, the unsteady pressure produced on the following blade during the interaction, and the acoustic radiation due to the unsteady pressure field. To simplify the problem, the analysis was confined to the situation where the vortex is aligned parallel to the blade span in which case the maximum acoustic pressure results. Acoustic radiation due to the interaction is analyzed in space-fixed coordinates and in the time domain with the unsteady pressure on the blade surface as the source of chordwise compact, but spanwise non-compact radiation. Maximum acoustic pressure is related to the vortex core size and Reynolds number which are in turn functions of the blade-tip aerodynamic parameters. Finally noise reduction and performance are considered. Author

**ANALYTICAL OBSERVATIONS ON THE AERODYNAMICS OF A DELTA WING WITH LEADING EDGE FLAPS**
S. OH and D. TAVELLA Mar. 1986 69 p
(Contract NCC2-74)
(NASA-CR-177022; NAS 1.26:177022; SU-JIAA-TR-74) Avail: NTIS HC A04/MF A01 CSCL 01A

The effect of a leading edge flap on the aerodynamics of a low aspect ratio delta wing is studied analytically. The separated flow field about the wing is represented by a simple vortex model composed of a conical straight vortex sheet and a concentrated vortex. The analysis is carried out in the cross flow plane by mapping the wing trace, by means of the Schwarz-Christoffel transformation into the real axis of the transformed plane. Particular attention is given to the influence of the angle of attack and flap deflection angle on lift and drag forces. Both lift and drag decrease with flap deflection, while the lift-to-drag ratioe increases. A simple coordinate transformation is used to obtain a closed form expression for the lift-to-drag ratio as a function of flap deflection. The main effect of leading edge flap deflection is a partial suppression of the separated flow on the leeside of the wing. Qualitative comparison with experiments is presented, showing agreement in the general trends. Author

**A STUDY OF THE FACTORS AFFECTING BOUNDARY LAYER TWO-DIMENSIONALITY IN WIND TUNNELS**
R. D. MEHTA and P. H. HOFFMANN May 1986 29 p
(Contract NCC2-294)
(NASA-CR-177023; NAS 1.26:177023; SU-JIAA-TR-66) Avail: NTIS HC A03/MF A01 CSCL 01A

The effect of screens, honeycombs, and centrifugal blowers on the two-dimensionality of a boundary layer on the test section floors of low-speed blower tunnels is studied. Surveys of the spanwise variation in surface shear stress in three blower tunnels revealed that the main component responsible for altering the spanwise properties of the test section boundary layer was the last screen, thus confirming previous findings. It was further confirmed that a screen with varying open-area ratio, produced an unstable flow. However, contrary to popular belief, it was also found that for given incoming conditions and a screen free of imperfections, its open-area ratio alone was not enough to describe its performance. The effect of other geometric parameters such as the type of screen, honeycomb, and blower were investigated. In addition, the effect of the order of components in the settling chamber, and of wire Reynolds number were also studied. Author

**THE USE OF A PANEL CODE ON HIGH LIFT CONFIGURATIONS OF A SWEPT FORWARD WING Final Report, 31 Sep. 1983 - 31 Mar. 1985**
J. S. SCHEIB and D. R. SANDLIN 31 Mar. 1985 70 p
(Contract NCC2-255)
(NASA-CR-176968; NAS 1.26:176968) Avail: NTIS HC A04/MF A01 CSCL 01A

A study was done on high lift configurations of a generic swept forward wing using a panel code prediction method. A survey was done of existing codes available at Ames, frow which the program VSAERO was chosen. The results of VSAERO were compared with data obtained from the Ames 7- by 10-foot wind tunnel. The results of the comparison in lift were good (within 3.5%). The comparison of the pressure coefficients was also good. The pitching moment coefficients obtained by VSAERO were not in good agreement with experiment. VSAERO's ability to predict drag is questionable and cannot be counted on for accurate trends. Further studies were done on the effects of a leading edge glove, canards, leading edge sweeps and various wing twists on spanwise loading and trim lift with encouraging results. An unsuccessful attempt was made to model spanwise blowing and boundary layer control on the trailing edge flap. The potential results of VSAERO were compared with experimental data of flap deflections with boundary layer control to check the first order effects. Author

**IDENTIFICATION OF LINEARIZED EQUATIONS OF MOTION FOR THE FIXED WING CONFIGURATION OF THE ROTOR SYSTEMS RESEARCH AIRCRAFT Final Report, 19 Mar. 1985 - 19 Mar. 1986**
D. L. BALOUGH and D. R. SANDLIN Mar. 1986 98 p
(Contract NCC2-258)
(NASA-CR-176977; NAS 1.26:176977) Avail: NTIS HC A05/MF A01 CSCL 01A

The purpose of this report is to establish linear, decoupled models of rigid body motion for the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA). Longitudinal and lateral control surface fixed linear models were created from aircraft time histories using current system identification techniques. Models were obtained from computer simulation at 160 KCAS and 200 KCAS, and from flight data at 160 KCAS. Comparisons were performed to examine modeling accuracy, variation of dynamics with airspeed and correlation of simulation and flight data results. The results showed that the longitudinal and lateral linear models accurately predicted RSRA dynamics. The flight data results showed that no significant handling qualities problems were present in the RSRA fixed wing aircraft at the flight speed tested. Author

**WAKE SHAPE AND ITS EFFECTS ON AERODYNAMIC CHARACTERISTICS**
H. EMDAD and C. E. LAN Hampton, Va. NASA Jul. 1986 116 p
(Contract NAG1-134)
(NASA-CR-178118; NAS 1.26:178118) Avail: NTIS HC A06/MF A01 CSCL 01A

The wake shape under symmetrical flight conditions and its effects on aerodynamic characteristics are examined. In addition, the effect of wake shape in sideslip and discrete vortices such as strake or forebody vortex on lateral characteristics is presented. The present numerical method for airplane configurations, which is based on discretization of the vortex sheet into vortex segments, verified the symmetrical and asymmetrical roll-up process of the trailing vortices. Also, the effect of wing wake on tail planes is calculated. It is concluded that at high lift the assumption of flat wake for longitudinal and lateral-directional characteristics should be reexamined. Author

**A COMPARISON OF COMPUTER-GENERATED LIFT AND DRAG POLARS FOR A WORTMANN AIRFOIL TO FLIGHT AND WIND TUNNEL RESULTS Final Report**
A. H. BOWERS and D. R. SANDLIN Jun. 1984 46 p
(NASA-CR-176963; NAS 1.26:176963) Avail: NTIS HC A03/MF A01 CSCL 01A

Computations of drag polars for a low-speed Wortmann sailplane airfoil are compared to both wind tunnel and flight results. Excellent correlation is shown to exist between computations and flight results except when separated flow regimes were encountered. Wind tunnel transition locations are shown to agree with computed predictions. Smoothness of the input coordinates to the PROFILE airfoil analysis computer program was found to be essential to obtain accurate comparisons of drag polars or transition location to either the flight or wind tunnel results. (Contract NCC4-1)
(NASA-CR-176995; NAS 1.26:176995) Avail: NTIS HC A03/MF A01 CSCL 01A

Flight test and theoretical aerodynamic data were obtained for a flight test fixture mounted on the underside of an F-104G aircraft. The theoretical data were generated using two codes, a two dimensional transonic code called Code H, and a three dimensional subsonic and supersonic code call wing-body. Pressure distributions generated by the codes for the flight test fixture as well as boundary layer displacement thickness generated by the two dimensional code were compared to the flight test data. The two dimensional code pressure distributions compared well except at the minimum pressure point and trailing edge. Shock locations compared well except at high transonic speeds. The three dimensional code pressure distributions compared well except at the trailing edge of the flight test fixture. The two dimensional code does not predict displacement thickness of the flight test fixture well. Author

**EXPERIMENTAL ANALYSES OF TRAILING EDGE FLOWS Final Technical Report**
S. L. PETRIE and D. S. EMMER Jun. 1984 96 p
(Contract NSG-2298)
(NASA-CR-176904; NAS 1.26:176904) Avail: NTIS HC A05/MF A01 CSCL 01A

An experimental study of several of the trailing edge and wake turbulence properties for a NACA 64A010 airfoil section was completed. The experiment was conducted at the Ohio State University Aeronautical and Astronautical Research Laboratory in the 6 inch X 22 inch transonic wind tunnel facility. The data were obtained at a free stream Mach number of 0.80 and a flow Reynolds number (based on chord length) of 5 million. The principle diagnostic tool was a dual-component laser Doppler velocimeter. The experimental data included surface static pressures, chordwise and vertical mean velocities, RMS turbulence intensities, local flow angles, and a determination of turbulence kinetic energy in the wake. Two angles of attack (0 and 2 degrees) were investigated. At these incidence angles, four flow field surveys were obtained ranging in position from the surface of the airfoil, between the transonic shock and the trailing edge, to the far-wake. At both angles of attack, the turbulence intensities and turbulence kinetic energy were observed to decay in the streamwise direction. In the far wake, for the non-lifting case, the turbulence intensities were nearly isotropic. For the two degree case, the horizontal component of the turbulence intensity was observed to be substantially higher than the vertical component. Author

**MEASUREMENTS ON WING-TIP BLOWING**
D. TAVELLA, N. WOOD, and P. HARRITS Jun. 1985 41 p
(Contract NCC2-271)
(NASA-CR-176930; NAS 1.26:176930; JIAA-TR-64) Avail: NTIS HC A03/MF A01 CSCL 01A

The aerodynamics of a rectangular wing with a jet exhausting in the spanwise direction from the tips has been explored experimentally. By effectively changing the span of the wing as well as outwardly displacing the tip vortices, such jets can induce aerodynamic forces that could be used for roll and lateral control of aircraft. The concept has been investigated for a variety of jet intensities, angles of attack, and aspect ratios. The results appear to confirm theoretically predicted scaling laws for lift gain and moment generation due to blowing. Author

**A THEORY FOR LATERAL WING-TIP BLOWING**
D. TAVELLA and L. ROBERTS Jun. 1985 40 p
(Contract NCC2-271)
(NASA-CR-176931; NAS 1.26:176931; JIAA-TR-60) Avail: NTIS HC A03/MF A01 CSCL 01A

The concept of lateral blowing consists in utilizing thin jets of air, which are ejected in the spanwise direction from slots at the tips of straight and swept wings, or along the leading edges of delta wings, to generate aerodynamic forces without the assistance of deflecting solid surfaces. For weak intensities of blowing the so-generated forces could be used for roll and lateral control of aircraft. In this work a theory for this concept as applied to straight wings is presented, revealing the analytical relationship between blowing and aerodynamic forces. The approach is based on perturbing the span of an elliptically loaded wing. Scaling laws involving blowing intensity, aspect ratio, and angle of attack are derived and compared with experiments. It is concluded that this concept has potential as a novel roll and lateral control device. Author

**CRITICAL EVALUATION OF THE UNSTEADY AERODYNAMICS APPROACH TO DYNAMIC STABILITY AT HIGH ANGLES OF ATTACK Final Report**
W. H. HUI Feb. 1985 46 p
(Contract NAGW-575)
(NASA-CR-177104; NAS 1.26:177104; WRI-PRO-308-07) Avail: NTIS HC A03/MF A01 CSCL 01A

Bifurcation theory is used to analyze the nonlinear dynamic stability characteristics of an aircraft subject to single-degree-of-freedom. The requisite moment of the aerodynamic forces in the equations of motion is shown to be representable in a form equivalent to the response to finite amplitude oscillations. It is shown how this information can be deduced from the case of infinitesimal-amplitude oscillations. The bifurcation theory analysis reveals that when the bifurcation parameter is increased beyond a critical value at which the aerodynamic damping vanishes, new solutions representing finite amplitude periodic motions bifurcate from the previously stable steady motion. The sign of a simple criterion, cast in terms of aerodynamic properties, determines whether the bifurcating solutions are stable or unstable. For the pitching motion of flat-plate airfoils flying at supersonic/hypersonic speed and for oscillation of flaps at transonic speed, the bifurcation is subcritical, implying either the exchanges of stability between steady and periodic motion are accompanied by hysteresis phenomena, or that potentially large aperiodic departures from steady motion may develop. **FIRST ORDER ANALYSIS OF THE EFFECT OF PITCHING ON THE DRAG COEFFICIENT**

R. E. WILSON and J. A. NEFF Nov. 1985 39 p
(Contract DE-AC04-76DP-00789)
(DE86-006324; SAND-85-7003) Avail: NTIS HC A03/MF A01

A first order analysis was made for the drag coefficient of a pitching NACA 0015 airfoil below stall. The inviscid velocity ditribution for a translating NACA 0015 airfoil was superimposed with the additional circulation velocity for a pitching ellipse. The resulting velocity distribution was used to numerically integrate a momentum/boundary layer formulation to obtain the drag coefficient. For both laminar and turbulent boundary layers it was found that the effect of pitching on the drag coefficient can be approximated by a shift in angle of attack. The shift angle was found to be a linear function of the pitching velocity and to be less than the induced angle of attack caused by the pitching. DOE

**DESIGN OF TRANSONIC AIRFOILS WITH GIVEN PRESSURE, SUBJECT TO GEOMETRIC CONSTRAINTS**

J. M. J. FRAY, J. W. SLOOFF, J. W. BOERSTOEL, and A. KASSIES 13 Jul. 1984 36 p
(NLR-TR-84064-U; B8660349; ESA-86-97504) Avail: NTIS HC A03/MF A01

An iterative method for the design of airfoils having a prescribed pressure distribution in subsonic or transonic flow is described. In each iteration step, the difference between the current and a target pressure distributions (residual) is determined by a multigrid finite volume full-potential code. Corrections to the geometry driving the pressure residual to zero are determined by a global, inverse, thin-airfoil theory for the subsonic part of the flow field, and by a local, inverse, wavy-wall theory for the supersonic part. The geometry correction is formulated as a minimization problem in the sense that pressure distribution and geometry requirements may be balanced in a weighted least squares sense. ESA

**THE MARKET PRICE FOR AIR SAFETY**

H. A. HOPKINS International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Sept. 1985, p. 181-186.

An evaluation is made of the extent to which the financial and market objectives that are preeminent in the deregulated commercial environment in which many airlines now compete may affect flight safety. A comparison of fatal accident rates per million flights for the 1973-1984 period with the per capita income of various countries in 1981 appears to imply some relationship between the amount of money available and the rate of fatal accidents. Attention is given to the apportionment of responsibility for safety to airline management, the deregulated airline environment in the U.S. and questions it has raised concerning corner-cutting, and the monitoring of management performance. O.C.

**REGULATION BY THE CIVIL AVIATION AUTHORITY OF AIR SAFETY IN THE UNITED KINGDOM**

G. WHITE (Civil Aviation Authority, London, England) International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Dec. 1985, p. 238-241, 302.

The functions of the Civil Aviation Authority (CAA) related to air safety in the United Kingdom are described. The CAA requires the registration and marking of aircraft, and evaluates the operation and training manuals submitted by public transport aircraft. The requirements for issuing of air operator certificates and airworthiness certificates are discussed. The licensing of flight crews, air traffic controllers, and airfields is examined. The CAA has full authority to enforce its regulations by refusing, revoking, or suspending certificates and licenses. It is also necessary for the CAA to provide air navigation services, which consist of information, directions, and facilities furnished, issued, or provided in connection with the navigation or movement of aircraft. I.F.

**POLICING AVIATION SAFETY IN THE NETHERLANDS**

R. M. SCHNITKER (Netherlands National Police Force, Aviation Investigation Dept.) International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Dec. 1985, p. 245-254.

The monitoring of aviation safety by the aviation branch of the Dutch National Police Force is discussed. The police force is required to examine aircraft registrations and pilot qualifications at airports and other aviation locations. The procedures involved in preventing and controlling aviation accidents are described. The checking of cargo to ensure proper transportation of dangerous materials and of passengers to prevent potential aviation crimes is examined. The National Police Force coordinates their activities with local police forces, public prosecutors, and the government's aviation department in order to assure aviation safety. I.F.

**PROTECTING ELECTRONICS AGAINST LIGHTNING GETS HARDER**

E. J. LERNER Aerospace America (ISSN 0740-722X), vol. 24, May 1986, p. 30-32, 34.

The problem of protecting aircraft electronics from lightning strikes, when electronics are becoming both more vulnerable and more central to flight safety, is considered. Graphite composites are replacing aluminum in the skin of many aircraft, and as a result the interior electronics are not so well shielded from the 20-30-kA current of even an average lightning strike. It is noted that the FAA will soon introduce testing standards - based on present voluntary tests - for certifying that the electronics of a plane are fully shielded against lightning. A Boeing simulator will send 200-kA pulses (equal to very large lightning bolts) through full-scale aircraft. The two basic methods of protecting electronics shielding with metal and electronic isolation from induced charges - are both discussed. D.H.

**PILOT REPORT - B-1B**
M. A. KENNY (USAF, Dyess AFB, TX) Air Force Magazine (ISSN 0730-6784), vol. 69, June 1986, p. 58-62.

An account is given of the cockpit environment, flight control activities and an in-flight refueling session aboard the B-1B bomber, whose properties in these various functions derive from the extensive use of computerized control. The aircraft possesses the agility to maneuver between hills, as well as the ability to fly just above any type of terrain, in any weather. Attention is given to the crew activities associated with a low level bombing run at the Dyess Air Force Base test range. O.C.

**FROM A STRIKE TO A KILL**
M. SMITH New Scientist (ISSN 0028-6664), vol. 110, May 29, 1986, p. 44-47.

Numerous bird collisions with aircraft have occurred at major airports over the past quarter century, sometimes resulting in loss of life and aircraft. The birds are sucked into the engines or collide with various parts of the aircraft. Although gulls comprise 40 percent of the problem species, difficulties also arise with lapwing (26 percent), partridges, snipes, kestrels, swallows, skylarks, etc. Wide-bodied jets are struck seven times as frequently as older, narrow-bodied aircraft. Personnel at Kennedy Airport and other airports use recorded distress calls, pyrotechnic devices and a shotgun to drive of birds. A persistent difficulty in keeping birds away is garbage dumps close to airports providing bountiful food for birds. The most effective method for warding off birds has been to keep grass around runways cut no shorter than 20 cm. The technique has been enhanced by removing earthworms from runways during rainy periods so that birds aren't drawn to the food. M.S.K.

**TIME-BASED AIR TRAFFIC MANAGEMENT USING EXPERT SYSTEMS**
L. TOBIAS and J. L. SCOGGINS Apr. 1986 59 p
(NASA-TM-88234; A-86188; NAS 1.15:88234) Avail: NTIS HC A04/MF A01 CSCL 07G

A prototype expert system was developed for the time scheduling of aircraft into the terminal area. The three functions of the air traffic control schedule advisor are as follows: first, for each new arrival, it develops an admissible flight plan for that aircraft. Second, as the aircraft progresses through the terminal area, it monitors deviations from the flight plan and provides advisories to return the aircraft to its assigned schedule. Third, if major disruptions such as missed approaches occur, it develops a revised plan. The advisor is operational on a Symbolics 3600, and is programed in MRS (a logic programming language), Lisp, and FORTRAN. Author

About 1016 Pacific standard time February 19, 1985, China Airlines Flight 006, a Boeing 747 SP-09, enroute to Los Angeles, California from Taipei, Taiwan, suffered an inflight upset The flight from Taipei to about 300 nmi northwest of San Francisco was uneventful and the airplane was flying at about 41,000 feet mean sea level when the No. 4 engine lost power. The National Transportation Safety Board determines that the probable cause of the accident was the captain's preoccupation with an inflight malfunction and his faiuare to monitor properly the airplane's flight instruments which resulted in his losing control of the airplane. Contributing to the accident was the captain's over-reliance on the autopilot after the loss of thrust on the No. 4 engine. GRA

**ANNUAL REVIEW OF AIRCRAFT ACCIDENT DATA. US AIR CARRIER OPERATIONS: CALENDAR YEAR 1982**
1982 111 p
(PB86-212529; NTSB-ARC-86-01) Avail: NTIS HC A06/MF A01

The record of aviation accidents involving revenue operations of U.S. Air Carriers are presented, including Commuter Air Carriers and On Demand Air Taxis for calender year 1982. In 1979 and prior years, accidents involving the smaller aircraft used by Commuters and On Demand Air Taxis were reported in annual reviews of general aviation accidents. Three major sections are presented according to the federal regulations under which the flight was conducted: 14 CFR 121, 125, 127, Scheduled 14 CFR 135. In each section, tables are presented to describe the losses and characteristics of 1982 accidents to enable comparison with pior years. Author

## AIRCRAFT COMMUNICATIONS AND NAVIGATION

**Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.**

**A86-40116#**

### INTEGRATED NAVIGATION, COMMUNICATION, AND SURVEILLANCE SYSTEMS BASED ON STANDARD DISTANCE MEASURING EQUIPMENT

A. BECKER (DFVLR, Institut fuer Flugfuehrung, West Germany) (International Council of the Aeronautical Sciences, Congress, 14th, Toulouse, France, September 9-14, 1984, Proceedings. Volume 2, p. 1225/a-1225/k) Journal of Aircraft (ISSN 0021-8669), vol. 23, May 1986, p. 406-414. Previously cited in issue 22, p. 3183, Accession no. A84-45064. refs

**A86-40227**

### AIRPORT SURFACE NAVIGATION AND TRAFFIC CONTROL

W. L. THOMPSON (Racal Avionics, Ltd., New Malden, England) International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Sept. 1985, p. 171-174.

In order to refine the control of airport surface environments to the same degree as flight environments, ATC calls for ground movement radars currently becoming available with all-weather performance and low capital costs. There remain, however, problems with radio crosstalk, interference, and various emergencies that can endanger ATC operations in a crowded airport. The development of surface navigation systems giving each pilot a visual display of the airport layout is therefore recommended. O.C.

**A86-40229**

### COMPUTERISATION OF AIR INFORMATION SERVICES IN FRANCE

R. WALLE (Service de l'Information Aeronautique, Athis-Mons, France) International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Sept. 1985, p. 188-191, 196.

A development history and performance evaluation account is given of France's computerization of ATC data since 1979. In 1983, an aviation data base was established for the automatic editing of ATC documents and the communication of aeronautical restrictions. Attention is given to the system built for automated processing of notices to airmen, which both receives and transmits data and may be extended to such other functions as flight plan processing and the compilation of meteorological data. O.C.

**A86-40230**

### THE FRENCH AIR TRAFFIC CONTROL SYSTEM TODAY - A PARADOX

J.-P. BERNARD International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Sept. 1985, p. 192-196.

An evaluation is made of those aspects of the French ATC system which appear to be either more sophisticated or more backward than is currently the case in West European countries of comparable economic importance and technological advancement. The French ATC system is noted to suffer from a lack of uniform radar control for en route and approach segments of flight, giving rise to incompatibilities between both systems and working methods at various air control centers and between the centers and airport approaches. Attention is given to the French automatic air traffic coordinator, which is based on a distributed minicomputer architecture. O.C.

**A86-40569**

### RADIO TELEPHONY - A CASE FOR GROWING CONCERN

H. M. VERMEULEN International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Dec. 1985, p. 274-276.

The problems with and recommendations for improving aircraft communications are analyzed. The difficulties encountered in international radio communications due to language differences are discussed. The need to eliminate unnecessary distractions in the cockpit and to reduce verbal communications and traffic on busy frequencies is examined. The role of ICAO in improving aircraft communications and developing a better infrastructure is described. The use of secondary surveillance radar mode-S, which has a digital data link and provides a traffic display for the pilots, and the removal of HF frequencies as the means of civil aircraft communication are proposed as methods for enhancing aircraft communications. I.F.

**A86-40570**

### LANGUAGE PROBLEMS IN AIR TRAFFIC CONTROL

L. F. LEVESON International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Dec. 1985, p. 277-279.

The problems encountered in radio telephony (R/T) communications due to language difficulties are described. It is observed that rapid delivery of information, pronounced accents, and the use of slang and colloquial phrases hinder aircraft communications. The need for pilots and air traffic controllers (ATCs) to speak proper English and precisely utilize R/T phraseology is discussed. It is recommended that English be made the official R/T language, a higher standard of English proficiency stressing pronounciation and phonetics be required of pilots and ATCs, language training should take place in the area the trainee will be operating, and radio traffic be frequently monitored. I.F.

**A86-41335**

### DESIGN TECHNIQUE TO REDUCE EFFECTS OF TIDAL VARIATIONS ON AN ILS GLIDE SLOPE SYSTEM

V. UNGVICHIAN (Florida Atlantic University, Boca Raton) Electronics Letters (ISSN 0013-5194), vol. 22, April 24, 1986, p. 478, 479.

A 330 MHz null-reference glide slope system design technique to minimize the reflecting surface variations is introduced. The runaway approach end of the site selected to test this design is over an ocean. Since the ocean forms part of the reflecting surface of the glide slope system, the tidal variations will affect the glide angle. The uniform theory of diffraction is used in the analysis and calculations are made for five tidal levels from high to low tide. The results of the simulations indicate that a glide path angle exists which is least sensitive to the tidal variations. Furthermore, this optimum angle provides smooth glide path structure. Author

**A86-41873#**

### RUNWAY REQUIREMENTS IN INSTRUMENT FLIGHT TRAFFIC AT REGIONAL AIRPORTS AND COMMERCIAL LANDING AREAS [ANFORDERUNGEN AN LANDEBAHNEN FUER INSTRUMENTENFLUGBETRIEB AUF REGIONALEN VERKEHRSFLUGHAEFEN UND VERKEHRSLANDEPLAETZEN]

Ortung und Navigation (ISSN 0474-7550), vol. 27, no. 1, 1986, p. 5-28. In German. refs

Requirements pertaining to short instrument runways are studied with regard to planning criteria, lighting, and radio-electric navigation and landing aids. It is shown that instrument runways have different safety requirements from runways of large airports. The acceptance of the ICAO Annex 14 has resulted in the considerable lessening of requirements for obstacle-free surfaces, especially in the runways, the landing and takeoff surfaces, and the lateral overflight surfaces. Short instrument runways should have bright lighting at the edges, the front and end, as well as simple approach lighting. Various combinations of radio-electric landing aids are suggested. C.D.

**A86-41874#**

### SOPHISTICATION AND SAFETY IN A SEMI-AUTOMATED AIR TRAFFIC CONTROL SYSTEM

H. VON VILLIEZ (EUROCONTROL, Maastricht, Netherlands) (Royal Institute of Navigation, Meeting, 1st, Amsterdam, Netherlands, Oct. 1985) Ortung und Navigation (ISSN 0474-7550), vol. 27, no. 1, 1986, p. 29-39.

The need for data processing techniques in air traffic control (ATC) is discussed. The basic features of a semiautomated ATC system are: (1) flight path calculation, (2) event determination, (3) code allocation, (4) correlation flight-plan/radar target, (5) strip printing, and (6) ACT-message exchange. The use of a composite radar picture, single and multiradar tracking, a code-callsign correlation, an executive controller message, a short-term conflict alert, and a weather contour map for completing the operational goals of an ATC system is described. The reliability and safety requirements for ATC systems are examined. The four levels of system support include: maintenance, optimization, expansion, and replacement. The applications of mode S operation to secondary surveillance systems, and color displays and voice recognition techniques to ATC are proposed. I.F.

**A86-42966**

**FLIGHTPATH RECONSTRUCTION AND SYSTEMATIC RADAR ERROR ESTIMATION FROM MULTI-RADAR RANGE-AZIMUTH MEASUREMENTS**

J. J. RENES (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands), P. V.D. KRAAN (EUROCONTROL, Brussels, Belgium), and C. EYMANN (EUROCONTROL, Experimental Centre, Bretigny-sur-Orge, France) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 1282-1285. refs

(Contract EUROCONTROL-A0/12/AN/82)

The MURATREC system designed to automatically monitor a complete system of radars and process data in order to produce aircraft reference trajectories is described. The system monitors up to eight radars and produces a data collection of 500,000 position measurements. The measurements are a collection of time, range, azimuth, and height information. The effects of systematic, random, and correlated errors on the MURATREC system are analyzed. The algorithms employed by the system for spline-B approximation are examined; a fast given transformation algorithm is used to compute the B-spline coefficients of the discrete least-squares fit to the uncorrected range and azimuth of the radar plot data. The system is evaluated and it is observed that MURATREC has an attainable absolute position accuracy of about 50 meters, except for steep and fast turns. I.F.

**SITING CRITERIA FOR MICROWAVE LANDING SYSTEMS (MLS) Final Report**

R. RADCLIFF and M. F. DIBENEDETTO Jun. 1986 83 p

(Contract DTRS57-83-C-00097)

(FAA/PM-86/18; OU-AEC-81-1) Avail: NTIS HC A05/MF A01

Current siting criteria for the Microwave Landing System (MLS) are described. These criteria were obtained throught flight testing, mathematical and computer modeling, and publications from other sources. A description of MLS principles and a technical description of each of the systems components are provided. General principles germane to siting, such as critical areas and propagation effects are introduced. The criteria for siting in the MLS in an ideal airport are described. Solutions to difficult siting problems such as MLS/ILS collocation, multipath and shadowing effects, and collocation with approach lighting systems are given. Author

**LOCAL FLOW MANAGEMENT/PROFILE DESCENT ALGORITHM. FUEL-EFFICIENT, TIME-CONTROLLED PROFILES FOR THE NASA TSRV AIRPLANE**

J. L. GROCE, K. H. IZUMI, C. H. MARKHAM, R. W. SCHWAB, and J. L. THOMPSON May 1986 126 p

(Contract NAS1-14880)

(NASA-CR-172593; NAS 1.26:172593) Avail: NTIS HC A07/MF A01 CSCL 17G

The Local Flow Management/Profile Descent (LFM/PD) algorithm designed for the NASA Transport System Research Vehicle program is described. The algorithm provides fuel-efficient altitude and airspeed profiles consistent with ATC restrictions in a time-based metering environment over a fixed ground track. The model design constraints include accommodation of both published profile descent procedures and unpublished profile descents, incorporation of fuel efficiency as a flight profile criterion, operation within the performance capabilities of the Boeing 737-100 airplane with JT8D-7 engines, and conformity to standard air traffic navigation and control procedures. Holding and path stretching capabilities are included for long delay situations. Author

(NASA-CR-177408; NAS 1.26:177408; FAA/PM-86/15; AMA-86-2-II) Avail: NTIS HC A03/MF A01 CSCL 17G

Current approved terminal instrument procedures (TERPS) do not permit the full exploitation of the helicopter's unique flying characteristics. Enhanced TERPS need to be developed for a host of non-standard landing sites and navigation aids. Precision navigation systems such as microwave landing systems (MLS) and the Global Positioning System (GPS) open the possibility of curved paths, steep glide slopes, and decelerating helicopter approaches. This study evaluated the feasibility, benefits, and liabilities of using helicopter cockpit simulators in place of flight testing to develop enhanced TERPS criteria for non-standard flight profiles and navigation equipment. Near-term (2 to 5 year) requirements for conducting simulator studies to verify that they produce suitable data comparable to that obtained from previous flight tests are discussed. The long-term (5 to 10 year) research and development requirements to provide necessary modeling for continued simulator-based testing to develop enhanced TERPS criteria are also outlined. Author

(Contract DTFA01-83-C-20025)

(FAA/PM-86/7.11-VOL-2; OU/AEC/EER-79-1-VOL-2) Avail: NTIS HC A17/MF A01

Evaluations and performance analysis of the Instrument Landing System (ILS) are presented for Dallas-Fort Worth, Tex.; Wheeling, W.V.; Bristol, Tenn.; Parkersburg, W.V.; Pontiac, Mich.; and DeKalb-Peachtree, Ga. An investigation of anomalous performance of the glide slope at Lambert-St. Louis is reported. An analysis of Instrument Landing System (ILS) Reference Datum Heights (RDH) is reported, as well as the results of an investigation of glide slope critical areas. A study into the feasibility of developing ground-based checking techniques for validating the Sideband Reference (SBR) glide slope is presented, as well as an assessment of the current standards and tolerances used to qualify glide slope structures. In addition, a proposed methodology for mathematical model validation is discussed. Author

**N86-28933*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**DESIGN CONSIDERATIONS FOR FLIGHT TEST OF A FAULT INFERRING NONLINEAR DETECTION SYSTEM ALGORITHM FOR AVIONICS SENSORS**
A. K. CAGLAYAN (Charles River Analytics, Inc., Cambridge, Mass.), P. M. GODIWALA, and F. R. MORRELL Aug. 1986 11 p Presented at the Guidance, Navigation, and Control Conference, Williamsburg, Va., 18-20 Aug. 1986
(NASA-TM-88998; NAS 1.15:88998) Avail: NTIS HC A02/MF A01 CSCL 01D

The modifications to the design of a fault inferring nonlinear detection system (FINDS) algorithm to accommodate flight computer constraints and the resulting impact on the algorithm performance are summarized. An overview of the flight data-driven FINDS algorithm is presented. This is followed by a brief analysis of the effects of modifications to the algorithm on program size and execution speed. Significant improvements in estimation performance for the aircraft states and normal operating sensor biases, which have resulted from improved noise design parameters and a new steady-state wind model, are documented. The aircraft state and sensor bias estimation performances of the algorithm's extended Kalman filter are presented as a function of update frequency of the piecewise constant filter gains. The results of a new detection system strategy and failure detection performance, as a function of gain update frequency, are also presented. Author

## 05

## AIRCRAFT DESIGN, TESTING AND PERFORMANCE

Includes aircraft simulation technology.

**A86-40106*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**COMPUTER SIZING OF FIGHTER AIRCRAFT**
P. G. COEN and W. E. FOSS, JR. (NASA, Langley Research Center, Hampton, VA) Journal of Aircraft (ISSN 0021-8669), vol. 23, May 1986, p. 353, 354. Previously announced in STAR as N85-16759. refs
(AIAA PAPER 85-0212)

The computer sizing technique has been applied to a number of military mission profiles. Performance data can be determined for all segments of the selected profile, which typically include takeoff, climb, cruise, loiter, reserve and landing segments. Options are available for detailed calculation of combat performance and energy-maneuverability characteristics. Configuration changes, such as external fuel tank drop and weapon expenditure, can be included in the mission. In the sizing mode, aircraft gross weight, wing loading, and thrust-to-weight ratio are varied automatically to determine which combinations meet the design mission radius. The resulting performance data can be used to create a thumbprint plot. This plot is useful in determining the configuration size that best satisfies the mission and performance requirements. The sizing mode can also be used to perform parametric studies such as sensitivity of gross weight to alternate design conditions. Author

**A86-40113#**
**CTOL SKI JUMP - ANALYSIS, SIMULATION, AND FLIGHT TEST**
J. W. CLARK, JR. and M. M. WALTERS (U.S. Navy, Naval Air Development Center, Warminster, PA) Journal of Aircraft (ISSN 0021-8669), vol. 23, May 1986, p. 382-389.

In the past several years, the ski-jump (ramp-assisted) launch concept has received considerable attention within the U.S. Navy. The specific goal was set (and achieved) to demonstrate through flight test the feasibility of, and quantify performance gains from, ski-jump launch of the T-2C, F-14A, and F/A-18A aircraft using a 100-ft ramp with variable end angles of 6 and 9 degs. The analysis, piloted simulation, performance predictions, and flight safety considerations leading to flight test, as well as a comparison of analytical predictions with flight test results for the three aircraft, are discussed. The developed analytical capability, although somewhat conservative, proved to be highly effective in preparation for, and support of, the flight test and successfully predicting the 40-60 percent reduction in takeoff distance demonstration in flight test. Author

**BEECH'S ENTERPRISING STARSHIP**
G. WARWICK Flight International (ISSN 0015-3710), vol. 129, May 3, 1986, p. 18-24.

The design and development of a new corporate turboprop, the Beech Starship 1, are described. Starship 1 is an eight-to-ten seat business turboprop aimed at the lower end of the business jet market, cruising at up to 41,000 ft and 405 mph (but not simultaneously), with a still-air range of 2250 nautical miles (enough for a nonstop flight across the U.S.), and the ability to operate out of airfields too small for jets. The design features an aft-set swept wing with rudder-equipped winglets for directional control, combined with a slender foreplane - a canard configuration or tandem wing. The airframe is almost entirely composite. Fuel efficiency is claimed to at least 25 percent better than a jet of comparable size. D.H.

**A86-40472**
**NACES - TODAY'S ULTIMATE SEAT**
M. GAINES Flight International (ISSN 0015-3710), vol. 129, May 3, 1986, p. 26-29.

The Martin-Baker Mk.14 Naces (Navy Aircrew Common Ejection Seat) is described. The Naces, to be built by Martin-Baker and produced by a U.S. company to be chosen by Martin-Baker, is to be fitted to A-6E Intruders (the new-build upgraded variant), the F-14D Tomcat, the F-18 Hornet, and the T-45A Goshawk two-seat trainer. The Navy's list of criteria, besides high performance, included low acquisition cost, commonality, ease of production, extreme ease of maintenance, high reliability, low life-cycle costs, minimum program risk, a pre-planned product improvement program for future growth and integrated logistic support. Details of construction (explosive cartridge, electronic sequencer, rocket deployment of parachute, etc.) are covered. It is noted that a safe ejection will be possible from an aircraft with nose level at 130-knot airspeed and 110 feet of altitude, with the aircraft inverted. D.H.

**THE CYCLO-CRANE - A HYBRID AIRSHIP CONCEPT**

J. J. MORRIS (Aerolift, Inc., Tillamook, OR) Airship, Dec. 1985, p. 9-11.

The 'Cyclo-Crane' is an aerostat that incorporates aerodynamic lift and thrust elements in order to furnish heavy lift services comparable to those of the helicopter, though at lower cost. While the Cyclo-Crane demonstration vehicle carries a 2-ton slung payload, its full size version will be capable of operations with 25 tons. Standard aircraft engines are used in what may be characterized as a tip-driven rotor configuration; VTOL capabilities are available with any two of the four engines operating. Forward movement from the hovering position is achieved by altering the pitch of the rotor blade airfoils. O.C.

(Contract NAS3-24544)
(AIAA PAPER 86-1545)

In connection with the significant advances made regarding the performance of larger gas turbines, challenges arise concerning the improvement of small gas turbine engines in the 250 to 1000 horsepower range. In response to these challenges, the NASA/Army-sponsored Small Engine Component Technology (SECT) study was undertaken with the objective to identify the engine cycle, configuration, and component technology requirements for the substantial performance improvements desired in year-2000 small gas turbine engines. In the context of this objective, an American turbine engine company evaluated engines for four year-2000 applications, including a rotorcraft, a commuter aircraft, a supersonic cruise missile, and an auxiliary power unit (APU). Attention is given to reference missions, reference engines, reference aircraft, year-2000 technology projections, cycle studies, advanced engine selections, and a technology evaluation. G.R.

(AIAA PAPER 86-1756)

Methods are presented for estimating some of the more fundamental design variables of single-rotor helicopters (tip speed, blade area, disk loading, and installed power) based on design requirements (speed, weight, fuselage drag, and design hover ceiling). The well-known constraints of advancing-blade compressibility and retreating-blade stall are incorporated into the estimation process, based on an empirical interpretation of rotor performance data from large-scale wind-tunnel tests. Engine performance data are presented and correlated with a simple model usable for preliminary design. When approximate results are required quickly, these methods may be more convenient to use and provide more insight than large digital computer programs. Author

**APPLICATION OF SYSTEM IDENTIFICATION TO AIRCRAFT FLIGHT TEST DATA PROCESSING**

L. C. ANDERSON and J. H. VINCENT (Systems Control Technology, Inc., Palo Alto, CA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 1929-1931.

A parameter identification technique for developing an aerodynamic model of the AV-8B aircraft with flight test data is described. The methods utilized to generate the model parameters, which include cubic spline functions, an equation error technique, and equation error/regression methods, are discussed. The test data was collected from flight maneuver tests involving 23 maneuvers of 30 sec durations. The determination of the model structure is examined. A principal components regression algorithm is applied to the identification of the model parameters. Nonlinear aerodynamic coefficients for yawing moment due to sideslip, yawing moment versus sideslip, rolling moment due to aileron, and rolling moment due to roll rate are identified. The flight test identified model is compared to wind tunnel data and good correlation is detected. I.F.

**LOADS CALIBRATIONS OF STRAIN GAGE BRIDGES ON THE DAST PROJECT AEROELASTIC RESEARCH WING (ARW-2)**

C. V. ECKSTROM Mar. 1986 118 p
(NASA-TM-87677; NAS 1.15:87677) Avail: NTIS HC A06/MF A01 CSCL 01C

Results from and details of the procedure used to calibrate strain gage bridges for measurements of wing structural loads, shear (V), bending moment (M), and torque (T), at three semispan stations on both the left and right semispans of the ARW-2 wing are presented. The ARW-2 wing has a reference area of 35 square feet, a span of 19 feet, an aspect ratio of 10.3, a midchord line sweepback angle of 25 degrees, and a taper ratio of 0.4. The ARW-2 wing was fabricated using aluminum spars and ribs covered with a fiberglass/honeycomb sandwich skin material. All strain gage bridges are mounted along with an estimate of their accuracy by means of a comparison of computed loads versus actual loads for three simulated flight conditions. Author

**NASTRAN/FLEXSTAB PROCEDURE FOR STATIC AEROELASTIC ANALYSIS**

L. S. SCHUSTER Sep. 1984 21 p
(NASA-TM-84897; NAS 1.15:84897) Avail: NTIS HC A02/MF A01 CSCL 01C

Presented is a procedure for using the FLEXSTAB External Structural Influence Coefficients (ESIC) computer program to produce the structural data necessary for the FLEXSTAB Stability Derivatives and Static Stability (SD&SS) program. The SD&SS program computes trim state, stability derivatives, and pressure and deflection data for a flexible airplane having a plane of symmetry. The procedure used a NASTRAN finite-element structural model as the source of structural data in the form of flexibility matrices. Selection of a set of degrees of freedom, definition of structural nodes and panels, reordering and reformatting of the flexibility matrix, and redistribution of existing point mass data are among the topics discussed. Also discussed are boundary conditions and the NASTRAN substructuring technique. Author

**EVALUATION OF LAMINAR FLOW CONTROL SYSTEMS CONCEPTS FOR SUBSONIC COMMERCIAL TRANSPORT AIRCRAFT Final Report**

W. E. PEARCE Jun. 1983 504 p
(Contract NAS1-14632)
(NASA-CR-159251; NAS 1.26:159251; ACEE-01-FR-3132) Avail: NTIS HC A22/MF A01 CSCL 01C

An evaluation was made of laminar flow control (LFC) system concepts for subsonic commercial transport aircraft. Configuration design studies, performance analyses, fabrication development, structural testing, wind tunnel testing, and contamination-avoidance techniques were included. As a result of trade studies, a configuration with LFC on the upper wing surface only, utilizing an electron beam-perforated suction surface, and employing a retractable high-lift shield for contamination avoidance, was selected as the most practical LFC system. The LFC aircraft was then compared with an advanced turbulent aircraft designed for the same mission. This comparison indicated significant fuel savings and reduced direct operating cost benefits would result from using LFC. Author

**APPLICATION OF PARAMETER ESTIMATION TO HIGHLY UNSTABLE AIRCRAFT**

R. E. MAINE and J. E. MURRAY Aug. 1986 14 p Proposed for presentation at the AIAA Atmospheric Flight Mechanics Conference, Williamsburg, Va., 18-20 Aug. 1986
(NASA-TM-88266; H-1365; NAS 1.15:88266; AIAA-86-2020-CP) Avail: NTIS HC A02/MF A01 CSCL 01C

The application of parameter estimation to highly unstable aircraft is discussed. Included are a discussion of the problems in applying the output error method to such aircraft and demonstrates that the filter error method eliminates these problems. The paper shows that the maximum likelihood estimator with no process noise does not reduce to the output error method when the system is unstable. It also proposes and demonstrates an ad hoc method that is similar in form to the filter error method, but applicable to nonlinear problems. Flight data from the X-29 forward-swept-wing demonstrator is used to illustrate the problems and methods discussed. Author

**EFFECTS OF BLADE-TO-BLADE DISSIMILARITIES ON ROTOR-BODY LEAD-LAG DYNAMICS**

M. J. MCNULTY Mar. 1986 31 p
(Contract K-1053)
(NASA-TM-86828; A-85393; NAS 1.15:86828; USAAVSCOM-TM-86-A-3) Avail: NTIS HC A03/MF A01 CSCL 01C

Small blade-to-blade property differences are investigated to determine their effects on the behavior of a simple rotor-body system. An analytical approach is used which emphasizes the significance of these effects from the experimental point of view. It is found that the primary effect of blade-to-blade dissimilarities is the appearance of additional peaks in the frequency spectrum which are separated from the convention response modes by multiples of the rotor speed. These additional responses are potential experimental problems because when they occur near a mode of interest they act as contaminant frequencies which can make damping measurements difficult. The effects of increased rotor-body coupling and a rotor shaft degree of freedom act to improve the situation by altering the frequency separation of the modes. Author

**MIRAGE A3-002 STRAIN RESPONSES TO GROUND CALIBRATION LOADINGS BETWEEN 1978 AND 1985**

M. G. J. HIGGS Dec. 1985 116 p
(AD-A165846; ARL-STRUC-TM-425) Avail: NTIS HC A06/MF A01 CSCL 01C

Prior to flight trials in 1978, a calibration of strain gauges fitted to Mirage A3-002 was carried out by measuring responses to ground loads applied at several locations on the Mirage wing. Since 1978, further ground calibrations have been made on the same aircraft. The loading procedure used was similar to that for earlier ground calibrations of other Mirage aircraft. This technical memorandum provides a record of the output of strain gauges fitted to A3-002, and identifies some trends in these outputs. For some gauges, data is given for a seven-year period. Two loading cases are presented: (1) loading at the main external store attachment point, and (2) loading at the Sidewinder attachment point. The discussion is restricted to strain gauges fitted to wings and to fuselage frame 26. In general, consistent results were obtained over the measurement period. GRA

**COMPUTING CODES FOR DEVELOPMENT OF HELICOPTER CRASHWORTHY STRUCTURES AND TEST SUBSTANTIATION**

J. MENS and J. C. BIANCHINI (Engineering System International, Rungis, France) 1986 14 p Presented at AHS/NAI Intern. Seminar, Nanjing, China, 6-8 Jan. 1985 Sponsored by Direction des Recherches Etudes et Techniques
(SNIAS-861-210-106; ESA-86-97154) Avail: NTIS HC A02/MF A01

Computing tools used in designing crashworthy helicopters are described. The dynamic behavior of components during impact on ground is computed by the KRASH program. The buckling load of panels stiffened by angles, Z-sections, or honeycomb panels, is computed by a purely analytic computer code. The complete buckling and post-buckling behavior of the structure components can be successfully described by the PAM CRASH computer program system, taking account of specific support and contact conditions as well as possible interaction between fluid and structure; the programs use the finite element method in large deformations and the nonlinear behavior of materials. In static or slightly dynamic analyses, an implicit integration scheme is used. For higher velocity impact, an explicit scheme is more effective. Hybridization of the analytical model within an implicit numerical code gives results which are very comparable with a purely numerical calculation, but at lower cost. ESA

**FORMAL OPTIMIZATION OF HOVERING PERFORMANCE USING FREE WAKE LIFTING SURFACE THEORY**

S. Y. CHUNG Feb. 1986 260 p
(Contract NAG2-275)
(NASA-CR-177103; NAS 1.26:177103) Avail: NTIS HC A12/MF A01 CSCL 01C

Free wake techniques for performance prediction and optimization of hovering rotor are discussed. The influence functions due to vortex ring, vortex cylinder, and source or vortex sheets are presented. The vortex core sizes of rotor wake vortices are calculated and their importance is discussed. Lifting body theory for finite thickness body is developed for pressure calculation, and hence performance prediction of hovering rotors. Numerical optimization technique based on free wake lifting line theory is presented and discussed. It is demonstrated that formal optimization can be used with the implicit and nonlinear objective or cost function such as the performance of hovering rotors as used in this report. Author

**IN-FLIGHT THRUST DETERMINATION ON A REAL-TIME BASIS Final Report**
R. J. RAY, T. CARPENTER, and T. SANDLIN Apr. 1984 39 p
(Contract NCC4-1)
(NASA-CR-176997; NAS 1.26:176997) Avail: NTIS HC A03/MF A01 CSCL 01C

A real time computer program was implemented on a F-15 jet fighter to monitor in-flight engine performance of a Digital Electronic Engine Controlled (DEES) F-100 engine. The application of two gas generator methods to calculate in-flight thrust real time is described. A comparison was made between the actual results and those predicted by an engine model simulation. The percent difference between the two methods was compared to the predicted uncertainty based on instrumentation and model uncertainty and agreed closely with the results found during altitude facility testing. Data was obtained from acceleration runs of various altitudes at maximum power settings with and without afterburner. Real time in-flight thrust measurement was a major advancement to flight test productivity and was accomplished with no loss in accuracy over previous post flight methods. Author

E. J. WALSH (NASA, Wallops Flight Center, Wallops Island, VA; NOAA, Propagation Laboratory, Boulder, CO), D. W. HANCOCK, III, D. E. HINES (NASA, Wallops Flight Center, Wallops Island, VA), R. N. SWIFT, and J. F. SCOTT (EG&G Washington Analytical Services Center, Inc., Pocomoke City, MD) IEEE Journal of Oceanic Engineering (ISSN 0364-9059), vol. OE-10, Oct. 1985, p. 376-381. refs

The Surface Contour Radar (SCR) is a 36-GHz computer-controlled airborne radar which generates a false-color-coded elevation map of the sea surface below the aircraft in real time, and can routinely produce ocean directional wave spectra with post-flight data processing which have much higher angular resolution than pitch-and-roll buoys. The SCR range measurements are not error-free and the resulting errors in the elevations corrupt the directional wave spectrum. This paper presents a technique for eliminating that contamination. Author

This report catalogs the aircraft avionics suitable for advanced approach applications. The configuration and model numbers of avionics used in navigation and approaches for landing are provided for 79 different types of aircraft. Aircraft are grouped into five user communities which cover Major Air Carriers, Regional Air Carriers, Executive Jets, General Aviation Aircraft, and IFR Helicopters. Avionics evaluation includes VOR NAVs, ADFs, DMEs, RNAVs, AFCS, weather radar and the associated display instruments. These navigation systems are the most popular units for navigation and landing in todays aircraft. ILS glideslope receivers, marker beacon systems, navigation management systems, vertical navigation systems, and long range navigation systems are not covered. Author

Presented is an advanced, fault-tolerant multiprocessor avionics architecture as could be employed in an advanced rotorcraft such as LHX. The processor structure is designed to interface with existing digital avionics systems and concepts including the Army Digital Avionics System (ADAS) cockpit/display system, navaid and communications suites, integrated sensing suite, and the Advanced Digital Optical Control System (ADOCS). The report defines mission, maintenance and safety-of-flight reliability goals as might be expected for an operational LHX aircraft. Based on use of a modular, compact (16-bit) microprocessor card family, results of a preliminary study examining simplex, dual and standby-sparing architectures is presented. Given the stated constraints, it is shown that the dual architecture is best suited to meet reliability goals with minimum hardware and software overhead. The report presents hardware and software design considerations for realizing the architecture including redundancy management requirements and techniques as well as verification and validation needs and methods. Avail: NTIS HC A06/MF A01

The avionic systems on aircraft being designed by Aeritalia are discussed. The installation of the first European optical fiber system on board a G-22 aircraft of the Italian Air Force is planned. This experiment will be the start of a new phase of study for the installation of a complete optical fiber system on board an advanced aircraft. The Automatic Test Equipment (ATE) is explained. Also discussed is the telematic laser targeting equipment for armored vehicles. Propfan technology is examined. B.G.

**A NEW GENERATION T56 TURBOPROP ENGINE**
W. L. MCINTIRE (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) International Journal of Turbo and Jet-Engines (ISSN 0334-0082), vol. 2, no. 3, 1985, p. 189-197.

The T56 Series IV turboprop development program attempts to improve output power and specific fuel consumption (SFC) while retaining the T56 family's proven design features. Toward these ends, compressor blading efficiency has been increased by 5.6 percent, turbine efficiency has been increased by 2.0 percent, and turbine inlet temperature has been increased by 180 F, yielding a 10.5-percent reduction in SFC and a power output growth of 21 percent over the basic T56 design. Engines of Series IV type will be available in late 1986 for use in U.S. Navy E-2 aircraft, with follow-on application to U.S. Air Force C-130 and Navy P-3 aircraft. The engine will also be applicable to naval vessel propulsion. O.C.

**TURBOMACHINERY PERFORMANCE DETERIORATION; PROCEEDINGS OF THE FOURTH JOINT FLUID MECHANICS, PLASMA DYNAMICS, AND LASERS CONFERENCE, ATLANTA, GA, MAY 12-14, 1986**
W. TABAKOFF, ED. (Cincinnati, University, OH) Conference sponsored by AIAA and ASME. New York, American Society of Mechanical Engineers (Fluids Engineering Symposia Series. Volume FED-37), 1986, 162 p. For individual items see A86-40727 to A86-40740.

Various papers on engine performance deterioration and retention, turbines and compressor erosion, turbomachinery permanent and temporary performance losses, and gas and steam turbines performance deterioration are presented. The topics discussed include: compressor erosion and performance deterioration, response of an operational turbofan engine to a simulated nuclear blast, design features for performance retention in the CFM65 engine, deterioration factors in Rolls-Royce RB211 in-service performance, effect of particle characteristics on trajectories and blade impact pattern, and prediction of fouled compressor performance using stage stacking techniques. Also covered are: dilute gas-particle flow in a centrifugal compressor impeller, particle trajectories in full 3D flow field of turbomachinery, single-stage axial flow compressor performance deterioration, response of axial compressor to distorted inlet flow, clearance effects on heat transfer at the tips of plain and grooved turbine airfoils, effects of water ingestion into jet engine compressors, and liquid drop impact against a solid surface. C.D.

### COMPRESSOR EROSION AND PERFORMANCE DETERIORATION

W. TABAKOFF (Cincinnati, University, OH) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 1-13. refs
(Contract DAAG29-82-K-0029)

Aircraft engines operating in areas where the atmosphere is polluted by small solid particles are typical examples of jet engines operating under hostile atmospheric environment. The particles may be different kinds of sand, volcanic ashes or others. Under these conditions, the gas and particles experience different degrees of turning as they flow through the engine. This is mainly due to the difference in their inertia. This paper presents the results of an investigation of the solid particle dynamics through a helicopter engine with inlet particle separator. The particle trajectories are computed in the inlet separator which is characterized by considerable hub and tip contouring and radial variation in the swirling vane shape. The nonseparated particle trajectories are determined through the deswirling vanes and the five stage axial flow compressor. The results from this study includes the frequency of particle impacts and the erosion distribution on the blade surfaces. Author

### RESPONSE OF AN OPERATIONAL TURBOFAN ENGINE TO A SIMULATED NUCLEAR BLAST

M. G. DUNN, C. PADOVA (Calspan Advanced Technology Center, Buffalo, NY), and R. M. ADAMS (DNA, Alexandria, VA) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 15-24. refs
(Contract DNA001-79-C-0155; DNA001-81-C-0058)

This paper describes the results of a measurement program designed to determine the transient response of an air-breathing propulsion system to simulated nuclear blast waves. A Ludwieg-tube facility, incorporating a driver technique consisting of an activating chamber and a nonfrangible diaphragm, was used to create the required shock waves. Detailed measurements were performed at incident shock overpressures of approximately 6.9, 10.3, 13.8 and 17.2 kPa (1.0, 1.5, 2.0 and 2.5 psi). For each of these overpressures, data were obtained for engine speeds of 0, 80, 90 and 100 percent of maximum speed. Typical results are presented for distortion patterns at the fan face for both an extended bellmouth and a S-shaped inlet at either 0 or 20 deg yaw angle. Author

### DESIGN FEATURES FOR PERFORMANCE RETENTION IN THE CFM56 ENGINE

R. C. PETERSON (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 33-39.

The objective of the program described in this paper was to identify, substantiate and introduce additional design features into the CFM56 engine which will provide longer on-wing engine performance and stability margin retention considering dust ingestion effects. The initial CFM56 engine design already included many features to provide excellent retention characteristics considering other operational effects. This paper describes the initial CFM56 engine performance characteristics in DC-8 service and the design changes made to the engine which resulted in a major improvement in these characteristics. Also described is the extensive ground engine ingestion test program conducted to duplicate the initial DC-8 service results and then to evaluate and substantiate the benefits of the design improvements. ### FACTORS RELATING TO DETERIORATION BASED ON ROLLS-ROYCE RB 211 IN SERVICE PERFORMANCE

J. K. CROSBY (Rolls-Royce, Ltd., Derby, England) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 41-47.

The in-service performance deterioration of an aircraft jet engine is discussed. Some aspects of the economics of deterioration are addressed, stressing the effect of deterioration on excess fuel costs. Design principles to minimize deterioration are discussed, specifying methods to handle dirt deposits, erosion, and rubbing contact. Design techniques for handling the problems caused by temperature differences are considered, especially those that affect seals. Methods of detecting deterioration are discussed, including quantifying the penalty in terms of overall engine/aircraft performance loss, usually in terms of increased fuel consumption, and identifying the components responsible for the penalty. C.D.

### EFFECT OF PARTICLE CHARACTERISTICS ON TRAJECTORIES AND BLADE IMPACT PATTERNS

A. HAMED (Cincinnati, University, OH) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 49-58. DOE-supported research. refs
(Contract DAAG29-82-K-0029)

This work presents the results of a detailed study of the effect of particle characteristics on the particle dynamics and on the resulting pattern of blade impacts in a two stage axial flow gas turbine operating with particle laden flows. The particle dynamics computations combine particle-blade impact characteristics, as determined from a three dimensional trajectory analysis with particle rebound characteristics, which are obtained from experimental data. The results show the pattern and blade impacts in all stationary and rotating blade rows for fly ash and for sand particles. The results demonstrate that drastically different patterns of particle blade impacts are associated with different particles. Author

### PREDICTION OF FOULED COMPRESSOR PERFORMANCE USING STAGE STACKING TECHNIQUES

H. I. H. SARAVANAMUTTO (Carleton University, Ottawa, Canada) and A. N. LAKSHMINARASIMHA IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 59-66. NSERC-supported research. refs

The importance of compressor fouling effects on gas turbine operation is summarised. An axial multi-stage compressor performance prediction model for the simulation of the effects of fouling is described, and results for various types of fouling simulated for an actual compressor configuration are presented. Author

**A86-40735#**

### STUDY OF SINGLE STAGE AXIAL FLOW COMPRESSOR PERFORMANCE DETERIORATION

W. TABAKOFF (Cincinnati, University, OH) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 95-100.
(Contract DAAG29-82-K-0029)

An investigation carried out on a single stage axial flow compressor to study the effect on performance deterioration of erosion due to operation in an atmosphere polluted by solid particles is reported. The experimental unit is described, including the drive unit, the test compressor, the particle feeding mechanism, and the instrumentation. The test procedure is summarized, and the results are analyzed. It is found that erosion damage can lead to significant reduction in engine efficiency and performance. The performance reduction is due mainly to changes in the blade leading and trailing edges, tip leakages, surface roughness, and pressure distribution. The data obtained from trajectory calculations are in very good agreement with the experimental findings. C.D.

### EXPERIMENTAL AND NUMERICAL STUDY OF THE RESPONSE OF AN AXIAL COMPRESSOR TO DISTORTED INLET FLOW

G. BILLET, J. HUARD, P. CHEVALIER, and P. LAVAL (ONERA, Chatillon-sous-Bagneux, France) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 101-106. refs

A model representing the response of fixed or rotating axial compressor blade-rows is coupled to a 3-D numerical simulation of the flow outside the blade rows. The code can be used to study non-uniform compressible 3D flows through turbomachines. The fluid is assumed to be inviscid in the space outside the rows, while the viscous effects are taken into account inside. Numerical results are compared with steady distorted inflow. This comparison shows that this numerical approach is able to predict the response of the compressor. This work is part of a larger project aimed at predicting the response of a compressor to a nonuniform inlet flow that is periodic in time, or fully unsteady. Author

### CLEARANCE EFFECTS ON HEAT TRANSFER AT THE TIPS OF PLAIN AND GROOVED TURBINE AIRFOILS

D. E. METZGER and M. K. CHYU (Arizona State University, Tempe) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 107-113. refs

Heat transfer from the hot working gases and the resulting temperature levels and gradients at the tips of axial turine blades are important factors affecting service life and possible performance deterioration in gas turbine engines. Until very recently, there was little quantitative information available on blade tip heat transfer for even simple plain flat tips and a near total absence of knowledge of the nature of the convective heat transfer mechanisms involved. The evolution of various tip geometrical treatments, such as grooving, has been based largely on trial and error rather than on an understanding of the phenomena involved. The status of present knowledge on plain tip heat transfer is discussed, and results from an experimental and numerical study of grooved tip geometries are presented. Grooving is shown to be either beneficial or detrimental from the standpoint of total tip heat transfer, depending on the groove geometry. Author

### PERFORMANCE DETERIORATION DURING ROTATING STALL IN AXIAL COMPRESSORS

P. B. SHARMA (Indian Institute of Technology, New Delhi, India), J. W. RAILLY (Birmingham, University, England), and D. T. PAPAGEORGIOU IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 115-122. Research supported by Rolls-Royce, Ltd. refs

Experiments on three axial compressors having hub-tip ratios of 0.4, 0.66 and 0.71 are reported to illustrate the effects of various parameters such as rotor stagger, aspect ratio, hub tip ratio and the exit boundary condition on the level of pressure rise to which the compressor operation deteriorates at occurrence of rotating stall. It has been found that the pressure rise during stall varies with the above factors. The continuance of full span rotating stall to low blockage values of 6-15 percent is found to be associated with the overlap between stalled and unstalled characteristics. Hysteresis and overlap both are found to vary with hub-tip ratio and aspect ratio. Author

### DIRECT AND SYSTEM EFFECTS OF WATER INGESTION INTO JET ENGINE COMPRESSORS

S. N. B. MURTHY, C. M. EHRESMAN, and T. HAYKIN (Purdue University, West Lafayette, IN) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 127-141. NASA-FAA-supported research. refs

Water ingestion into aircraft-installed jet engines can arise both during take-off and flight through rain storms, resulting in engine operation with nearly saturated air-water droplet mixture flow. Each of the components of the engine and the system as a whole are affected by water ingestion, aero-thermally and mechanically. The greatest effects arise probably in turbo-machinery. Experimental and model-based results (of relevance to 'immediate' aerothermal changes) in compressors have been obtained to show the effects of film formation on material surfaces, centrifugal redistribution of water droplets, and interphase heat and mass transfer. Changes in the compressor performance affect the operation of the other components including the control and hence the system. The effects on the engine as a whole are obtained through engine simulation with specified water ingestion. The interest is in thrust, specific fuel consumption, surge margin and rotational speeds. Finally two significant aspects of performance changes, scalability and controllability, are discussed in terms of characteristic scales and functional relations. Author

### SUBSTANTIATION OF REGIMES FOR ACCELERATED EQUIVALENT TESTS OF GAS-TURBINE AEROENGINES [OBOSNOVANIE REZHIMOV USKORENNYKH EKVIVALENTNYKH ISPYTANII AVIATSIONNYKH GTD]

L. P. LOZITSKII, A. N. VETROV, and V. F. LAPSHOV (Kievskii Institut Inzhenerov Grazdanskoi Aviatsii, Kiev, Ukrainian SSR) Problemy Prochnosti (ISSN 0556-171X), April 1986, p. 73-77. In Russian. refs

After reviewing existing approaches to accelerated testing of gas-turbine aeroengines, a method is suggested for calculating equivalent accelerated test regimes. The method is based on a linear mathematical model expressing the engine's service life. The method provides simultaneous verification of service life for some structural engine elements. It is used to calculate the regimes for testing the service times of the turbine blade, the rotor bearing, and the compressor blade. It is also used to calculate the resonance regimes involving tests of the engine's dynamic durability. I.S.

### FLIGHT EFFECTS ON NOISE FROM COAXIAL DUAL FLOW. II - HEATED JETS

R. DASH (NASA, Ames Research Center, Moffett Field, CA) AIAA Journal (ISSN 0001-1452), vol. 24, June 1986, p. 940-947. refs (Contract NCC2-75)

This paper is a continuation of the study described in Part I and deals with the flight effects on noise from heated jets. The present work shows that coaxial exhaust flows with inverted profiles are much quieter than flows with conventional profiles. Among all possible coaxial configurations with only one of the streams heated conventional profile, inverted profile, and the variable stream control engine (VSCE) cycle - and holding constant mass flow and thrust, a VSCE cycle is the best possible engine cycle as it provides over 18-dB reduction in sound pressure level (as compared to noise from a conventional profile cycle) at all angles, both statically and in flight. The study also indicates that, if both the coaxial streams are heated unequally, a duct-burning profile, combined with the variable stream control engine (DB-VSCE) concept, gives rise to a powerful coaxial device which generates the least noise, both statically and in flight. This concept will be of paramount importance as one of the most variable nozzle designs of the future. Author

**DEVELOPMENT OF 'CADEGA' CAD SYSTEM FOR AERO ENGINE DESIGN**

I. KATSUMATA, T. FURUHASHI, J. TAKANO, Y. ISHIKAWA, and T. TAKAHASHI Ishikawajima-Harima Engineering Review (ISSN 0578-7904), vol. 26, March 1986, p. 136-140. In Japanese, with abstract in English.

This paper introduces the CADEGA (Computer Aided Design for Engine General Arrangement) system which is instrumental in aero engine development. Questions were addressed with regard to what CAD can do for engine design, how to introduce CAD, how to implement a new CAD system, and problems related to the present design. Some of the computer programs which have been developed to make this CAD system more effective are explained in detail. This CADEGA system consists of a stacking program which can automatically produce drawings of general engine arrangements through stacking instruction using the CAD data base called master profiles. CADEGA is fully applied to the V2500 Engine design and all the detailed design information is exchanged among parties (five nations in international collaboration) using the CAD data given from this system. **AIR TURBINE TEST RESULTS FOR THREE TURBINE STAGES WITH VARYING RADIAL DISTRIBUTION OF CAMBER**

T. C. FLAHERTY and A. C. GOMINHO (General Electric Co., Aircraft Engine Business Group, Lynn, MA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 7 p.

(AIAA PAPER 86-1467)

Three high pressure ratio turbine stages were designed and tested, having different radial distributions of blading camber in both stator and rotor. The three turbines were designed to the same thermodynamic conditions, with radial distribution of throat area being given three variations: (1) approximately linear ('conventional' design); (2) open at mid-span and closed at hub and tip relative to conventional ('over-cambered'); and (3) closed at mid-span and opened at hub and tip ('de-cambered'). In order to make the radial camber distribution the only variable in the test series, axial width of the blading was varied radially so that all three designs would have the same radial distribution of Zweifel coefficient. The turbines were tested in a warm air facility with conventional fixed instrumentation and with traversing of the exit annulus by a five-hole probe. The over-cambered and de-cambered designs had lower efficiency than the conventional design. Stage exit survey results are presented as well as overall efficiency comparisons. The exit survey results include radial velocity components, and are presented in contour plots as well as radial plots of average quantities. Author

**COUNTER-ROTATION PROP-FAN OPTIMIZATION**

R. E. OWENS, W. W. FERGUSON (United Technologies Corp., Engineering Div. East Hartford, CT), and D. M. MABEE (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 13 p. refs

(AIAA PAPER 86-1470)

An analytical study was conducted to find the best counter-rotation Prop-Fan to power a 120-passenger transport aircraft with aft-mounted engines. Figures-of-merit used in this study were fuel burn, direct operating cost, and noise. Propfan variables studied were number of blades, tip speed, diameter, and activity factor. The effects of these parameters on the performance, weight, and cost of the Prop-Fan were estimated. These estimates were then used to determine propulsion system (including gearbox, engine, nacelle, and pylon) weight, cost, and performance. Influence coefficients were used to determine the effect of these on airplane fuel burn and direct operating cost. The effects of Prop-Fan diameter and weight on airplane configuration and tail size were also included in this analysis. A matrix of 144 Prop-Fans was evaluated in this manner. A number of specific cases were chosen from this matrix for FAR 36 far field (community) and near field (cabin) noise evaluation. Author

**A86-42660#**

**TURBOPROP AND OPEN ROTOR PROPULSION FOR THE FUTURE**

J. H. R. SADLER (Rolls-Royce, Ltd., Derby, England) and G. S. HODGES (Rolls-Royce, Ltd., Bristol, England) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p.

(AIAA PAPER 86-1472)

The factors which influence operating cost of turboprop and open rotor propulsors are shown to vary with the engine application, leading to different optimum design solutions for different aircraft. Generalised relationships between turboprop aircraft design range, power requirements and operating costs breakdown are drawn, showing their influence on both thermodynamic cycle selection and individual component design. The changing effects of physical size on engine layout are also considered, together with the constraints of different engine installations. Conclusions are related to actual design exercises carried out for engines with power outputs ranging from 2000 to 12000 shp. Author

**A86-42662#**

**TURBOFAN AND PROPFAN AS BASIS FOR FUTURE ECONOMIC PROPULSION CONCEPTS**

H. GRIEB and D. ECKARDT (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 13 p.

(AIAA PAPER 86-1474)

While such advanced airliner powerplant configurations as the counterrotating propfan promise considerable reductions in fuel consumption, their integration into aircraft poses design configuration problems requiring a fundamental reorientation. It is noted that the noise from single and counterrotation propfans leads to cabin noise level increases in wing-mounted engine configurations, as well as to structural problems involving center of gravity and maneuverability in the case of tail-mounted engines (which are more suitable with respect to cabin noise). Attention is presently given to a counterrotating shrouded fan, which synthesizes the advantages of turbofan and propfan engines to yield a configurationally optimal design. O.C.

**A86-42672#**

**TURBINE AIRFOIL LCF LIFE PREDICTION VERIFICATION**

F. O. SOECHTING (United Technologies Corp., Engineering Div., West Palm Beach, FL) and R. J. ALLEN (USAF, Wright Aeronautical Laboratory, Wright-Patterson AFB, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 8 p.
(AIAA PAPER 86-1496)

An improved turbine airfoil low cycle fatigue (LCF) life prediction model is evaluated. Core engine tests were conducted in a LCF test facility to provide complete characterization of steady-state and transient environments. The procedure for verifying the airfoil metal temperature distribution predictions on a turbine airfoil are described; the internal and external heat transfer features are examined. The cooling design for the blade is discussed. The distribution of film effectiveness on the airfoil surface is predicted. The relation between the external heat transfer coefficient and the distribution of adiabatic wall temperature is analyzed. The airfoil metal temperature for thermal fatigue life predictions is verified. The LCF model considers the temperature and stress or strain range by utilizing thermal-mechanical fatigue test data for the super-alloys. It is noted that the LCF life mode and heat transfer model provide accurate prediction of the location of turbine airfoil crack initiation and a good estimate of LCF capability. I.F.

**A86-42694#**

**ALTITUDE IGNITION/LEAN DECELERATION STUDY**

J. R. TAYLOR and S. K. WIDENER (General Electric Co., Evendale, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p.
(AIAA PAPER 86-1530)

Combustor lean ignition and flame stability limits are prime considerations in the design of advanced turbine engines. The physical processes governing ignition and blowout are well understood qualitatively, but are not easily modeled or predicted. This paper presents ignition and blowout correlations for seven General Electric combustor designs. The purely empirical relations illustrate the lack of consistent trends from one design to the next; the influence of operating parameters cannot be generalized using current information. The empirical approach presented here is useful for analyzing performance of a given combustor design and provides important information regarding trends with operating variables. Author

**DEVELOPMENT OF THE BOEING 767 THRUST REVERSER**

J. JACKSON (Boeing Commercial Airplane Co., Seattle, WA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 7 p.
(AIAA PAPER 86-1536)

The Boeing 767 is a twin engine wide bodied commercial airplane powered by either Pratt and Whitney JT9D, or General Electric CF6 turbofan engines. This paper describes the development of the Boeing thrust reverser for the 767 airplane from configuration development to FAA certification. Unless otherwise stated the contents of this paper apply to both JT9D and CF6 installations. The requirements of the thrust reverser, together with details of each phase of development in meeting the requirements are presented. Particular attention is directed at Boeing's first use of Turbo Powered Simulator nacelles for wind tunnel thrust reverser model testing and the advantage of this technique over more conventional blowing nacelle models. Finally, in-service experience and reliability together with resolutions of associated problems are discussed. Author

**DYNAMIC PRESSURE LOADS ASSOCIATED WITH TWIN SUPERSONIC PLUME RESONANCE**

J. M. SEINER, J. C. MANNING (NASA, Langley Research Center, Hampton, VA), and M. K. PONTON (PRC Kentron International, Hampton, VA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. refs
(AIAA PAPER 86-1539)

The phenomenon of twin supersonic plume resonance is defined and studied as it pertains to high level dynamic loads in the inter-nozzle region of aircraft like the F-15 and B1-A. Using a 1/40th scale model twin jet nacelle with powered choked nozzles, it is found that intense internozzle dynamic pressures are associated with the synchrophased coupling of each plume's jet flapping mode. This condition is found most prevalent when each plume's jet flapping mode has constituent elements composed of the B-type helical instability. Suppression of these fatigue bearing loads was accomplished by simple geometric modifications to only one plume's nozzle. These modifications disrupt the natural selection of the B-type mode and thereby decouple the plumes. Author

**ROTORCRAFT PROPULSION FOR YEAR 2000 PLUS**

T. R. LARKIN, D. V. STATON, and H. C. MONGIA (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 6 p. Army-supported research.
(Contract NAS3-24542)
(AIAA PAPER 86-1543)

The objective of this study was to identify high-payoff technologies for year 2000 small gas turbine engines for rotorcraft application. A current state-of-the-art technology Allison gas turbine engine was used as a baseline and three advanced concepts were studied: the simple cycle engine, a waste heat recovery cycle, and a wave rotor engine cycle. For the simple cycle engine, two general arrangements were considered: the traditional concentric spool arrangement and a nonconcentric spool arrangement. Both a regenerative and a recuperative cycle were studied for the waste heat recovery cycle. An extensive cycle optimization procedure was performed for each configuration under study using relative direct operating cost (DOC) as the figure of merit. A high pressure ratio nonconcentric engine provided the greatest reduction in DOC with a 16.5 percent improvement. Author

**SMALL ENGINE TECHNOLOGY PAYOFFS FOR FUTURE COMMUTER AIRCRAFT**

H. KAEHLER and W. SCHNEIDER (Avco Lycoming Textron, Stratford, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 12 p. Army-supported research.
(Contract NAS3-24545)
(AIAA PAPER 86-1544)

High payoff technologies for a year 2000 regenerative cycle turboprop engine were identified for a 19 passenger commuter aircraft application. A series of engines incorporating eight levels of advanced technologies were studied and their impact on aircraft performance was evaluated. Four advanced technologies are recommended to achieve a potential reduction in fuel burn of 38.3 percent. At $1.00 per gallon fuel price, a potential direct operating cost (DOC) benefit of 12.5 percent is obtained. At $2.00 per gallon, the potential DOC benefit increases to 17.0 percent. Author

### A REPORT ON THE INITIAL TESTING OF THE LARGE SCALE ADVANCED PROP-FAN

C. L. DEGEORGE, J. E. TURNBERG, and H. S. WAINAUSKI (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p.
(AIAA PAPER 86-1551)

It is pointed out that the Large Scale Advanced Prop-Fan (LAP) represents the culmination of over ten years of effort to extend the operating envelope of the propeller from the .6 Mn levels attained by contemporary turboprop powered aircraft to the .8 Mn speeds of today's turbofan powered commercial airliners. The efficiency of the Prop-Fan should make it possible to design aircraft which are 15 percent to 25 percent more efficient than today's technologically most advanced turbofan powered airliners. A report is presented regarding the initial testing conducted under the LAP program. Attention is given to a description of the LAP, the instrumentation system, aspects of whirl rig testing, and the static rotor test. No barriers were discovered which would prevent a continuation of the studies with wind tunnel, engine, and flight test programs in 1986 and 1987. G.R.

### COMPUTATIONAL MODELS FOR THE ANALYSIS/DESIGN OF HYPERSONIC SCRAMJET COMPONENTS. I - COMBUSTOR AND NOZZLE MODELS

S. M. DASH, N. SINHA, D. E. WOLF, and B. J. YORK (Science Applications International Corp., Propulsion Gas Dynamics Div., Princeton, NJ) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 20 p. refs
(Contract NAS1-16535)
(AIAA PAPER 86-1595)

An overview of computational models developed for the complete, design-oriented analysis of a scramjet propulsion system is provided. The modular approach taken involves the use of different PNS models to analyze the individual propulsion system components. The external compression and internal inlet flowfields are analyzed by the SCRAMP and SCRINT components discussed in Part II of this paper. The combustor is analyzed by the SCORCH code which is based upon SPLITP PNS pressure-split methodology formulated by Dash and Sinha. The nozzle is analyzed by the SCHNOZ code which is based upon SCIPVIS PNS shock-capturing methodology formulated by Dash and Wolf. The current status of these models, previous developments leading to this status, and, progress towards future hybrid and 3D versions are discussed in this paper. Author

### A NOZZLE DESIGN ANALYSIS TECHNIQUE

J. J. BROWN (Boeing Commercial Airplane Co., Seattle, WA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs
(AIAA PAPER 86-1613)

A method for calculating the flowfield in propulsive nozzles is presented. The complete set of partial differential equations for time-dependent, compressible, viscous flow is solved using an efficient numerical procedure. The flowfield is subdivided into rectangular regions called cells. The fluxes of conserved properties (mass, momentum, and energy) into each cell are balanced using a finite-volume approach. Solid boundary conditions are enforced using an imaginary row of cells inside the body. The inflow and outflow boundary conditions are enforced using a method of characteristics formulation. The method uses the line Gauss-Seidel implicit technique of MacCormack to solve the Reynolds-averaged Navier-Stokes equations in the computational domain. The Baldwin-Lomax algebraic turbulence model is used to include the subgrid effects of turbulence. Multistream, axisymmetric nozzle flowfields, including mixing of the streams, can be analyzed using this method. A fan nozzle thrust reverser can be analyzed as well. Results are presented for a converging-diverging propulsive nozzle, a three-stream turbofan nozzle, and a turbofan nozzle with thrust reverser. The computational results show excellent agreement with the experimental data. A two-order of magnitude reduction in run cost relative to the MacCormack explicit method is demonstrated. Author

### TRANSIENT ENGINE PERFORMANCE WITH WATER INGESTION

T. HAYKIN and S. N. B. MURTHY (Purdue University, West Lafayette, IN) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 21 p. refs
(Contract NAG3-481)
(AIAA PAPER 86-1621)

The immediate effects on the transient performance of a generic, high bypass ratio jet engine on account of water ingestion are discussed. The air compression subsystem has been analyzed with respect to four aerothermodynamic and mechanical processes associated with two-phase fluid flow and the engine simulation has been carried out under three limiting cases of interest in practice, one pertaining to draining of water at the end of compression and the other two, to partial evaporation at two different locations in the burner. General observations are made on engine operability as a function of engine and control design under various engine and (control input) sensor operating conditions, with various mass fractions of water in the air-water mixture entering the engine, during various pilot-initiated power demand changes. Author

**A86-42757#**

### SMALL TURBOSHAFT/TURBOPROP ENGINE TECHNOLOGY STUDY

R. HIRSCHKRON and C. J. RUSSO (General Electric Co., Lynn, MA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p.
(AIAA PAPER 86-1623)

A study was conducted on turboshaft/turboprop engines in a nominal 850 shp size to determine advanced technology payoff in typical aircraft missions. Payoff was evaluated vs a reference engine based on current technology. The results indicate worthwhile areas of development in compressor and turbine aerodynamic viscous codes, ceramic composite materials, and advanced ceramic recuperators. An advanced simple cycle engine could demonstrate a 20 percent fuel saving and a 24 percent life cycle cost (LCC) reduction vs current engines. An advanced recuperative engine increases the fuel reduction potential to 37 percent, but with a smaller LCC improvement. An engine incorporating far term, post year 2000 technologies could reach fuel savings reductions of 50 percent. Author

**A86-42758#**

### SMALL ENGINE PROPULSION READINESS FOR THE 21ST CENTURY

J. A. ALCORTA (United Technologies Corp., Pratt and Whitney, West Palm Beach, FL) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 8 p.
(AIAA PAPER 86-1624)

Attention is given to advanced component technologies that can impart significant performance improvements to small turbine engines, such as may be applied to land vehicles, cruise missiles, helicopters, private aircraft and auxiliary power units. These technologies, which encompass modified compressor blading, ceramic combustors, actively cooled radial inflow turbines, advanced Ti alloys, intermetallic materials, and improved bearings, can when integrated yield 20-30 percent reductions in fuel consumption while improving specific power by 50 percent over current comparable engines. O.C.

**A86-42759#**

### PROPFAN TEST ASSESSMENT (PTA) QUICK ENGINE CHANGE (QEC) NACELLE

T. BRADLAUGH-DREDGE (Rohr Industries, Inc., Chula Vista, CA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 6 p.
(AIAA PAPER 86-1626)

A flightworthy Quick Engine Change (QEC) nacelle consisting of upper, lower inlet nose and side cowl composite components mating with internal aluminum frames of steel V braces developed for NASA's Propfan Test Assessment (PTA) program. Loads imposed by the propfan, gearbox and power section of the drive system are transmitted through the gearbox mounts to the forward metallic frames and intercostals, and are then carried aft to the airframe interface through the upper and lower composite cowl panels and via the metallic V brace assemblies. P-3 common hardware was used whenever possible, and design considerations led to the evolution of a hybrid structure design combining external graphite epoxy composite cowling with P-3 common conventional metallic internal structure. Structural design analysis substantiation and critical structural element static and fatigue composite subelement tests were performed. R.R.

**A86-42784#**

### DESIGN FOR ENGINE SUPPORTABILITY

F. C. GILLETTE, T. J. CHRISTIE, W. H. QUIGLEY, and J. M. SHIPMAN (United Technologies Corp., Engineering Div., West Palm Beach, FL) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p.
(AIAA PAPER 86-1671)

Advanced weapon systems require greatly improved supportability to provide the levels of availability and readiness required to counter the emerging threat. This paper addresses a new design approach which has been implemented to ensure supportability. Supportability must be addressed early in the development cycle when it is most cost-effective to implement. The key elements of this new approach are a designer 'awareness' program, supportability reviews, comprehensive trade studies, early support tool involvement, and a full-scale engine mockup built early in the program. These changes in the design process have provided designers with an awareness of current engine maintenance and support concerns. Moreover, it has instilled a disciplined approach to resolve these issues on the next-generation fighter engine. The paper concludes with a discussion of how this new design approach benefits the user and the weapon system. Author

### A FAULT-TOLERANT 1750A ENGINE CONTROLLER

S. NELSON, W. STANTON, and J. VOLP (Charles Stark Draper Laboratory, Inc., Cambridge, MA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p.
(AIAA PAPER 86-1675)

Jet engine control is in a state of transition from traditional passive, hydro-mechanical to electronic. While actuation will remain hydro-mechanical, next generation engine controllers will most certainly be electronic and fault tolerant. This paper develops the rationale for fault-tolerant engine controllers. System trade-offs necessary to determine the appropriate level of redundancy are described, various fault-tolerant computer architectures are compared, and a 1750A fault-tolerant computer that was developed as a prototype for next generation engine control along with some of the lessons learned from that project are described. Author

### TEST AND EVALUATION OF THE HIDEC ENGINE UPTRIM ALGORITHM

R. J. RAY and L. P. MYERS (NASA, Flight Research Center, Edwards, CA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs
(AIAA PAPER 86-1676)

The highly integrated digital electronic control (HIDEC) program will demonstrate and evaluate the improvements in performance and mission effectiveness that result from integrated engine-airframe control systems. Performance improvements will result from an adaptive engine stall margin mode, a highly integrated mode that uses the airplane flight conditions and the resulting inlet distortion to continuously compute engine stall margin. When there is excessive stall margin, the engine is uptrimmed for more thrust by increasing engine pressure ratio (EPR). The EPR uptrim logic has been evaluated and implemente into computer simulations. Thrust improvements over 10 percent are predicted for subsonic flight conditions. The EPR uptrim was successfully demonstrated during engine ground tests. Test results verify model predictions at the conditions tested. Author

### ADVANCES IN AERO ENGINE DYNAMICS

J. B. WYNNE (Rolls-Royce, Ltd., Filton, England) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 12 p. Research supported by the Ministry of Defence (Procurement Executive).
(AIAA PAPER 86-1677)

An account is given of state-of-the-art methods for aircraft turbine engine dynamic balancing at the design and design-verification stages; these are based on FEMs, in the case of engine models, and finite difference time-stepping, in the case of dynamic response prediction. Attention is given to the effects of such operational circumstances as the loss of blading through foreign object ingestion, the characteristics of squeeze film bearings, and the measurement and monitoring of engine vibration. The function of alarm levels, bearing alignment principles, and diagnostic methods are discussed. O.C.

**A86-42789#**

### KNOWLEDGE-BASED SYSTEMS FOR ROTORDYNAMIC DIAGNOSTICS

B. B. AGGARWAL, J. C. GIORDANO (Mechanical Technology, Inc., Latham, NY), and S. J. PRZYBYLKO (USAF, Aero Propulsion Laboratory, Wright-Patterson AFB, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 8 p.
(Contract F33615-85-C-2513)
(AIAA PAPER 86-1678)

The knowledge-based systems considered differ from traditional systems in that the knowledge base is separate from the decision-making logic of the program. Such a separation makes it possible to handle problems of much larger scope and complexity. The investigation described represents the first step in an effort concerned with the application of this technology to the turbine engine domain. Attention is given to gas turbine engine rotor diagnostics, the demonstration of a knowledge-based diagnostic system, a rotordynamic test rig, aspects of data acquisition, and a knowledge-based rotor diagnostic system. The detection of faults implanted in a laboratory test rig provided a successful demonstration of a knowledge-based rotordynamic diagnostic system. G.R.

**AN OVERVIEW OF USAF ENGINE DIAGNOSTIC SYSTEMS**

S. J. THORNTON (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 11 p. refs

(AIAA PAPER 86-1679)

A development history is presented for the U.S. Air Force's engine diagnostic systems, with attention to the automation of diagnostics first introduced in the F100 turbofan engine's Events History Recorder. Other efforts have involved the T-38 trainer's J85 turbojet Engine Health Monitoring System, the A-10 ground support aircraft's TF34 turbofan Turbine Engine Monitoring System, and the F-15 fighter's F100 turbofan Engine Diagnostics System. State-of-the-art systems are currently installed in the KC-135, B-1B, and F-16 aircraft. The Integrated Turbine Engine Monitoring System and Joint Advanced Fighter Engine diagnostic system (for the Advanced Tactical Aircraft), which are undergoing development are also discussed. O.C.

M. A. CHAPPELL (Sverdrup Technology, Inc., Arnold Air Force Station, TN) and E. G. BLEVINS (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. USAF-sponsored research. refs

(AIAA PAPER 86-1731)

The Advanced Turbine Engine Simulation Technique (ATEST) is digital computer simulation system for the prediction and correlation of both steady-state and transient engine performance. ATEST has been developed using both a modular concept which provides the flexibility to simulate arbitrary engine cycle configurations and a modified Newton-Raphson numerical method (matrix solver) to achieve convergence at both design and off-design operating points. In addition, ATEST has the capability to treat the specialized characteristics of a particular engine (turbine cooling air paths, Reynolds number effects, etc.) to the degree of detail required by the user. The technique has been developed around a collection of the best features of current advanced engine simulations used in government and industry. ATEST is intended for aircraft gas turbine engine cycles (e.g., single-spool turbojet, high-bypass turbofan, variable-cycle engine, etc.) but could also be used to simulate other physical systems, taking advantage of the modular structure. The ATEST has been successfully applied to a number of different turbine engine cycles. These cycles represent a wide spectrum of the different types of aircraft gas turbine engines and include a single-spool turbojet (J79), a dual-spool turbojet (J57), dual-spool mixed-flow turbofans (F100, F110, F109, F404), a dual-spool separate-flow turbofan (CFM56), a turboshaft engine (T64), and an unconventional cycle engine. The ATEST has been written in FORTRAN 77 and has been executed on a variety of digital computers, including the AMDAHL 5860, CRAY-XMP, and CYBER 7600. Author

**IMPROVED COMPRESSOR PERFORMANCE USING RECESSED CLEARANCE (TRENCHES) OVER THE ROTOR**

D. C. WISLER and B. F. BEACHER (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. refs

(Contract F33615-81-C-2030)

(AIAA PAPER 86-1745)

A systematic investigation of the effects on compressor performance of recessing (trenching) the case over the rotor tips was conducted in a four-stage research compressor. Variations in the slope of the trench, the depth of the trench, rotor tip penetration into the trench, distances of start and termination of the trench relative to the blade edges, and rotor tip clearances were evaluated. The effects of each geometric parmeter upon compressor efficiency and stall margin were determined. An innovative sloped trench configuration was developed and found to be superior to any other trench configuration tested, giving in one case a 0.5 point improvement in efficiency without adversely affecting stall margin. Author

The concept of a variable cycle turbofan engine with an axially supersonic fan stage as powerplant for a Mach 2.7 supersonic transport was evaluated. Quantitative cycle analysis was used to assess the effects of the fan inlet and blading efficiencies on engine performance. Thrust levels predicted by cycle analysis are shown to match the thrust requirements of a representative aircraft. Fan inlet geometry is discussed and it is shown that a fixed geometry conical spike will provide sufficient airflow throughout the operating regime. The supersonic fan considered consists of a single stage comprising a rotor and stator. The concept is similar in principle to a supersonic compressor, but differs by having a stator which removes swirl from the flow without producing a net rise in static pressure. Operating conditions peculiar to the axially supersonic fan are discussed. Geometry of rotor and stator cascades are presented which utilize a supersonic vortex flow distribution. Results of a 2-D CFD flow analysis of these cascades are presented. A simple estimate of passage losses was made using empirical methods. Author

Avail: NTIS HC A05/MF A01 CSCL 21E

A variable area radial turbine with a moveable nozzle sidewall was experimentally evaluated. The turbine was designed for an advanced variable capacity gas turbine rotorcraft engine. The turbine has a mass flow rate of 2.27 kg/sec (5.0 lbs/sec), and a rotor inlet temperature of 1477K (2200 F). Testing was conducted at a reduced inlet temperature, but the aerodynamic parameters and Reynolds numbers were duplicated. Overall performance was obtained for a range of nozzle areas from 50% to 100% of the maximum area. The test program determined the effect on performance of: (1) Moving the hub or shroud sidewall; (2) Sidewall-vane clearance leakage; (3) Vaneless space geometry change; and (4) Nozzle cooling flows. Data were obtained for a range of pressure ratios and speeds and are presented in a number of performance maps. Author

The effect of prerotation at the inlet of each stage was tested on a two stage axial compressor. The technical specifications are 45000 turns/min, 3.35 Kg of air/sec, and a compression rate of 12. A mechanical and aerodynamic study was performed in order to reduce the Mach number at the inlet of the rotating blades. The results confirm that the introduction of prerotation in the design improves overall compressor efficiency. ESA

A theoretical prediction method based on the decomposition of the actual combustion chamber in elementary reaction volumes which are described by a model is investigated. Aerodynamic characterization of the chamber, combustion chemistry models, and carburant distribution in the combustion chamber were studied. An algorithm was developed and experimentally verified. The proposed method leads to prediction models which describe CO pollution, efficiency, and combustion stability for a reasonably low computing cost. ESA

**THE MEASUREMENT OF AIRCRAFT PERFORMANCE AND STABILITY AND CONTROL AFTER FLIGHT THROUGH NATURAL ICING CONDITIONS**
R. J. RANAUDO, K. L. MIKKELSEN, R. C. MCKNIGHT, R. F. IDE, A. L. REEHORST (NASA, Lewis Research Center, Cleveland, OH) et al. AIAA, AHS, CASI, DGLR, IES, ISA, ITEA, SETP, and SFTE, Flight Testing Conference, 3rd, Las Vegas, NV, Apr. 2-4, 1986. 46 p. Previously announced in STAR as N86-22582. refs
(AIAA PAPER 86-9758)

The effects of airframe icing on the performance and stability and control of a twin-engine commuter-class aircraft were measured by the NASA Lewis Research Center. This work consisted of clear air tests with artificial ice shapes attached to the horizontal tail, and natural icing flight tests in measured icing clouds. The clear air tests employed static longitudinal flight test methods to determine degradation in stability margins for four simulated ice shapes. The natural icing flight tests employed a data acquisition system, which was provided under contract to NASA by Kohlman Systems Research Incorporated. This system used a performance modeling method and modified maximum likelihood estimation (MMLE) technique to determine aircraft performance degradation and stability and control. Flight test results with artificial ice shapes showed that longitudinal, stick-fixed, static margins are reduced on the order of 5 percent with flaps up. Natural icing tests with the KSR system corroborated these results and showed degradation in the elevator control derivatives on the order of 8 to 16 percent depending on wing flap configuration. Performance analyses showed the individual contributions of major airframe components to the overall degradation in lift and drag. Author

**THE DESIGN OF A SLIDING MODE CONTROLLER FOR DUTCH ROLL DAMPING IN A NON-LINEAR AIRCRAFT SYSTEM**
P. P. ASLIN, R. J. PATTON (York, University, Heslington, England), and C. M. DORLING (Sheffield, University, England) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 2 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 435-439. refs

The design and application of a sliding mode VSS (variable structure system) controller to the lateral motion subsystem of an RPV are considered. The controller was designed using new results concerning VSS analysis, providing a rigorous design technique combining eigenvalue and eigenvector assignment. In addition, the robustness properties of this control were investigated by using the nonlinear control law with a full-six-DOF aerodynamic model of the aircraft. The degree of insensitivity achieved by the sliding design is examined, and it is shown that the VSS controller provides acceptable performance. The demands placed on the actuators were shown to be small, and little evidence of 'chatter' was apparent. B.J.

**THE DESIGN OF MULTI-FUNCTIONAL FLIGHT CONTROLLERS FOR STRUCTURAL LOAD ALLEVIATION**
A. BRADSHAW (Salford, University, England) and S. E. BURGE (British Aerospace, PLC, Weybridge, England) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 2 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 440-445. refs

A summary of a general control system design technique for the class of second-order multivariable systems is presented. This technique is particularly suited to the design of high-performance multi-functional flight control-laws. Indeed, the presentation of real-time analogue computer-microprocessor simulation results demonstrates the performance achievable by the implementation of such control-laws, in that they most satisfactorily effect the required tasks of accurate pitch maneuvering while simultaneously alleviating wing loads induced by the maneuver and by discrete gusts even for naturally unstable aircraft. **ON THE RELATIONSHIP BETWEEN ROBUSTNESS TESTS AND THEIR APPLICATION TO HELICOPTER CONTROL SYSTEM DESIGNS**

M. S. TOMBS and I. POSTLETHWAITE (Oxford University, England) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 2 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 464-468. SERC-supported research. refs

Various methods of using singular value inequalities in the frequency domain to analyze the robustness of a control system design are compared, with particular emphasis on the class of possible plant models allowed by those constraints which must be satisfied before an inequality test is applicable. The relationship between Lehtomaki's robustness test and an inverse Nyquist based test is established, the former being a special case of the latter. The combined test as presented in Postlethwaite and Foo (1983) has been demonstrated to apply when a plant has uncertain poles close to the imaginary axis. The tests are compared with respect to their application to a control system design based on an LQG robustness recovery procedure. A helicopter design example is considered which illustrates the degree of usefulness of the different tests, and also allows an evaluation of the LQG design procedure. B.J.

**A DESIGN APPROACH TO A PERFORMANCE SEEKING CONTROL**

P. SHAW, J. FORGROVER (Northrop Corp., Aircraft Div., Hawthorne, CA), D. F. BERG, J. SWAN, S. ADIBHATLA (General Electric Co., Fairfield, CT) et al. AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 14 p. USAF-supported research. refs
(AIAA PAPER 86-1674)

An indirect adaptive control system is being developed that will optimize the performance of a combined aircraft-engine system by minimizing the fuel flow consumption for subsonic and supersonic cruise operation. The indirect approach first perturbs a model of the aircraft-engine system to establish the constrained gradient direction that will maximize the performance improvement rate. A gradient integration algorithm is then used to follow the non-linear gradient direction to optimum performance. The gradient search identifies incremental changes to the current control variable positions which are then transmitted to the control as revised demands. The aircraft and the engine control systems respond to the changes in their schedules by adjusting the control system actuators through normal control operation. The resultant control laws will be modeled and included in a high fidelity, six-degree-of-freedom aircraft-engine simulation incorporating advanced tactical fighter aircraft features. A comprehensive evaluation test plan, which includes an assessment of potentially long-term instability due to unmodeled dynamics, has been developed to evaluate this adaptive control system design. This paper discusses the design approach for an indirect adaptive trim control system which will optimize the performance of a combined aircraft and propulsion system. Author

**EIGENSTRUCTURE SYNTHESIS OF AN OBLIQUE WING FLIGHT CONTROL SYSTEM**

G. L. LARSON and K. W. WILLISTON (Rockwell International Corp., Los Angeles, CA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 660-662. Research supported by Rockwell International Corp.

A flight control system design employing the recently developed linear control techniques of eigenstructure synthesis and command generator tracking is presented for an oblique wing fighter. The eigenvalues governing modal frequency and damping are developed such that the vehicle dynamics are compliant with MIL-F-8785c, 'Flying Qualities of Piloted Aircraft'. Eigenvectors are deterministically developed through output feedback in an attempt to achieve orthogonality, decoupling the symmetric and asymmetric modes of motion. The design is unique in that longitudinal and lateral/directional SAS are developed simultaneously using the same linear model. A simplified constrained controller is examined weighing complexity against performance, after which feed-forward gains are developed to translate desired pilot control to multisurface commands. For example, the NASA Oblique Wing Research Aircraft (OWRA) in transonic flight with the wing highly swept is presented as a demanding situation. Author

**DESIGN ISSUES FOR FAULT TOLERANT-RESTRUCTURABLE AIRCRAFT CONTROL**

J. S. ETERNO, J. L. WEISS, D. P. LOOZE, and A. WILLSKY (ALPHATECH, Inc., Burlington, MA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 900-905. refs

Passive and active techniques for fault tolerance and aircraft control are discussed. The advantages of passive robust control and adaptive control for reconstructable flight control systems (RFCSs) are examined. The residual generation of signals, the decision process, and hypothesis test design for the failure detection and identification techniques are described. The uses of control mixer concept, gain scheduling, or artificial intelligence techniques for control system reconfiguration are analyzed. Flight control system (FCS) reconfiguration based on LQ design techniques is considered. An automatic redesign algorithm is utilized to modify the FCS to reconstruct the unfailed aircraft design while directly incorporating control bandwidth constraints; an example of the LQ based approach for fault tolerance and aircraft control is provided. The capabilities of a RFCS which incorporates a failure detection and isolation module, an automatic redesign module, and a robust multivariable flight control system are studied. I.F.

**EFFECT OF TIME DELAY ON FLYING QUALITIES: AN UPDATE**
R. E. SMITH and S. K. SARRAFIAN Aug. 1986 13 p Proposed for presentation at the AIAA Guidance, Navigation and Control Conference, Williamsburg, Va., 18-20 Aug. 1986
(NASA-TM-88264; H-1351; NAS 1.15:88264) Avail: NTIS HC A02/MF A01 CSCL 01C

Flying qualities problems of modern, full-authority electronic flight control systems are most often related to the introduction of additional time delay in aircraft response to a pilot input. These delays can have a significant effect on the flying qualities of the aircraft. Time delay effects are reexamined in light of recent flight test experience with aircraft incorporating new technology. Data from the X-29A forward-swept-wing demonstrator, a related preliminary in-flight experiment, and other flight observations are presented. These data suggest that the present MIL-F-8785C allowable-control system time delay specifications are inadequate or, at least, incomplete. Allowable time delay appears to be a function of the shape of the aircraft response following the initial delay. The cockpit feel system is discussed as a dynamic element in the flight control system. Data presented indicate that the time delay associated with a significant low-frequency feel system does not result in the predicted degradation in aircraft flying qualities. The impact of the feel system is discussed from two viewpoints: as a filter in the control system which can alter the initial response shape and, therefore, the allowable time delay, and as a unique dynamic element whose delay contribution can potentially be discounted by special pilot loop closures. **IMPLEMENTATION AND FLIGHT TESTS FOR THE DIGITAL INTEGRATED AUTOMATIC LANDING SYSTEM (DIALS). PART 2: COMPLETE SET OF FLIGHT DATA**
R. M. HUESCHEN Jul. 1986 330 p
(NASA-TM-87632-PT-2; NAS 1.15:87632-PT-2) Avail: NTIS HC A15/MF A01 CSCL 17G

Five flight tests of the Digital Automated Landing System (DIALS) were conducted on the Advanced Transport Operating System (ATOPS) Transportation Research Vehicle (TSRV)--a modified Boeing 737 Aircraft for advanced controls and displays research. These flight tests were conducted at NASA's Wallops Flight Center using the Microwave Landing System (MLS) installation on Runway 22. This report is primarily a collection of data plots of all performance variables recorded for the entire five flight tests. A description and source of the performance variables is included. Performance variables include inertial data, air data, automatic control commands, control servo positions, sensor data, DIALS guidance and control parameters, and Kalman filter data. This data illustrates low overshoot captures of the localizer for intercept angles of 20 deg, 30 deg, 40 deg, and 50 deg intercept angles, and low overshoot captures of the glideslope slope for 3 deg, 4.5 deg, and 5 deg glideslopes. Flare maneuvers were successfully performed from the various glideslope angles and good decrab maneuvers were performed in crosswinds of 6 knots. In 18 to 20 knot crosswind conditions rudder limiting occurred which caused lateral drifting although heading alignment was achieved. Author

Eigenstructure assignment methods are shown to be a useful tool for computing control laws of multivariable systems. In a first step closed loop eigenvalues are to be assigned. The second step uses the degrees of freedom available on the eigenvectors for optimizing criteria relative to control objectives as output shaping, insensitivity, or disturbance decoupling. The degrees of freedom of eigenvectors are defined and it is shown how to obtain control objectives. The design of an autopilot is detailed to demonstrate the method's efficiency. ESA

Five flight tests of the Digital Automated Landing System (DIALS) were conducted on the Advanced Transport Operating Systems (ATOPS) Transportation Research Vehicle (TSRV) -- a modified Boeing 737 aircraft for advanced controls and displays research. These flight tests were conducted at NASA's Wallops Flight Center using the microwave landing system (MLS) installation on runway 22. This report describes the flight software equations of the DIALS which was designed using modern control theory direct-digital design methods and employed a constant gain Kalman filter. Selected flight test performance data is presented for localizer (runway centerline) capture and track at various intercept angles, for glideslope capture and track of 3, 4.5, and 5 degree glideslopes, for the decrab maneuver, and for the flare maneuver. Data is also presented to illustrate the system performance in the presence of cross, gust, and shear winds. The mean and standard deviation of the peak position errors for localizer capture were, respectively, 24 feet and 26 feet. For mild wind conditions, glideslope and localizer tracking position errors did not exceed, respectively, 5 and 20 feet. For gusty wind conditions (8 to 10 knots), these errors were, respectively, 10 and 30 feet. Ten hands off automatic lands were performed. The standard deviation of the touchdown position and velocity errors from the mean values were, respectively, 244 feet and 0.7 feet/sec. Author

(Contract NAG2-371)
(NASA-CR-177164; NAS 1.26:177164; CRINC-FRL-714-1) Avail: NTIS HC A05/MF A01 CSCL 01C

Theoretical methods of predicting aircraft buffeting are reviewed. For the buffeting due to leading edge vortex breakdown, a method is developed to convert test data of mean square values of fluctuating normal force to buffeting vortex strength through an unsteady lifting-surface theory and unsteady suction analogy. The resulting buffeting vortex from the leading edge extension of an F-18 configuration is used to generate a fluctuating flow field which produces unsteady pressure distribution on the vertical tails. The root mean square values of root bending moment on the vertical tails are calculated for a rigid configuration. Author

The impact of independent canard and flaperon control of the longitudinal axis of a generic forward swept wing aircraft is examined. The Linear Quadratic Gaussian (LQG)/Loop Transfer Recovery (LTR) method is used to design three compensators: two single-input-single-output (SISO) systems, one with angle of attack as output and canard as control, the other with pitch attitude as output and canard as control, and a two-input-two-output system with both canard and flaperon controlling both the pitch attitude and angle of attack. The performances of the three systems are compared showing the addition of flaperon control allows the aircraft to perform in the precision control modes with very little loss of command following accuracy. A new, advanced system for active control of helicopters and its application to the solution of rotor aerodynamic and aeroelastic problems is described. Each blade is individually controlled in the rotating frame over a wide range of frequencies. Application of the system to gust alleviation, attitude stabilization, vibration alleviation, blade lag damping augmentation, stall flutter suppression, blade flapping stabilization, stall alleviation, and performance enhancement is outlined. The effectiveness of the system in achieving most of these applications is demonstrated by experimental results from wind tunnel tests of a model helicopter rotor with individual blade control. The feasibility of achieving many or all of the applications of individual blade control using the conventional helicopter swash plate is demonstrated, and the necessary control laws are presented. Two techniques, direct eigenspace assignment (DEA) and explicit model following (EMF), are used initially to synthesize control laws for the longitudinal dynamics model of a Short Takeoff and Landing (STOL) vehicle in the landing configuration. The vehicle model and the flight control design are presented. The two synthesis techniques are briefly discussed and the handling qualities specifications mapped into the algorithm formulations. The control laws resulting from exercising the algorithms are evaluated in terms of achieved performance and robustness. Since the synthesized control laws involve full state feedback, methodologies were implemented for the control laws using output feedback without adversely affecting performance and robustness. Finally, the salient features of the two design techniques are summarized and the areas that require further investigation are suggested. B.G.

**AN EXPERIMENTAL AND ANALYTICAL INVESTIGATION OF ISOLATED ROTOR FLAP-LAG STABILITY IN FORWARD FLIGHT**

G. H. GAONKER, M. J. MCNULTY (Army Research and Technology Labs., Moffett Field, Calif.), and J. NAGABHUSHAN (Indian Inst. of Science, Bangalore) Sep. 1985 31 p Presented at the 11th European Rotorcraft Forum, London, England, 10-13 Sep. 1985
(Contract NCC2-361)
(NASA-CR-177028; NAS 1.26:177028; PAPER-66) Avail: NTIS HC A03/MF A01 CSCL 01C

For flap-lag stability of isolated rotors, experimental and analytical investigations are conducted in hover and forward flight on the adequacy of a linear quasisteady aerodynamics theory with dynamic inflow. Forward flight effects on lag regressing mode are emphasized. A soft inplane hingeless rotor with three blades is tested at advance ratios as high as 0.55 and at shaft angles as high as 20 degrees. In combination with lag natural frequencies, collective pitch settings and flap-lag coupling parameters, the data base comprises nearly 1200 test points (damping and frequency) in forward flight and 200 test points in hover. By computerized symbolic manipulations, an analytic model is developed in substall to predict stability margins with mode identification. It also predicts substall and stall regions to help explain the correlation between theory and data. Author

(Contract NCC4-1)
(NASA-CR-176994; NAS 1.26:176994) Avail: NTIS HC A06/MF A01 CSCL 01C

A method for predicting the vibrational stability of an aircraft with an analog active aileron flutter suppression system (FSS) is expained. Active aileron refers to the use of an active control system connected to the aileron to damp vibrations. Wing vibrations are sensed by accelerometers and the information is used to deflect the aileron. Aerodynamic force caused by the aileron deflection oppose wing vibrations and effectively add additional damping to the system. Author

Optical applications to the flight control system including optical data bus, sensors, and transducers are analyzed. Examples of optical data bus include airborne light optical fiber technology (ALOFT), F-5E, YA-7D, MIL-STD-1553 fiber optic data bus and NAL-optic data bus. This NAL-optic data bus is applied to STOL, and its characteristics are stressed. Principles and advantages of optical pulse-digital transducers are discussed. Author

**STOLPORT LONDON - A DESIGN FOR SAFETY**
I. BROOM (Gatwick Handling, Ltd., Horley; Plessey Airports, Ltd., Weybridge, England) International Journal of Aviation Safety (ISSN 0264-6803), vol. 3, Sept. 1985, p. 166-170.

An evaluation is made of the range of design planning and operations integration considerations that have shaped the STOLport currently under construction in the center of London. The STOLport is intended exclusively for commuter airliners that are able to at least match the noise output and IFR runway requirements of the four-engine DHC-7 aircraft. Attention is given to runway design, residential considerations, noise minimization requirements, and navigational resources of the London area. O.C.

**FLIGHT SIMULATOR UPGRADES AND MODIFICATIONS**
P. V. PRABHU and N. K. AGARWAL (GMI, Broken Arrow, OK) IN: Simulators; Proceedings of the Conference, Norfolk, VA, March 3-8, 1985 . La Jolla, CA, Society for Computer Simulation, 1985, p. 1-5.

In connection with the arising need for additional capability to train pilots in a flight simulator, a cost-effective alternative to the procurement of a new simulator can be the upgrading modification of an existing simulator. Benefits of such an alternative are related to lower procurement cost and shorter delivery time. Areas of update are discussed, taking into account aircraft modifications, new government standards, new aircraft data, new training requirements, and aspects of maintainability. Questions of industry performance are investigated, and areas of concern are examined. In addition to the solution of other problems, an exact definition of the improvements to be achieved by the upgrade of the simulator needs to be established. G.R.

**SOFTWARE POSITION AND VELOCITY LIMITING FOR A SYNERGISTIC SIX DEGREE-OF-FREEDOM MOTION SYSTEM**
D. R. CAMPBELL (Paisley College of Technology, Scotland) Aeronautical Journal (ISSN 0001-9240), vol. 90, April 1986, p. 121-127. refs

The cross-coupling effect of the hardware and software limiting of motion platform hydraulic jacks' velocity and displacement, which leads to spurious cue generation in the range below 2 Hz, has in the past been ignored. It is presently noted that the setting of software limits and the scaling of jack demands with respect to both this limit and the maximum jack demand yields a limiting strategy that maintains acceleration cue directional fidelity; such a simple scheme encompasses a soft limiting approach for motion jerk reduction, and requires negligible extra computing time or storage. **A COMPUTATIONAL FLUID DYNAMICS EVALUATION OF TEST CELL RECIRCULATION EFFECTS ON HIGH-BYPASS TURBOFAN ENGINE SURFACE PRESSURE DISTRIBUTIONS**
D. H. HUDDLESTON, G. K. COOPER, and W. J. PHARES (Sverdrup Technology, Inc., Arnold Air Force Station, TN) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 6 p. refs
(AIAA PAPER 86-1384)

A computational fluid dynamics analysis of an engine exhaust/test cell/diffuser combination is presented. The full Reynolds-averaged Navier-Stokes equations are solved by application of a Beam-Warming algorithm on a numerically generated, body-fitted computational grid. Axisymmetric numerical results and correlations with experiment are presented for a high-bypass turbofan engine and for a subscale turbofan model. The correlations with experiment indicate that the current solution technique provides both a qualitative (overall flow field) and quantitative (surface pressure distribution) analysis capability for engine exhaust/test cell/diffuser flows including test cell recirculation. The results presented indicate a potential for applying this technology to the assessment and correction of test cell effects in high-bypass turbofan engine testing. Author

**A TURBINE ENGINE INLET VIEWING SYSTEM**

R. A. BELZ, C. W. BRASIER, P. J. MURPHY, and T. D. DAVIS (Sverdrup Technology, Inc., Arnold Air Force Station, TN) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p.
(AIAA PAPER 86-1647)

A video imaging system has been developed for turbine engine testing at the Arnold Engineering Development Center to allow observation of individual fan blades, stator blades, and the spinner surface area while the engine is running. The system utilizes off-the-shelf hardware including a strobed laser light source, a fiber-optical cable, and a high-sensitivity video camera to view the inlet in stop motion. Laser strobing is synchronized to the engine rotation for fan and spinner analysis. The system was used to observe ice buildup and shedding on the fan blades and spinner during an engine icing test. Blade-case rubbing was also observed during the test. The strobed laser system is described, ice formations observed on the spinner and fan blades are presented, and applications and planned future improvements to the system are described. Author

**THEORETICAL AND EXPERIMENTAL INVESTIGATION OF TEST CELL AERODYNAMICS FOR TURBOFAN APPLICATIONS**

A. I. KARAMANLIS, J. S. SOKHEY, T. C. DUNN, and D. C. BELLOMY (General Electric Co., Cincinnati, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 12 p. Research supported by the General Electric Co. refs
(AIAA PAPER 86-1732)

This paper describes aerodynamic design, model testing and full scale checkout of a General Electric aircooled exhaust turbofan test facility. The purpose of the research and development work reported herein is to modify the existing test cell configuration to accept high and low bypass ratio turbofan engines with or without afterburner. A brief description of the scale model tests including engine simulation, model test facility and data reduction is given. The comparison of test cell characteristics, i.e., Front Cell Velocity Distortion, Front Cell Depression, Air Flow Rate, Exhaust System Flow Mixing and Temperatures between the model scale and full scale tests is presented. The theoretical results from engine/exhaust collector inviscid and viscous flow analyses, which were used to obtain preliminary exhaust system performance data are also presented. Correlations between full scale and model scale data reveal that the performance of a full scale test cell can be predicted using model scale tests thereby reducing test cell development costs. (Contract NASW-4005)
(NASA-TM-88446; NAS 1.15:88446; OA-9/5007-AYD; DERAT-9/5007-DY) Avail: NTIS HC A03/MF A01 CSCL 14B

The design of a cryogenic wind tunnel which operates continuously, and is capable of attaining transonic speeds at generating pressures of about 3 bars is described. Its stainless steel construction with inside insulation allows for very rapid temperature variations promoted by rapid changes in the liquid nitrogen flow. A comparative study of temperature measuring probes shows a good reliability of thin sheet thermocouples. To measure fluctuations, only a cold wire makes it possible to record frequencies of about 300 Hz. The use of an integral computer method makes it possible to determine the impact of the wall temperature ratio to the adiabatic wall temperature for the various parameters characterizing the boundary layer. These cases are processed with positive and negative pressure gradients. Author

**INTERFACE OF THE TRANSPORT SYSTEMS RESEARCH VEHICLE MONOCHROME DISPLAY SYSTEM TO THE DIGITAL AUTONOMOUS TERMINAL ACCESS COMMUNICATION DATA BUS**

W. C. EASLEY and J. S. TANGUY (PRC Kentron, Inc., Hampton, Va.) May 1986 34 p refs
(NASA-TM-87728; NAS 1.15:87728) Avail: NTIS HC A03/MF A01 CSCL 14B

An upgrade of the transport systems research vehicle (TSRV) experimental flight system retained the original monochrome display system. The original host computer was replaced with a Norden 11/70, a new digital autonomous terminal access communication (DATAC) data bus was installed for data transfer between display system and host, while a new data interface method was required.

The new display data interface uses four split phase bipolar (SPBP) serial busses. The DATAC bus uses a shared interface ram (SIR) for intermediate storage of its data transfer. A display interface unit (DIU) was designed and configured to read from and write to the SIR to properly convert the data from parallel to SPBP serial and vice versa. It is found that separation of data for use by each SPBP bus and synchronization of data tranfer throughout the entire experimental flight system are major problems which require solution in DIU design. The techniques used to accomplish these new data interface requirements are described. Author

**A NUMERICAL STUDY OF THE AERODYNAMIC INTERFERENCE OF A MODEL SUPPORT SYSTEM USED IN THE RAE 5 METRE WIND TUNNEL**

B. C. HARDY 5 Sep. 1985 30 p
(AD-A165671; RAE-TM-AERO-2046; BR97527; ESA-86-97105)
Avail: NTIS HC A03/MF A01

Lift interference effects of under-wing strut guards were studied using panel methods. Unexpected reduction in interference with increase in lift beyond a certain value is accounted for by a sweep dependent, nonlinear lift contribution. The level of agreement between theory and experiment shows that the mutual lift and the displacement effects need to be considered. Further comparisons between the calculation method and experiment are necessary to establish how much of the remaining discrepancy in calculations is due to the shortcomings of the method and how much to uncertainties in the experimental data. This report is Volume 2 of a two volume set dealing with the application of non-woven fabrics to rigid airport pavements to control and/or retard the development of reflection cracking of flexible overlays due to both thermal stresses and load-associated fatigue. This volume describes the development of a new viscoelastic analysis model for the analysis of thermal cracking that utilizes fundamental material properties and does not rely on phenomenological distress functions. The methods developed in this work as well as those presented in Phase 1 (Volume 1), have been validated on one airport and four highway projects. The validation is described in this report and shows that the developed analysis models predict the reflection cracking phenomenon for all projects very well. This report also describes the laboratory evaluation of a fiber-asphalt SAMI layer that shows promise for use in reflection cracking control. Finally, specifications for material properties, testing procedures, and construction methods are presented. Author

(Contract NASW-4006)
(NASA-TM-88442; NAS 1.15:88442; OA-34/3075; DERAT-12/5015-DN) Avail: NTIS HC A08/MF A01 CSCL 14B

The results obtained on the AS 07 wing and the working section walls for three types of configurations are reported. The first, called non-adapted, corresponds to the divergent upper and lower rectilinear walls which compensate for limit layer thickening. It can serve as a basis for complete flow calculations. The second configuration corresponds to wall shapes determined from calculations which tend to minimize interference at the level of the fuselage. Finally, the third configuration, called two-dimensional adaptation, uses the standard method for T2 profile tests. This case was tested to determine the influence of wall shape and error magnitude. These results are not sufficient to validate the three-dimensional adaptation; they must be coordinated with calculations or with unlimited atmosphere tests. Author

**THE EFFECT OF A SPLITTER PLATE AS BOUNDARY LAYER REMOVAL SYSTEM IN HALF-MODEL TESTING**

H. BIPPES Sep. 1985 29 p
(DFVLR-FB-85-64; ISSN-0171-1342; ESA-86-97454) Avail: NTIS HC A03/MF A01; DFVLR, Cologne, West Germany, DM 10.50

The effect of a splitter plate as boundary layer removal system in half-model testing is investigated. The experiments are performed on a rectangular wing in the range of maximum lift in subsonic flow. Oil flow patterns display the footprints of a complicated three-dimensional secondary flow in the neighborhood of the model to wall junction. This secondary flow leads to a considerable increase of local lift. The data analysis reveals that its intensity depends on the vorticity of the free shear layer separating from the suction side of the wing and the spanwise variation of the circulation, but only slightly on the thickness of the boundary layer on the splitter plate. Comparison with tests without splitter plate shows that under the test conditions investigated the use of the splitter plate is not an effective means for improving the mirror conditions in half-model testing. **AN ORBITAL MANEUVERING VEHICLE SIMULATOR**
W. TEOH, J. WALLS (Alabama, University, Huntsville), T. BRYAN, F. ROE (NASA, Marshall Space Flight Center, Huntsville, AL), and N. SHIELDS (Essex Corp., Huntsville, AL) IN: Space tech; Proceedings of the Conference and Exposition, Anaheim, CA, September 23-25, 1985 . Dearborn, MI, Society of Manufacturing Engineers, 1985, p. 6-14 to 6-23.

The Orbital Maneuvering Vehicle (OMV) is a teleoperated vehicle designed to dock with a target vehicle in space to peform certain tasks. This vehicle is not yet in production, but a simulator of the OMV is located at Marshall Space Flight Center (MSFC). The MSFC facility provides a realistic simulation of the OMV. Various docking maneuvers can be studied in some detail. A special robot has been constructed that provides a moving target for the simulator to dock with. This facility is valuable for conducting studies on the OMV; it also is excellent for personnel training. Author

**SYSTEM AND TECHNOLOGY CONSIDERATIONS FOR SPACE-BASED AIR TRAFFIC SURVEILLANCE**
A. VAISNYS (California Institute of Technology, Jet Propulsion Laboratory, Pasadena) IN: Space Systems Technology Conference, San Diego, CA, June 9-12, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 31-36. FAA-sponsored research.
(AIAA PAPER 86-1170)

This paper describes the system trade-offs examined in a recent study of space-based air traffic surveillance. Three system options, each satisfying a set of different constraints, were considered. The main difference in the technology needed to implement the three systems was determined to be the size of the spacecraft antenna aperture. It was found that essentially equivalent position location accuracy could be achieved with apertures from 50 meters down to less than a meter in diameter, depending on the choice of signal structure and on the desired user update rate. **DEVELOPMENT OF A REUSABLE, FLIGHT-WEIGHT CRYOGENIC FOAM INSULATION SYSTEM**
P. S. MCAULIFFE (Lockheed-California Co., Burbank), R. C. DAVIS, and A. H. TAYLOR (NASA, Langley Research Center, Hampton, VA) AIAA, Space Systems Technology Conference, San Diego, CA, June 9-12, 1986. 11 p. refs
(AIAA PAPER 86-1189)

Attention is given to a light weight foam insulation system applicable to reusable cryogenic propellant tankage for hypersonic aircraft and space launch vehicles. The insulation system consists of nominally sized blocks of a high temperature-resistant polymethacrylimide foam that is wrapped with a vapor-impermeable membrane of Kapton-aluminum-Kapton laminate, which is adhesively bonded to the outer propellant tank wall. Test results are presented which indicate that this insulation system is capable of enduring a Mach 5 service environment without structural cracking, deterioration, or loss of performance. O.C.

**FAILURE DETECTION AND ACCOMMODATION IN STRUCTURAL DYNAMICS SYSTEMS USING ANALYTIC REDUNDANCY**
J. P. WILLIAMS and R. C. MONTGOMERY (NASA, Langley Research Center, Hampton, VA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 906-910. refs

The concept of analytic redundancy is extended to identify nonzero constant output failures in large spacecraft active control sensors and actuators, using a set of distributed sensors which do not nominally produce equivalent signals but are related through the structural dynamics of the system. The suboptimal technique uses a Sequential Probability Ratio Test on the residual sequence of a Kalman filter based on a modal structure model, to determine failure of a component based on an assumed failure hypothesis. The specific failure is identified and then the Kalman filter gains are reconfigured for the identified remaining working sensor set. Experimental data using an apparatus whose dynamics are representative of a large spacecraft show the nominal filter performance under failed and unfailed conditions. R.R.

Avail: CPIA, Laurel, Md. 20707 HC $70.00 CSCL 21B

Coaxial, dump type ramjet combustors are often prone to combustion instability problems that can seriously affect their performance. Low frequency instabilities which represent one of the most common types of instabilities encountered are discussed. In particular, the coupling between cone-like flames often encountered in dump type combustors and longitudinal acoustic fields is studied. A variety of experimental techniques, including high speed Schlieren and shadow photography, CH radiation emission and acoustic pressure measurements are used. A strong coupling between the flame response and certain acoustic natural frequencies of the experimental set up is observed. These observations shed new light on flame/acoustic mode interactions in a ramjet combustor-like environment and the limitations of current state of the art theoretical models of this phenomenon. Pressure oscillations in ramjet engines have been studied using an approximate method which treats the flow fields in the inlet and the combustor separately. The acoustic fields in the combustor are expressed as syntheses of coupled nonlinear oscillators corresponding to the acoustic modes of the chamber. The influences of the inlet flow appear in the admittance function at the inlet/combustor interface, providing the necessary boundary condition for calculation of the combustor flow. A general framework dealing with nonlinear multi-degree-of-freedom system has also been constructed to study the time evolution of each mode. Both linear and nonlinear stabilities are treated. The results obtained serve as a basis for investigating the existence and stabilities of limit cycles for acoustic modes. As a specific example, the analysis is applied to a problem of nonlinear transverse oscillations in ramjet engines. Author

Avail: CPIA, Laurel, Md. 20707 HC $70.00 CSCL 21B

Cold flow simulations are performed for the flow inside a ramjet combustor with dump. The objective is to develop a numerical simulation code that can be used to study the complex interaction between acoustic waves and large vortex structures in such a device. The compressible Navier-Stokes equations are solved using a MacCormack semi-implicit scheme. Beginning with a flow at rest, the flow seems to reach a state of stationary variation ten longitudinal acoustic cycles after the exit pressure is lowered to a prescribed value. Vorticity contour plots reveal that the shear layer behind the backward-facing step rolls up into large vortices. These vortices go through two pairings before being convected into the wall layer. The frequency of the vortex after the second pairing is near the range of the jet preferred mode. The unsteady component of the dilation field is chosen as a quantity that characterizes the acoustic component of the motion. Contour plots of the dilation field show that it is dominated by the quadrupole sources associated with rolled up vortices. The long-wavelength standing waves cannot be detected using this method. Examination of the two-point, two-time correlation of the pressure variations at several points in the flow field gives evidence that the long-wavelength acoustic waves close to the jet preferred mode frequency have been excited. K. KAILASANATH, J. GARDNER, J. BORIS, and E. ORAN *In* Johns Hopkins Univ. The 22nd JANNAF Combustion Meeting, Vol. 1 p 341-350 Oct. 1985
Avail: CPIA, Laurel, Md. 20707 HC $70.00 CSCL 21B

Results are presented of numerical simulations performed to isolate and study the interaction between acoustic waves and large scale coherent vortex structures in an idealized ramjet combustor. A strong coupling between the acoustic modes of the chamber and large scale vortical structures is observed. The results in the early part of the calculations are indicative of an unforced natural vortex growth at a frequency close to the acoustic frequency. With time, the acoustic modes shift the frequency of the most amplified mode into resonance with the acoustic mode. The location in space where the modes grow can also be shifted by acoustic forcing. An interesting new feature that is observed is a low frequency mode corresponding to the passage of the vortex structures through the choked exit. This results in a major alteration of the merging pattern of the vortices. Author

**PRODUCTION OF ALUMINIUM-LITHIUM ALLOY WITH HIGH SPECIFIC PROPERTIES**
P. MEYER and B. DUBOST (Cegedur Pechiney, Centre de Recherches et Developpement, Voreppe, France) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 37-46. refs

Reducing the weight of aircraft structure through the use of lighter advanced materials has become a major goal. Pechiney's extensive research and development program has resulted in a new family of aluminum-lithium alloys. Thanks to the combination of efficient D.C. casting, alloy design coprecipitation strengthening and structural control, these CP 27X alloys overcome the previously identified brittleness of Al-Li alloys and already match most current goals for a wide use on aircraft. Author

### 'ALITHALITE' ALLOYS - PROGRESS, PRODUCTS AND PROPERTIES

P. E. BRETZ and R. R. SAWTELL (Alcoa Laboratories, Alcoa Center, PA) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 47-56. refs

Alithalite Al-Li alloys are being developed by Alcoa to meet four first-generation objectives: low-density replacements for 2024-T3X, 7075-T6X, and 7075-T73X products and a moderate-strength, minimum density alloy. One alloy, recently registered as 2090 (Al-2.7 wt pct Cu-2.2 pct Li-0.12 pct Zr), has been introduced as a replacement for 7075-T6X plate, sheet, and extrusion product forms. This paper concentrates on discussing the metallurgical and engineering property characteristics of this alloy. Progress toward developing alloys to meet the other objectives also will be outlined, with emphasis given to property achievements. Author

### ADHESIVE BONDING OF ALUMINIUM-LITHIUM ALLOYS

D. J. ARROWSMITH, R. J. DAVIES (Aston, University, Birmingham, England), A. W. CLIFFORD, and D. A. MOTH (Admiralty Research Establishment, Portland, England) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 148-151. refs

Al-2.35 pct Li-1.13 pct Cu alloy was adhesively bonded using established chromic acid anodizing and phosphoric acid anodizing processes. A new process consisting of sulfuric acid anodizing followed by a phosphoric acid dip was also used. The initial bond strengths and durabilities of lap shear joints of aluminum-lithium and aluminum-magnesium alloys were found to be similar. The anodizing characteristics of aluminum-lithium and aluminum-magnesium alloys were also found to be similar. Author

### COMPARISON OF CORROSION BEHAVIOUR OF LITHIUM-CONTAINING ALUMINIUM ALLOYS AND CONVENTIONAL AEROSPACE ALLOYS

P. L. LANE, J. A. GRAY, and C. J. E. SMITH (Royal Aircraft Establishment, Materials and Structures Dept., Farnborough, England) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986. p. 273-281. refs

Marine exposure and accelerated laboratory corrosion tests have been used to compare the corrosion behavior of some Al-Li-Mg-Cu alloys with conventional aerospace alloys. The pitting resistance of Al-Li-Mg-Cu alloys in neutral salt fog and under total immersion conditions is superior to that of conventional alloys. In a marine environment, Al-Li-Mg-Cu alloys exhibit exfoliation corrosion; the sheet material is particularly susceptible and resistance to exfoliation is improved by overaging. Stress corrosion cracking properties are similar to conventional alloys. Al-Li-Mg-Cu alloys are galvanically compatible with other aluminum alloys. Author

### TEXTURES DEVELOPED IN AL-LI-CU-MG ALLOY

M. J. BULL and D. J. LLOYD (Alcan International, Ltd., Kingston, Canada) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 402-410. refs

The crystallographic texture development of alloy 8090 as a function of rolling (hot and cold), cross-rolling (hot and cold) and after various thermal treatments is discussed. Where applicable, comparison will be made with other high strength aluminium alloys subjected to similar thermo-mechanical treatments. Author

### COARSENING OF DELTA PRIME, T1, S PRIME PHASES AND MECHANICAL PROPERTIES OF TWO AL-LI-CU-MG ALLOYS

M. AHMAD and T. ERICSSON (Linkoping Institute of Technology, Sweden) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London. Institute of Metals, 1986, p. 509-515. Research supported by the Styrelsen for Teknisk Utveckling and Saab-Scania, AB. refs

The aging response of the alloy has been determined by hardness measurements. The microstructures developed after various artificial aging treatments were studied by TEM. The effect of prestretch on the precipitation of S prime and T1 was investigated. The density of S prime and T1 was increased due to the prestretch. A significant improvement in the yield strength was obtained by stretching prior to aging. The ultimate tensile strength was also slightly improved, while the elongation to fracture was slightly reduced. In the under-aged condition deformation was localized within slip bands. The deformation was homogeneous for peak aged conditions. The fracture surfaces of failed tensile specimens were studied with the help of scanning electron microscopy (SEM). The mechanical properties and fracture behavior of the alloy has been correlated with microstructural features. Author

### DEVELOPMENT OF PROPERTIES WITHIN HIGH-STRENGTH ALUMINIUM-LITHIUM ALLOYS

P. J. GREGSON (Southampton, University, England), C. J. PEEL, and B. EVANS (Royal Aircraft Establishment, Materials and Structures Dept., Farnborough, England) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 516-523. refs

Further additions of magnesium and/or copper to Lital 'A' are shown to lead to high strengths satisfying DTD XXXB requirements; the extent of these additions is limited by the homogenization process. Optimum properties in the unstretched sheet are associated with the coprecipitation of delta prime and S phase. Author

### AGE HARDENING BEHAVIOR OF DTD XXXA

K. WELPMANN, M. PETERS (DFVLR, Institut fuer Werkstoff-Forschung, Cologne, West Germany), and T. H. SANDERS, JR. (Purdue University, West Lafayette, IN) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 London, Institute of Metals, 1986, p. 524-529. refs

Results of a study of the artificial and natural aging behavior of DTD XXXA, an Al-Li alloy considered for applications in the next generation military and transport aircraft, are reported. During natural aging, a strength increase is observed after an incubation period of about 30 hr, which is attributed to the formation and growth of Guinier-Preston zones. The artificial age hardening curves in the range 150-185 C have a plateau before reaching a peak; the plateau coincides with a minimum in elongation. The yield stress increases beyond the plateau and the corresponding increase of the elongation are attributed to an accelerated growth of S-prime particles. Stretching before artificial aging leads to a higher strength, which is thought to be a result of a more homogeneous distribution of the S-prime phase. V.L.

### EFFECT OF PRECIPITATION ON MECHANICAL PROPERTIES OF AL-LI-CU-MG-ZR ALLOY

J. WHITE, W. S. MILLER, I. G. PALMER (Alcan International, Ltd., Banbury, England), R. DAVIS, and T. S. SAINI (Alcan International, Ltd., Gerrards Cross, England) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 530-538. refs

Low ductility and poor fracture toughness in binary Al-Li alloys have been attributed to intense coplanar slip associated with the precipitation of the coherent delta prime phase. The introduction of additional precipitation may disperse planar slip and hence result in an improvement in the relationship between strength, ductility, and fracture toughness in more complex alloys. One such alloy system currently under development is Al-Li-Cu-Mg-Zr where S prime and T1 phases have been observed to nucleate heterogeneously on dislocations and subgrain boundaries. The present work examines the effect of cold work prior to aging at 190 C on the mechanical properties of commercially produced Al-Li-Cu-Mg-Zr sheet. Author

### DEFORMATION AND FRACTURE IN AL-LI BASE ALLOYS

W. S. MILLER, M. P. THOMAS (Alcan International, Ltd., Banbury, England), D. J. LLOYD, and D. CREBER (Alcan International, Ltd., Kingston, Canada) IN: Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford, England, July 8-11, 1985 . London, Institute of Metals, 1986, p. 584-594. refs

The deformation structures observed in Al-Li and Al-Li-Cu-Mg-Zr alloys are investigated with a view to determining the causes of the low ductility and fracture toughness of Al-Li-based alloys. An analysis of results, obtained by in-situ fracture surface analysis techniques, indicates that the low ductility and toughness of Al-Li alloys is largely due to grain-boundary segregation. Ways of reducing the effect of grain-boundary segregation on fracture behavior are discussed. V.L.

### EFFECT OF MOISTURE ON THERMAL PROPERTIES OF COMPOSITE MATERIALS FOR AEROSPACE APPLICATIONS

M. MARCHETTI, G. MAURA (Roma I, Universita, Rome, Italy), M. PAURI (Ancona, Universita, Italy), and F. VENIALI (Roma II, Universita, Rome, Italy) IN: Developments in the science and technology of composite materials; Proceedings of the First European Conference on Composite Materials and Exhibition, Bordeaux, France, September 24-27, 1985 . Bordeaux, France, Association Europeenne des Materiaux Composites, 1985, p. 201-206. Research sponsored by the Ministero della Pubblica Istruzione. refs

The effects of the fiber characteristics, water absorption and thermal spikes on the porosity and variations in the glass transition temperature (Tg) of composite materials were examined experimentally. Samples of fiber glass reinforced materials, carbon fiber reinforced plastic and Kevlar fiber reinforced laminates were exposed on two sides to water vapor. The samples were withdrawn at specified intervals and weighed. Equivalent specimens were subjected to thermal spikes ranging from 20-120 deg lasting for 5 min for seven times each. Other samples were degassed and sealed in containers before being exposed to the thermal spikes. Porosity did not change with the thermal spikes, which are typical of conditions experienced by materials on spacecraft and high performance aircraft. The apparent Tg values of epoxy matrices fell with water vapor absorption. Exposure to thermal spikes inhibited recovery from water vapor absorption, while recovery did occur in samples which absorbed moisture at room temperature. M.S.K.

### CARBON-CARBON COMPOSITES FOR BRAKING [LES CARBONE-CARBONE POUR LE FREINAGE]

L. HERAUD and B. BROQUERE (SocieteEuropeenne de Propulsion, Saint-Medard-en-Jalles, France) IN: Developments in the science and technology of composite materials; Proceedings of the First European Conference on Composite Materials and Exhibition, Bordeaux, France, September 24-27, 1985 . Bordeaux, France, Association Europeenne des Materiaux Composites, 1985, p. 440-446. In French. refs

The first use of Carbon-carbon composites (CCC) brake components in aircraft was on the Concorde, realizing a weight savings of 600 kg. CCC brakes are now used on the Mirage 2000 and on the Airbus 300 series aircraft. Brakes are intended to absorb and dissipate, by thermal emission, the kinetic energy of a moving vehicle. The thermal mass and specific mass of CCC are higher and lower than those of steel and coopper, respectively. Furthermore, thermomechanical properties of CCC do not degrade at high temperatures. CCC has a coefficient of friction of 0.3-0.6, similar to other braking materials, and remains stable under prolonged braking. Recent experience and expanded production of CCC materials have been sufficient to make the cost of CCC brakes competitive with other materials. The success of CCC brakes in aircraft and formula 1 racing cars is expected to lead to a widespread adoption of CCC brakes in cars. M.S.K.

### CARBON FIBRES AND THEIR COMPOSITES

E. FITZER, ED. (Karlsruhe, Universitaet, West Germany) Berlin and New York, Springer-Verlag, 1985, 307 p. For individual items see A86-40488 to A86-40499.

The present conference considers topics encompassing the fields of advanced composite reinforcing fibers, polymeric matrices, fabrication and design methodologies for carbon fiber-reinforced composites (CFRPs), the testing and fracture behavior of CFRPs, CFRP applications in aerospace, and the R&D activities in carbon fiber production of Brazil, India, China, and South Korea. Specific discussions are presented concerning the effect of matrix resin choice on prepreg processing, the development of thermosetting polyimide matrix resins, autoclave compression molding, design preparations for large space structures, CFRP testing and properties optimization, industrial and marine applications of carbon fiber reinforcements, and biomedical applications of CFRP. O.C.

A86-40488

### TECHNICAL STATUS AND FUTURE PROSPECTS OF CARBON FIBRES AND THEIR APPLICATION IN COMPOSITES WITH POLYMER MATRIX (CFRPS)

E. FITZER (Karlsruhe, Universitaet, West Germany) IN: Carbon fibres and their composites . Berlin and New York, Springer-Verlag, 1985, p. 3-45. refs

The structure of carbon fibres and its dependence on the presursor material gives an understanding of the properties of today's commercial fibre types. The possibilities of further improvement are considered from theoretical viewpoint as well as starting from the properties of PAN based fibres of the new generation must in development. The problem of correct terminology of this promising new material is raised. Economic considerations are presented, comprising a review on present technology, the world demand and the price situation. Finally, the various fields for application of carbon fibres - such as aerospace, transportation, sport, machinery and apparatus, cryogenic technology, as well as medicine - are discussed briefly. ### EXPERIENCES IN FRG IN AEROSPACE APPLICATION

K. BRUNSCH (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) IN: Carbon fibres and their composites . Berlin and New York, Springer-Verlag, 1985, p. 206-228.

Attention is given to the experience gained in West Germany to date with CFRPs' fiber, matrix resin, and fiber-resin interface characteristics. Attention is given to space structures applications such as the Intelsat V series satellites' solar cell array structure, as well as the Tornado fighter aircraft's taileron, a technology development CFRP fighter cockpit, and helicopter rotor blades and driveshafts. Also noted are recent advancements in CFRP fabrication and quality assurance techniques. O.C.

### A SIMPLIFIED RESIDUAL STRESS MODEL FOR PREDICTING FATIGUE CRACK GROWTH BEHAVIOR AT COLDWORKED FASTENER HOLES

X. SU, M. GU, and M. YAN (Institute of Aeronautical Materials, Beijing, People's Republic of China) Fatigue and Fracture of Engineering Materials and Structures (ISSN 8756-758X), vol. 9, no. 1, 1986, p. 57-64. refs

This paper presents an investigation of the fatigue crack growth (FCG) behavior at fastener holes in a high strength steel, 30CrMnSiNi2A, before and after a cold-expansion process. The fatigue life of coldworked specimens was significantly increased compared to noncoldworked ones and increased the lower applied stress level. From a study of the residual stress distribution near the edge of the hole, it was found that the experimental residual compressive stresses in absolute values were much less than the calculated values derived by previous analytical methods. Thus, a simplified residual stress model for describing the FCG behavior at coldworked fastener holes is proposed, from which, the Delta-K(eff) and fatigue lives of specimens after cold-expansion can be predicted satisfactorily for engineering applications. Author

### STRUCTURAL MATERIALS IN AERONAUTICS. II - PROSPECTS AND PERSPECTIVES

G. G. POPE (Royal Aircraft Establishment, Farnborough, England) Aerospace (UK) (ISSN 0305-0831), vol. 13, May-June 1986, p. 22-30. refs

Materials designed for airframe and gas turbine applications are presented, and it is noted that for the former category, the UK has the following alloys in mind: (1) a medium strength alloy DTDXXXA, intended to replace the medium strength general purpose alloy 2014-T651; (2) a high strength alloy DTDXXXB to replace higher strength 7000 series alloys; and (3) a fatigue resistant alloy DTDXXXC to replace 2024-T351. In the area of gas turbine applications, nickel-based alloys reinforced with tungsten wires have been made as well as ceramic materials such as those derived from the Si-Al-O-N system, and a composite made of carbon fibers in a carbon matrix. It is concluded that both the properties and the cost of an aircraft component are determined as much by the manufacturing route as by the intrinsic properties and cost of the material. Moreover, these areas require continued attention if the major potential benefits (i.e., cost effectiveness) of current advances in materials technology are to be realized to the full. K.K.

**A86-41051**

### COMPOSITE MATERIALS: TESTING AND DESIGN; PROCEEDINGS OF THE SEVENTH CONFERENCE, PHILADELPHIA, PA, APRIL 2-4, 1984

J. M. WHITNEY, ED. (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) Conference sponsored by ASTM. Philadelphia, PA, American Society for Testing and Materials, 1986, 466 p. For individual items see A86-41052 to A86-41073.

The present conference on the current development state of composite materials ranges over structures, failure mechanisms, delamination characteristics, strength properties, and analysis and characterization methods. Attention is given to the effects of manufacturing defects and service-induced damage on strength, testing and analysis methods for graphite/epoxy filament-wound composites' fracture toughness, the effect of stress biaxiality on transverse tensile strain-to-failure, the effect of laminate stacking sequence on notch sensitivity, and the effect of impact and fatigue loads on the strength of graphite/epoxy composites. Also considered are delamination-resistant composite concepts, the stimulation of delamination by interlaminar shear, and the tensile strength and modulus of a three-dimensional braided composite. O.C.

**A86-41052**

### BOLTED COMPOSITE REPAIRS SUBJECTED TO BIAXIAL OR SHEAR LOADS

R. E. BOHLMANN, G. D. RENIERI, and B. L. RILEY (McDonnell Aircraft Co; Saint Louis, MO) IN: Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984. Philadelphia, PA, American Society for Testing and Materials, 1986, p. 34-47. refs
(Contract N62269-81-C-0297)

The methodology to analyze bolted composite repairs subjected to biaxial or shear loads was developed. The methodology was incorporated into an existing McDonnell Aircraft Company (MCAIR) interactive computer program, BREPAIR, which was initially developed for uniaxial loading. The analysis determines bolt loads while accounting for hole clearances and determines patch and laminate strains for doubly symmetric finite regions where the damage is represented as a circular cutout. The analysis was verified by comparing predicted results to industry-recognized solutions for laminates containing circular holes (unrepaired), and to test results of an unrepaired and repaired shear panel. Results of this investigation verified that the methodology developed was a viable analytical tool for determining bolted repair designs for damaged laminates subjected to biaxial or shear loads. Author

### CHARACTERIZATION OF T300/V-378A GRAPHITE/BISMALEIMIDE FOR STRUCTURAL APPLICATIONS APPLICATIONS

R. L. RAMKUMAR, G. C. GRIMES, and S. J. KONG (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984. Philadelphia, PA, American Society for Testing and Materials, 1986, p. 48-63. Navy-sponsored research. refs

In the present evaluation of T300/V-378A graphite fiber/bismaleimide matrix composites in aircraft structures exposed to service temperatures in the 120-204 C range, the microstructure of cured laminates was examined in order to detect the presence of any process-induced defects, followed by moisture absorption studies and static testing of basic properties. Tests were also conducted on loaded and unloaded hole specimens under room-temperature-dry (RTD) and elevated-temperature-wet (ETW) conditions; impact damage tolerance was tested by measuring hard object impact energy levels. Multibay hat-stiffened flat shear panels were fabricated and subjected to pure-shear static and fatigue tests under RTD and ETW conditions. The data obtained were compared with graphite/epoxy laminate data, which indicated that V-378A bismaleimide is a viable alternative to epoxy matrices in ETW conditions. O.C.

**A86-41684**

### COMPOSITE REPAIR TECHNIQUES EXAMINED

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, May 1986, p. 20-24.

Techniques for repairing composite structure damage caused by surface impact damage, surface thermal blisters, internal voids, and delamination are studied. Visual inspections, tapping tests, ultrasonic inspection systems, and optical micrometers are utilized to locate and identify composite damage. Zone charts which explain the materials to be used in each section of the structure, indicate permissible repairs, and outline repair procedures are employed as the guidelines for damage repair. Various repair techniques such as prepreg or precured patches and epoxy injection are examined; the procedures for patching and the wet-layup process are described. Post-failure analysis using optical and scanning electron microscopy is discussed. I.F.

**A86-41685**
**THERMOPLASTIC COMPOSITES - DESIGN MATERIAL OF THE 1990S?**
D. J. HOLT Aerospace Engineering (ISSN 0736-2536), vol. 6, May 1986, p. 36-44.

The characteristics and uses of thermoplastic resins are discussed. The properties of thermoplastic resins are compared to thermoset resins and metals. It is observed that thermoplastic resins soften when heated and harden when cooled, their molecular structure remains linear before and after heating and cooling, they have increased temperature resistance, higher melting points, and are resistant to the solvents, fuels and oils used in the aerospace industry. The thermoplastic resins are manufactured by molding, filament winding, and pultrusion; the use of these techniques to produce aircraft components is examined. The properties of various resins applicable for use in advanced high-performance thermoplastic composites and the aircraft cabin interiors are described. The utilization of high-performance thermoplastic composites in the future ATF and the stealth bomber is proposed. I.F.

**A86-41988**
**INFLUENCE OF MOLYBDENUM, TUNGSTEN, AND COBALT ON THE CORROSION OF HIGH-TEMPERATURE STRENGTH NICKEL ALLOYS IN MOLTEN SALTS**
I. V. ORYSHICH and O. S. KOSTYRKO (AN USSR, Institut Problem Lit'ia, Kiev, Ukrainian SSR) (Metallovedenie i Termicheskaia Obrabotka Metallov, Oct. 1985, p. 21-25) Metal Science and Heat Treatment (ISSN 0026-0673), vol. 27, no. 9-10, March 1986, p. 740-746. Translation. refs

Specimens of ZhS6K, EP539, and EP958 high-temperature nickel alloys, which are commonly used in gas turbine, were tested for sulfide and chloride corrosion in molten salts based on sodium sulfate and sodium chloride. It is found that the addition of molybdenum, tungsten, and cobalt increases the resistance of the nickel alloys to sulfide corrosion but decreases their resistance to chloride corrosion. It is also shown that the amounts of molybdenum and tungsten required for maximum resistance to sulfide corrosion depend on the Cr content of the alloys. V.L.

**A86-42424**
**NEW ALLOYS FROM THE QUANTUM ENGINEER**
D. PETTIFOR New Scientist (ISSN 0028-6664), vol. 110, May 29, 1986, p. 48-51.

The contribution quantum mechanics is making to the design of aerospace alloys is described. The strength of the intermetallic particles in an Al matrix determines the properties of the alloy as a whole. The goal is to predict which intermetallic compounds will form and their properties. Quantum mechanics, in the form of Schoedinger's equation, allows predicting the structure and mechanical properties of an intermetallic. Recent data have shown that the average number of valence electrons per atom controls the formation of face-centered or body-centered lattices. Other factors are the differences in size and the electronegativity of the combined atoms. Studies have also revealed a dependency of the mechanical properties on the quantum mechanical bond energy and none on the ionic binding energy. Finally, techniques are outlined for using quantum mechanics to predict the properties and existence of ternary phases. M.S.K.

**A86-42610*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**EFFECT OF SILANE CONCENTRATION ON THE SUPERSONIC COMBUSTION OF A SILANE/METHANE MIXTURE**
G. B. NORTHAM, A. G. MCLAIN, G. L. PELLETT (NASA, Langley Research Center, Hampton, VA), and G. S. DISKIN (Vigyan Research Associates, Inc., Hampton, VA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 9 p. refs
(AIAA PAPER 86-1396)

A series of direct connect combustor tests was conducted to determine the effect of silane concentration on the supersonic combustion characteristics of silane/methane mixtures. Shock tube ignition delay data indicated more than an order of magnitude reduction in ignition delay times for both 10 and 20 percent silane/methane mixtures as compared to methane. The ignition delay time of the 10 percent mixture was only a factor of 2.3 greater than that of the 20 percent mixture. Supersonic combustion tests were conducted with the fuel injected into a model scramjet combustor. The combustor was mounted at the exit of a Mach 2 nozzle and a hydrogen fired heater was used to provide a variation in test gas total temperature. Tests using the 20 percent silane/methane mixture indicated considerable combustion enhancement when compared to methane alone. This mixture had an autoignition total temperature of 1650 R. This autoignition temperature can be contrasted with 2330 R for hydrogen and 1350 R for a 20 percent silane/hydrogen mixture in similar hardware. Methane without the silane additive did not autoignite in this configuration at total temperatures as high as 3900 R, the maximum temperature at which tests were conducted. Supersonic combustion tests with the silane concentration reduced to 10 percent indicated little improvement in combustion performance over pure methane. The addition of 20 percent silane to methane resulted in a pyrophoric fuel with good supersonic combustion performance. Reducing the silane concentration below this level, however, yielded a less pyrophoric fuel that exhibited poor supersonic combustion performance. Author

**NEW VISTAS IN THE DETERMINATION OF HYDROGEN IN AEROSPACE ENGINE METAL ALLOYS**
M. D. DANFORD (NASA, Marshall Space Flight Center, Huntsville, AL) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 6 p. refs
(AIAA PAPER 86-1479)

The application of diffusion theory to the analysis of hydrogen desorption data has been studied. From these analyses, important information concerning hydrogen solubilities and the nature of the hydrogen distributions in the metal has been obtained. Two nickel base alloys, Rene' 41 and Waspaloy, and one ferrous alloy, 4340 steel, were studied in this work. For the nickel base alloys, it was found that the hydrogen distributions after electrolytic charging conformed closely to those which would be predicted by diffusion theory. The hydrogen distributions in electrolytically charged 4340 steel, on the other hand, were essentially uniform in nature, which would not be predicted by diffusion theory. Finally, it has been found that the hydrogen desorption is completely explained by the nature of the hydrogen distribution in the metal, and that the 'fast' hydrogen is not due to surface and subsurface hydride formation, as was originally proposed. **A86-42712*#** Material Concepts, Inc., Columbus, Ohio.
**ADVANCED ROTARY ENGINE COMPONENTS UTILIZING FIBER REINFORCED MG CASTINGS**
D. GODDARD, W. WHITMAN, R. PUMPHREY (Material Concepts, Inc., Columbus, OH), and C.-M. LEE AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 7 p.
(AIAA PAPER 86-1559)

Under a two-phase program sponsored by NASA, the technology for producing advanced rotary engine components utilizing graphite fiber-reinforced magnesium alloy casting is being developed. In Phase I, the successful casting of a simulated intermediate housing was demonstrated. In Phase II, the goal is to produce an operating rotor housing. The effort involves generation of a material property data base, optimization of parameters, and development of wear- and corrosion-resistant cast surfaces and surface coatings. Results to date are described. Author

**A86-43134**
**PROTECTIVE COATING SYSTEMS FOR HIGH-TEMPERATURE GAS TURBINE COMPONENTS; PROCEEDINGS OF THE CONFERENCE, LONDON, ENGLAND, NOVEMBER 13, 14, 1984**
Conference sponsored by the Royal Society. Materials Science and Technology (ISSN 0267-0836), vol. 2, March 1986, 144 p. For individual items see A86-43135 to A86-43150.

Papers are presented on pack cementation processes, plasma spray coating processes, physical vapor deposition processes, quality control of high-temperature protective coatings, and the effect of environment on mechanical properties of coated superalloys and gas turbine blades. Also considered are structural stability of coatings, coating-substrate interactions, properties of thermal barrier coatings, laboratory tests for hot-corrosion studies, and correlation between laboratory corrosion rig testing and service experience. Other topics include the use of protective coatings in gas turbine engines, marine applications, coating service experience with industrial gas turbines, and the future direction of research on high-temperature coatings. Papers are also presented on protection against hot corrosion in marine gas turbines, evaluation of additive effects on hot corrosion of Ni-Cr and Co-Cr alloys, and coating/substrate interfaces in Ni-Cr-Al systems. R.R.

**A86-43147**
**USE OF PROTECTIVE COATINGS IN AERO GAS TURBINE ENGINES**
G. W. MEETHAM (Rolls-Royce, Ltd., Derby, England) (Royal Society, Conference on Protective Coating Systems for High-Temperature Gas Turbine Components, London, England, Nov. 13, 14, 1984) Materials Science and Technology (ISSN 0267-0836), vol. 2, March 1986, p. 290-294. refs

Protective coatings used in gas turbine engine turbine and combustion sections are reviewed, and coating selection factors for turbine rotor blade applications, service experience, and the influence of the blade operating environment, are discussed. Aluminide coatings, the most widely used, are inadequate in the most extreme temperature, corrosion and mechanical environments, and improved coatings such as MCrAlY and platinum aluminide coats are considered. Increased component life has been found in using thermal barrier coats for combustion liners, and the recent application of thermal barrier coats to stator vane platforms has necessitated the development of improved bond coats and ceramic overlays. Thermal barrier and corrosion resistant coating choice considerations are cost effectiveness and application specificity. R.R.

**COMPOSITE REPAIR AT THE NAVAL AIR REWORK FACILITY, NORTH ISLAND**
B. L. HALLOCK (U.S. Navy, Naval Air Rework Facility, San Diego, CA) AIAA and SOLE, Aerospace Maintenance Conference, 2nd, San Antonio, TX, May 21-23, 1986. 6 p. refs
(AIAA PAPER 86-1140)

This paper describes the methodology used to inspect, assess, and repair advanced composite components on Naval aircraft at the Naval Air Rework Facility, North Island. Future considerations for advanced composite repair and maintenance are also addressed. To repair a damaged advanced composite component requires a sequence of events: inspection, assessment, damage removal repair design, repair manufacture, repair installation, and finally repair verification. To date, honeycomb bonded advanced composite skins and monolithic skins have been repaired by the Rework Facility. The advanced composite repair program is expanding as more composite structured aircraft enter the fleet. As new development within the composite field lead to new applications, maintenance/supportability should be a major consideration. Well planned support is an essential part to the success of an aircraft program. Author

**EFFECT OF DIFFERENT HYDROGEN-INJECTION TECHNIQUES ON ITS BURNUP IN A SUPERSONIC AIR FLOW [VLIIANIE RAZLICHNYKH SPOSOBOV PODACHI VODORODA NA EGO VYGORANIE V SVERKHZVUKOVOM POTOKE VOZDUKHA]**
V. A. ZABAIKIN and A. M. LAZAREV (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) Akademiia Nauk SSSR, Sibirskoe Otdelenie, Izvestiia, Seriia Tekhnicheskie Nauki (ISSN 0002-3434), March 1986, p. 44-49. In Russian. refs

The technique used to inject a gaseous fuel into a supersonic oxidizer flow has an important effect on flow pressure losses, flame stabilization, and combustion efficiency during supersonic combustion. In the present study, an experiment was conducted to measure hydrogen combustion efficiency for different injection techniques at a temperature of the supersonic air flow above 1000 K. Three types of injectors were considered: straight-flow, vortex-type, and a device yielding a fan of perpendicular jets. The data confirm the decisive role of the injection method and the wave structure of the jets on combustion efficiency in a hydrogen flame. B.J.

Composite structures with a honeycomb core and characterized by lightweight and excellent fire resistance are provided. These sandwich structures employ facesheets made up of bismaleimide-vinyl styrylpyridine copolymers with fiber reinforcement such as carbon fiber reinforcement. In preferred embodiments the facesheets are over layered with a decorative film. The properties of these composites make them attractive materials of construction aircraft and spacecraft. NASA

Liquid chromatography with a UV detector to assess resins used in the Airbus was tested on two resins. Results show that the chromatographic method permits an adequate separation of the different components of both resins, though the fact of having to perform a gradient limits the integration accuracy of the different peaks and therefore supposes a limitation of the method. None of the two wavelengths used (220 and 230 nm) seems to have any influence on the accuracy of the results obtained. ESA

The Technology Transfer program assists in the utilization and integration of the laser facility in the manufacturing of naval ordnance components and systems. This assistance consists of targeting workpieces and production steps suitable for laser processing in terms of cost effectiveness and quality enhancement, the development of techniques and procedures for such processing and the establishment of processing parameters and other pertinent data. The work is related to laser surface transformation hardening of steels. The response of a number of frequently used steels to such laser processing has been determined over a wide range of processing parameters. Models and calculator programs for the prediction of laser hardening have been developed and tested, and the necessary thermophysical constants of the various materials determined by statistical and empirical means. In addition to the transformation hardening survey, process development work relating to the laser hardfacing of aircraft carrier catapult rails has been performed, and preliminary techniques and processing data established for different combinations of hardfacing alloys/substrate materials. Described are the theoretical principles of the materials technology for electrical appliances used in aviation instrumentation. Major attention has been paid to the structure and properties of metals and alloys used in modern aviation instrumentation. The authors have elaborated the relationship between the structure and physiochemical properties of alloys. Various methods of developing special properties in alloys have been described. A considerable part of the book has been devoted to the study of special-purpose alloys such as soft and hard magnetic materials, ferrites, alloys with special thermal and electrical properties, and semiconductors. Students in aviation institutes will find the book very useful. Aviation, electrical and mechanical engineers engaged in the development of electrical appliances will also benefit from the book. GRA

(Contract MOD-RAE(F)MT-69/2/10)
(NPL-DMA(A)113; ISSN-0143-7313; ESA-86-97132) Avail: Issuing Activity

A photoelastic method for characterizing the internal stresses in crosslinked PMMA acrylic aircraft materials and windows was developed. The time-dependence of optical birefringence during creep or relaxation tests at different temperatures suggests that three nonequilibrium internal stress components operate: stress characteristic of the molecular orientation produced by stretching at high temperature; a glasslike distortional stress; and a stress arising from molecular conformational changes generated by the beta relaxation process in PMMA. A light-scattering technique was used to characterize internal stresses from temperature-dependent birefringence measurements in biaxially oriented materials. Levels of molecular orientation in biaxially stretched sheets and windows correspond to an orientational stress of 2 + or - 0.2 MPa along each of the stretching directions. Internal stresses in the crosslinked acrylic materials can be assessed from surface acoustic wave velocity. ESA

Many dump combustors exhibit low frequency longitudinal combustion instability in the frequency range of 80 to 300 Hz. Although the exact causes of combustion instability are not known precisely, it is generally accepted that the interaction of the shock induced pressure pulsation and the coherent vortex shedding at the dump plane induces combustion instability. When the coherence of the shear layer at the dump plane is disrupted either by gasjets or by upstream protrusions the effect of combustion instability is found to be minimized. The control system suggested here is based upon the idea of disrupting the shear layer at the dump plane by means of pulsing gasjets. The control system senses the critical combination of frequency, amplitude and phase angle upstream of the combustor and actuates the gasjets at the dump plane at an appropriate combination of frequency, amplitude and phase angle to partially negate the effect of upstream pressure pulsation. Experiments in two laboratory scale two-dimensional (6.4 cm x 3.8 cm and 7.6 cm x 2.54 cm) dump combustors using premixed propane-air mixtures show the feasibility of reducing chamber pressure amplitude by such a technique. (AD-A166429; AFWAL-TR-85-4093) Avail: NTIS HC A05/MF A01 CSCL 11F

Fatigue crack propagation rates have been measured for two titanium-based aeroengine disc alloys using compact tension test pieces. The loading block employed simulates two features of the engine flight pattern. A major stress cycle represents the start-stop operation which leads to low cycle fatigue. In-flight vibrations, which may give rise to high cycle fatigue, are represented by superimposed minor cycles of high frequency. With a lifting policy of retirement for cause the useful lives of blades and discs are limited by the onset of minor cycle crack growth. The threshold values associated with the minor cycles have been used to predict this event. Similarly the method of linear summation has been used to predict the subsequent fatigue crack growth rates. These predictions are successful for Ti-6A1-4V, whilst for Ti-5331S they are found to be either accurate or safe. Although Ti-5331S displays a marginally greater resistance to the onset of minor cycle crack growth, of greater significance is its reduced crack growth rates prior to this event. As a consequence components fabricated from Ti-5331S will exhibit longer fatigue crack propagation lives when subjected to the conjoint action of high and low cycle fatigue. GRA

Avail: US Patent and Trademark Office CSCL 11C

A polyimide film that is approximately 90% transparent at 500 nm, useful for thermal protective coatings and solar cells, and the processes for preparing the same by thermal and chemical conversion are disclosed. An essential feature for achieving maximum optical transparency films requires utilizing recrystallized and/or sublimated specific aromatic diamines and dianhydride monomers and introducing phenoxy or thiophenyl separator groups and isomeric m,m' or o,p'-oriented diamines into the polymer molecular structure. The incorporation of these groups in the polymer structure serves to separate the chromaphoric centers and reduce the formation of inter-chain and intra-chain charge transfer complexes which normally cause absorptions in the UV-visible range. The films may be obtained by hand, brushing, casting, or spraying a layer of polyamic acid solutions onto a surface and thermally converting the applied layer to the polyimide, or the polyamic acid solution can be chemically converted to the polyimide, subsequentially dissolved in an organic solvent, and applied as a polyimide film layer with the solvent therein thermally removed. A common oil is now used in both the engines and transmissions of virtually all U.S military helicopters. While this provides significant logistic advantages, these advantages are attained only by compromising the optimization of the oil for either system. The results of two studies undertaken to determine what benefits would accure through the development of a special oil tailored specifically to meet the unique requirements of high-speed, heavily loaded helicopter transmission systems are summarized. These studies, conducted independently by two major helicopter manufacturers under the direction of the Naval Air Propulsion Center, addressed specific problem areas as related to typical production aircraft in order to reach well-documented conclusions. In addition, the effect of the availability of such a special gearbox lubricant on the development of other advanced-technology components was evaluated and documented. Author

High performance gears in the modern helicopter must operate at ever increasing torque and RPM. A major consequence of this increased torque and RPM is a significant increase in the surface temperature and increased scuffing of the gears. In response to this problem, Boeing-Vertol introduced a new class of steel (hot work tool steel) as a high performance aircraft gear steel and started a trend which all subsequent work has confirmed to be a correct decision. The three most prominent candidate critical high temperature aircraft gear steels including Vasco X-2M, CARTECH X-53 (PYROWEAR 53), and CBS600 are discussed. The heat treatment responses of these alloys will be compared. Three additional alloys (M50NiL, CBS1000M, and AMAX B) are discussed in less detail. Author

**FUTURE TRENDS IN HELICOPTER TRANSMISSION LUBRICANTS**

H. A. SPIKES *In* AGARD Aircraft and Bearing Tribological Systems 10 p Feb. 1986
Avail: NTIS HC A11/MF A01

Some recent fundamental studies relating to the lubrication of helicopter transmissions are presented, as well as implications for future oil development. The resulting enhanced understanding of lubrication mechanisms has shown that real potential exists both for improved performance and for the ability to cater to higher temperatures, by means of the formulation and use of improved transmission oils. If such benefits are recognized and if the new knowledge is correctly applied, there is no reason why helicopter gearbox reliability should not be appreciably improved by the end of the decade. **SCORING TESTS OF AIRCRAFT TRANSMISSION LUBRICANTS AT HIGH SPEEDS AND HIGH TEMPERATURES**
H. WINTER and K. MICHAELIS *In* AGARD Aircraft and Bearing Tribological Systems 9 p Feb. 1986
Avail: NTIS HC A11/MF A01

Aircraft engines always contain gears that have to be lubricated under conditions of high speeds and extremely high temperatures. In this field of application scoring damage is likely to occur. In Europe and partly also in the USA the scoring load capacity of gear oils is expressed in terms of FZG Scoring Load Stage. The FZG Gear Test Rig is described. The normal test procedure A/8.3/90 as standardized in DIN 51 354 using A-type gears at a pitch line velocity of $v = 8.3$ m/s and a starting oil temperature of 90 C is presented. A modified procedure at double speed and increased oil temperature A/16.6/140 is discussed. Because of the high costs and problems with the availability of test gears a modified FZG Ryder Test was developed. The method is presented and comparative results of typical aircraft engine oils in the FZG, the FZG-Ryder and the original Ryder Gear Test are shown. From this experience it becomes obvious that alternative test methods for the evaluation of scoring load capacity of aircraft transmission lubricants can be available in the near future. Author

Theory suggests that, if a target can be modeled as a rigid constellation of point scatterers, the RCS pattern over a certain aspect change can be used to produce a one-dimensional image. The results for actual measured RCS patterns, however, are not promising. This is illustrated by processing on 4 s of echo data obtained from a Boeing 737 in straight flight, during which its aspect change is 2 deg. The conclusion might be that, for the application considered, aircraft cannot be modeled as a rigid constellation of point scatterers; this is partly due to the treatment of a three-dimensional target as a line target. **THE COMBINED EFFECTS OF STRESS AND MOISTURE ON THE STRUCTURAL INTEGRITY OF COMPOSITES**
C. HIEL, A. CARDON (Brussel, Vrije Universiteit, Brussels, Belgium), M. ADAMSON, and H. NELSON (NASA, Ames Research Center, Moffett Field, CA) IN: Developments in the science and technology of composite materials; Proceedings of the First European Conference on Composite Materials and Exhibition, Bordeaux, France, September 24-27, 1985 . Bordeaux, France, Association Europeenne des Materiaux Composites, 1985, p. 193-200. refs

A variational approach is used to model the moisture content and distribution profiles which cause swelling in polymers and composites which are used as aircraft structural components. The moisture intrusion stems from humidity, which makes the problem one of diffusion of mass from the environment into a semiinfinite plate with a given diffusion coefficient and thickness. Lagrangian, ordinary differential equations are defined for the mass diffusion, including driving force, mass potential and volume dissipation expressions. Account is taken of the effects of stress on diffusivity, including the dilatational stress caused by inhomogeneous swelling of the material. It is noted that material near the top and bottom of a part undergoes the most swelling, and the evolution of moisture diffusion in the materials is traced. Finally, experimental data are used to define differential equations for predicting the final moisture distribution within the material. M.S.K.

**A MODEL FOR THE EQUIVALENT BENDING CHARACTERISTICS OF A COMPOSITE BEAM [CALCUL DES CARACTERISTIQUES EQUIVALENTES DE TORSION POUR UNE POUTRE COMPOSITE]**
J.-J. BARRAU (Ecole Nationale Superieure de l'Aeronautique et de l'Espace, Toulouse, France) and D. GAY (Toulouse III, Universite, France) IN: Developments in the science and technology of composite materials; Proceedings of the First European Conference on Composite Materials and Exhibition, Bordeaux, France, September 24-27, 1985 . Bordeaux, France, Association Europeenne des Materiaux Composites, 1985, p. 373-378. In French.

A warping function is employed to obtain the torsional stiffness and the shear center of a composite beam in order to treat a composite helicopter blade with a model for a cylindrical beam applied to a homogeneous material. Equations are defined for the displacement field of the blade under rotation and for equilibrium conditions at the interface between the composite and another material and between the composite and the free surface. Bending forces are only exerted when the system is in equilibrium and always perpendicular to the blade. The bending stiffness is obtained by integration of the moments exerted by the tangential stresses. A finite element method is then introduced for numerical solution of the beam under bending stress. Techniques for accelerating the convergence using either triagonal or one-dimensional elements in the computations are discussed. A sample problem is worked out for a carbon composite blade, showing that the model provides results within the bounds of experimental uncertainty. M.S.K.

### ROBOTIC NONDESTRUCTIVE INSPECTION OF AEROSPACE STRUCTURES

G. L. WORKMAN and W. TEOH (Alabama, University, Huntsville) IN: Space tech; Proceedings of the Conference and Exposition, Anaheim, CA, September 23-25, 1985 . Dearborn, MI, Society of Manufacturing Engineers, 1985, p. 4-11 to 4-24.

Nondestructive inspection of critical components and systems used in aerospace structures requires that the inspection system provide a consistent scanning capability to determine structural integrity in a timely and cost-effective manner. The scanning system may be single-ended, as in pulse echo electronics or eddy currents, or double-ended as in through transmission ultrasonics or X-ray applications. Many of the scanning systems developed in the past for automated nondestructive inspection of large structures such as aircraft wings or fuselages usually are designed specifically for that application and can be very expensive. There is no built-in flexibility for scanning other types of structures; hence there is a need for general purpose scanning systems which use the industrial robot as a programmable scanning device. Author

### A STUDY OF OPTIMIZING CUTTING TOOL PERFORMANCE IN HIGH TENSILE STRENGTH MATERIALS

J. GIEBLER (Prototyp-Werk GmbH, Zell am Harmersbach, West Germany) IN: Space tech; Proceedings of the Conference and Exposition, Anaheim, CA, September 23-25, 1985 . Dearborn, MI, Society of Manufacturing Engineers, 1985, p. 9-19 to 9-29.

This study shows the influences that different machining variables, in particular feed rates, have on cutting life and surface finish when milling or threading materials such as stainless steel, titanium and Inconel. Optimum machining values are easily determined by measuring the peak-to-valley heights of the surface texture finish. The study evaluates the performance of form threading Inconel 718 and the resulting advantages of such a procedure in practical application. Through the use of computer-aided design, special surface treatments and the application of the proper oils, the forming of Inconel 718 may achieve a high degree of success. Author

### SAMPLING OF SOLID PARTICLES IN CLOUDS

F. FEUILLEBOIS, A. LASEK, and M.-F. SCIBILIA (CNRS, Laboratoire d'Aerothermique, Meudon, France) IN: Gas-solid flows - 1986; Proceedings of the Fourth Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 11-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 139-144. refs

This paper is concerned with the sampling of small solid particles from clouds by an airborne apparatus to be mounted on an airplane for meteorological investigations. In the airborne experiment the particles entering the test tube should be as representative as possible of the upstream conditions ahead of the plane, in the real cloud. Due to the inertia of the particles, the proportion of the different sizes of particles entering the test tube depends on the location of the tube mouth. A method of calculating the real concentration in particles of different sizes is presented, using the results of measurements executed during the flight of an airplane in a cloud. Two geometries are considered: the nose of the airplane, represented schematically by a hemisphere, and a wing represented by a (2D) Joukowski profile which matches well a NACA 0015 profile on its leading edge. ### DILUTE GAS-PARTICLE FLOW IN A CENTRIFUGAL COMPRESSOR IMPELLER

H. LIU and C. MA (Xian Jiaotong University, Xian, People's Republic of China) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 67-73. refs

This paper presents computational results of particle trajectories of a dilute gas-particle flow in a centrifugal compressor impeller. The particle trajectory calculations are based on a three-dimensional gas flow field. Results show that pressure surfaces of blades and the joint regions of the hub and the pressure surfaces at the inlet and the outlet of the blade passage experience severe particle impacts. Considerations are also given to effects of material density and rebound characteristic on the particle motion. Author

### PARTICLE TRAJECTORIES IN FULL 3D FLOW FIELD OF TURBOMACHINERY

Z. G. LING (Shanghai University of Engineering Sciences, People's Republic of China) and S. L. HUANG (Chengdu University of Science and Technology, People's Republic of China) IN: Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 . New York, American Society of Mechanical Engineers, 1986, p. 75-80. refs

In this paper, particle trajectories in turbine stages are predicted in connection with full 3D gas flow field solved by the time marching method. The secondary flow effect is also partially considered by assuming a total pressure distribution at the inlet of the moving blade row. The results show that passage vortex due to secondary flow will cause upward and downward divergence of particle trajectories at the rear part of near blade pressure surface, evidenced by the real appearance of eroded trace on turbine blade after a long period of operation. Author

### DIGITAL SIMULATION OF REGULATED ELECTRICAL POWER SUPPLIES FOR MILITARY APPLICATIONS

V. V. VADHER and I. R. SMITH (Loughborough University of Technology, England) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 2 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 511-516.

The paper presents a generalized model for a regulated generator (for supplying power on board aircraft, military vehicles, or ships) which copes with the combined loading conditions likely to be encountered. The model is described in relation to an m-phase star-connected generator. The use of an additional but simple connection matrix is all that is necessary to enable the corresponding delta-connected machine to be considered. Simulation results are presented. B.J.

### LARGE AND SMALL STRUCTURES IN THE COMPUTATION OF TRANSITION TO FULLY DEVELOPED TURBULENT FLOWS

P. PERRIER (Avions Marcel Dassault-Breguet Aviation, Saint-Cloud, France) IN: Macroscopic modelling of turbulent flows; Proceedings of the Workshop, Valbonne, France, December 10-14, 1984 . Berlin and New York, Springer-Verlag, 1985, p. 32-44. refs

How the large structures of turbulent flows have to be modellized, especially from the beginning of their onset, without any hypothesis based on fully developed turbulence, is discussed. A completely mathematical derived model is presented, given by homogenization theory. That model would be able to evaluate the size and behavior of large structures in the presence of statistical equilibrium of small structures. Author

### MODELLING OF THREE-DIMENSIONAL SHOCK WAVE TURBULENT BOUNDARY LAYER INTERACTIONS

D. D. KNIGHT (Rutgers University, New Brunswick, NJ) IN: Macroscopic modelling of turbulent flows; Proceedings of the Workshop, Valbonne, France, December 10-14, 1984 . Berlin and New York, Springer-Verlag, 1985, p. 177-201. NASA-supported research. refs

(Contract AF-AFOSR-82-0040)

The accuracy of numerical computations of the three-dimensional sharp fin flow field using the Reynolds-averaged Navier-Stokes equations is examined. Computed flows are compared with a set of benchmark experiments at Mach 3 for two different Reynolds numbers. A detailed comparison is performed between experimental data and separate computational results for the three-dimensional sharp fin for a 10 deg fin angle in order to examine the accuracy of two different turbulence models. The computed surface pressure for the fin at a 20 deg angle is compared with recent experimental data. The computed yaw angle profiles are shown to be sensitive to the turbulence model. In the immediate vicinity of the surface, the calculated results using the Baldwin-Lomax (1978) model are in better agreement with the data than the Jones-Launder (1972) model. Within the inner portion of the boundary layer, both models tend to underpredict the yaw angle. C.D.

### PROBABILITY OF DETECTION OF FLAWS IN A GAS TURBINE ENGINE COMPONENT USING ELECTRIC CURRENT PERTURBATION

G. L. BURKHARDT and R. E. BEISSNER (Southwest Research Institute, San Antonio, TX) IN: Review of progress in quantitative nondestructive evaluation. Volume 4A - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 333-341. USAF-supported research.

The electric-current perturbation technique was used to estimate the probability of detection (POD) of surface flaws in blade slots of a F-100 turbofan first-stage Ti 6-2-4-6 fan disk with the objective of reliable flaw detection. At the retirement-for-cause target flaw size of 0.010-in-long and 0.005-in-deep, EDM slots were used to simulate fatigue cracks. POD as a function of flaw size was estimated from the POD data obtained from experimentally determined probability density functions for background and flaw signals. Depending on the scan track spacing, the POD was found to be close to 100 percent for flaw lengths of about 0.011 to 0.013 in. In parts with background noise lower than that in the F-100 first-stage fan disk blade slots, a higher POD for even smaller flaws can be achieved. I.S.

### APPLICATION OF A COMPUTER MODEL TO ELECTRIC CURRENT PERTURBATION PROBE DESIGN

R. E. BEISSNER and G. L. BURKHARDT (Southwest Research Institute, San Antonio, TX) IN: Review of progress in quantitative nondestructive evaluation. Volume 4A - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 371-378.

(Contract W-7405-ENG-82)

The use of computer models of electromagnetic NDE probes to aid in probe design and applications is illustrated using examples. The miniaturization of the type of probe being considered which is of the electric current perturbation design, is addressed, considering the flaw responses of alternative configurations and their relevance to the inspection of a certain feature of an F100 engine part. Then, the use of the computer models to help determine the optimum frequency for subsurface flaw detection in the presence of near-surface anomalies that tend to mask the flaw signal is addressed, including the choice of operating frequency and phase shift to maximize the signal-to-noise ratio. C.D.

### AUTOMATIC EDDY CURRENT INSPECTION OF ANTIROTATION WINDOWS IN F100 ENGINE COMPRESSOR AIR SEALS

W. HOPPE and D. STUBBS (Systems Research Laboratories, Inc., Dayton, OH) IN: Review of progress in quantitative nondestructive evaluation. Volume 4A - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 463-474.

(Contract F33615-81-C-5002)

A procedure for separating the notch signal detected by a probe from the geometry signal is proposed. A differential pencil probe is utilized to scan an aircraft engine air seal that contains six antirotation windows, three of which contain electrical discharge machine notches. The problems with separating the notch signal from the geometry signal by subtracting the geometry signal from the inspection signal or filtering data using analog digital filters are discussed. The difference between the mean frequencies of the vertical and horizontal components of the impedance plane versus time detected in the notch signal is examined. It is observed that the geometry signal is in both the time and frequency domains. The horizontal and vertical components are calculated and a correlation between the components is obtained. Examples are presented revealing the applicability of this procedure for detecting notch signals based on differences in the vertical and horizontal components of the impedance plane. I.F.

**A86-41582**

### AUTOMATIC EDDY CURRENT HOLE CENTERING FOR AIRCRAFT ENGINE COMPONENTS

D. STUBBS, W. HOPPE, and B. OLDING (Systems Research Laboratories, Inc., Dayton, OH) IN: Review of progress in quantitative nondestructive evaluation. Volume 4A - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 475-481.
(Contract F33615-81-C-5002)

An algorithm for centering a rotating eddy current hole probe over a hole is presented. Results show this algorithm to be fast, accurate, reliable, and flexible for a wide range of probe diameters, with attainable accuracies better than 0.0005 arcsec. Evidence is presented showing the applicability of this algorithm to cases where the probe is off center by more than the probe diameter. Data are also presented which show the ability of the algorithm to compensate for nearby geometries that adversely affect the centering procedure. C.D.

### AN ANALYSIS OF ACOUSTIC EMISSION DETECTED DURING FATIGUE TESTING OF AN AIRCRAFT

C. M. SCALA, R. A. COYLE, and S. J. BOWLES (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) IN: Review of progress in quantitative nondestructive evaluation. Volume 4B - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 709-718. refs

Preliminary results are presented from an evaluation of the effectiveness of in-flight acoustic emission (AE) monitoring of fatigue cracking in the wing spars of Mirage aircraft. Various types of AE sensors were examined prior to selection of thin-disk and conical sensors to aid in the pattern recognition signal processing. The pattern recognition codes provided the capability of discerning among saturation data, signal rise-time and duration data, time-domain shape factors, and spectral data, and allowed the performance of autocorrelations. Laboratory-scale pretests characterized inclusion fracture signals as opposed to those from gas flow, em interference, mechanical noise, etc. Sensors were then inserted into wing spar fastener holes of two aircraft wings that were monitored in-flight from 1981-82. Data from one wing proved insufficient for distinguishing between the waveforms emitted by inclusion fractures and from fretting sources. Additional trials were planned which may provide the necessary data for improving the applicability of the AE data. M.S.K.

### A FIBER OPTIC DAMAGE MONITOR

C. K. JEN, P. CIELO (National Research Council of Canada, Industrial Materials Research Institute, Boucherville, Canada), G. W. FARNELL, and M. PARKER (McGill University, Montreal, Canada) IN: Review of progress in quantitative nondestructive evaluation. Volume 4B - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 831-838. NSERC-supported research.

A simplified fiber-optic damage monitoring system for on-line assessments of the condition of composite structural materials in F/A-18 fighters is described. Optical fibers are implanted into the composite mesh in a configuration with horizontal and vertical orientations When light is pumped into the fibers, and failure of transmittance in either the x- or y-coordinates indicates the location of a defect at that coordinate, as revealed by the fiber damage. Attaching photodiodes to the optic fibers and connecting the entire system to a video camera and computer permits on-line monitoring of the mesh-holding panels. Sample results are provided from a system with multimode step index fibers, a VAX 11/780 computer and a video camera with a 488 x 380 cell photodiode array. Image subtraction is an effective means for fast determination of the identities of broken fibers by comparisons of images of arrays of original and damaged fibers. M.S.K.

### APPLICATION OF MEDICAL COMPUTED TOMOGRAPHY (CT) SCANNERS TO ADVANCED AEROSPACE COMPOSITES

K. D. FRIDDELL, A. R. LOWREY, and B. M. LEMPRIERE (Boeing Aerospace Co., Seattle, WA) IN: Review of progress in quantitative nondestructive evaluation. Volume 4B - Proceedings of the Eleventh Annual Review, San Diego, CA, July 8-13, 1984 . New York, Plenum Press, 1985, p. 1239-1245; Discussion, p. 1246.

Computed tomography (CT), developed for medical scans of the human body, is based on the properties of carbon, which is fortuitous for adaptations to NDE of carbon composite materials (CCM). The defects which must be detected in CCM are wrinkling or damage to plies, drying, porosity and microcracks. In attempts to calibrate a CT device for NDE of CCM, specimens were prepared which were composed mainly of compacted powder with water, glycerine and plexiglass additives. Gray scales for density were obtained and compared with wafer-thin samples of the specimens. The technique proved useful not only for measuring density, but also for detecting microcracking. Furthermore, stress tests and subsequent scans of ring-shaped samples demonstrated that the strength of a piece as a whole was dependent on the weakest site, i.e., the lowest density region. M.S.K.

### CONSTITUTIVE MODELING OF CYCLIC PLASTICITY AND CREEP, USING AN INTERNAL TIME CONCEPT

O. WATANABE and S. N. ATLURI (Georgia Institute of Technology, Atlanta) International Journal of Plasticity (ISSN 0749-6419), vol. 2, no. 2, 1986, p. 107-134. refs
(Contract NAG3-46)

Using the concept of an internal time as related to plastic strains, a differential stress-strain relation for elastoplasticity is rederived, such that (1) the concept of a yield-surface is retained; (2) the definitions of elastic and plastic processes are analogous to those in classical plasticity theory; and (3) its computational implementation, via a 'tangent-stiffness' finite element method and a 'generalized-midpoint-radial-return' stress-integration algorithm, is simple and efficient. Also, using the concept of an internal time, as related to both the inelastic strains as well as the Newtonian time, a constitutive model for creep-plasticity interaction, is discussed. The problem of modeling experimental data for plasticity and creep, by the present analytical relations, as accurately as desired, is discussed. Numerical examples which illustrate the validity of the present relations are presented for the cases of cyclic plasticity and creep. Author

**WEIBULL-DISTRIBUTED GROUND CLUTTER IN THE FREQUENCY DOMAIN**

M. SEKINE, T. MUSHA (Tokyo Institute of Technology, Yokohama, Japan), Y. TOMITA, T. HAGISAWA, and E. KIUCHI (NEC Corp., Radio Application Div., Fuchu, Japan) Institute of Electronics and Communication Engineers of Japan, Transactions, Section E (English) (ISSN 0387-236X), vol. E68, June 1985, p. 365-370. refs

Ground clutter from cultivated land was measured using an L-band long range air-route surveillance radar at very low grazing angles, between 0.21 and 0.32 deg. It is shown that the Weibull-distributed ground clutter obeys a Weibull distribution in the frequency domain after processing by the discrete Fourier transform. Thus the new Weibull/CFAR should be considered to suppress such clutter in the frequency domain. Author

**A LARGE DISPLACEMENT FORMULATION FOR ANISOTROPIC BEAM ANALYSIS**

M. BORN and T. MERLINI (Milano, Politecnico, Milan, Italy) Meccanica (ISSN 0025-6455), vol. 21, March 1986, p. 30-37. refs

The displacement of a slender prismatic elastic beam, with constant properties along the generatrices and anisotropic and inhomogeneous properties in the cross section, in response to loading at the extreme cross-section surfaces is investigated analytically, expanding on the linear theory of Giavotto et al. (1983). The linear theory is shown to provide the correct elastic section properties and section warping characteristics; the nonlinear formulation gives a generalized geometric section stiffness which takes prestress into account. These results can then be used to construct the elastic and geometric stiffness matrices of a nonlinear beam element suitable for large-displacement analysis of structures such as helicopter rotor blades. T.K.

**A DETAILED NUMERICAL MODEL OF A SUPERSONIC REACTING MIXING LAYER**

J. P. DRUMMOND, R. C. ROGERS, and M. Y. HUSSAINI (NASA, Langley Research Center, Hampton, VA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 18 p. refs

(AIAA PAPER 86-1427)

A current research effort is underway at the NASA Langley Research Center to achieve a detailed understanding of important phenomena present when a supersonic flow undergoes chemical reaction. A computer program has been developed to study the details of such flows. The program has been constructed to consider the multicomponent diffusion and convection of important species, the finite-rate reaction of these species, and the resulting interaction between the fluid mechanics and chemistry. Code results from the analysis of a spatially developing and reacting mixing layer are presented, and conclusions are drawn regarding the structure of the evolving layer and its associated flame. **REDISTRIBUTION OF AN INLET TEMPERATURE DISTORTION IN AN AXIAL FLOW TURBINE STAGE**

T. L. BUTLER, O. P. SHARMA, H. D. JOSLYN, and R. P. DRING (United Technologies Corp., East Hartford, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. refs

(AIAA PAPER 86-1468)

The results of an experimental program aimed at determining the extent of the redistribution of an inlet temperature distortion in an axial flow turbine stage are presented. The program was conducted in a large-scale, low speed, single stage turbine where air, seeded with CO2 was introduced at one circumferential location upstream of the inlet guide vane. The migration of the seeded air through the turbine was determined by sensing CO2 concentration inside the stage. A temperature distortion was introduced by heating the seeded air. The CO2 concentration contours measured downstream of the vane showed little change with heating, indicating that the vane flowfield was relatively unaffected by the introduction of the temperature distortion. However, the CO2 contours observed on the rotor airfoil surfaces for the case with inlet heating indicated segregation of hot and cold gas, with the higher temperature gas migrating to the pressure side and the lower temperature gas migrating to the suction side. Significant increases in rotor secondary flow were also observed. Author

**SIMULATION OF ENGINE INSTALLATION FLOWFIELDS USING A THREE-DIMENSIONAL EULER/NAVIER-STOKES ALGORITHM**

J. VADYAK and M. J. SMITH (Lockheed-Georgia Co., Marietta) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 14 p. Research sponsored by the Lockheed Independent Research and Development Program. refs

(AIAA PAPER 86-1537)

A computer analysis has been developed for calculating the steady (or unsteady) three-dimensional flowfield for engine installations. This algorithm, called ENS3D, can compute the engine installation flowfield for subsonic, transonic or supersonic free-stream speeds. The algorithm can solve either the Euler equations for inviscid flow, the thin-shear-layer Navier-Stokes equations for viscous flow, or the full Navier-Stokes equations for viscous flow. The flowfield solution is determined on a body-fitted numerically-generated computational grid. A fully-implicit alternating-direction-implicit method is employed for solution of the finite-difference equations. For viscous computations, a two-layer eddy-viscosity turbulence model is used to achieve mathematical closure. For the present application, the algorithm is applied to compute transport engine installation flowfields at subsonic and transonic free-stream speeds. Author

**A86-42749#**

**INTERACTIONS BETWEEN ACOUSTICS AND VORTEX STRUCTURES IN A CENTRAL DUMP COMBUSTOR**

K. KAILASANATH, J. GARDNER, J. BORIS, and E. ORAN (U.S. Navy, Naval Research Laboratory, Washington, DC) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 10 p. Navy-sponsored research. refs

(AIAA PAPER 86-1609)

Results are presented of numerical simulations performed to isolate and study the interaction between acoustic waves and large scale vortex structures in a central-dump ramjet combustor. A strong coupling between the acoustic modes of the chamber and large scale vortex structures is observed. The results in the early part of the calculations indicate unforced natural vortex growth near the entrance to the combustor (dump plane) at a frequency close to the acoustic frequency. With time, the acoustic modes shift the frequency of the most amplified mode near the dump plane into resonance with the acoustic mode. The location in space where the modes grow can also be shifted by acoustic forcing. An interesting feature observed in the simulations is a low frequency mode corresponding to the arrival of the merged vortex structures at the choked exit. This mode causes major changes in the merging pattern of the vortices. Author

**FURTHER DEVELOPMENT OF THE DYNAMIC GAS TEMPERATURE MEASUREMENT SYSTEM**

D. L. ELMORE, W. W. ROBINSON, and W. B. WATKINS (United Technologies Corp., Pratt and Whitney, West Palm Beach, FL) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 8 p.
(Contract NAS3-24228)
(AIAA PAPER 86-1648)

A compensated thermocouple measurement method was experimentally verified. Dynamic signal content from an atmospheric pressure laboratory burner was measured by the dynamic temperature sensor and a relatively delicate fine-wire resistance thermometer. Compensated data from the two dynamic temperature sensor thermoelements were compared with the compensated fine-wire data in the frequency domain. Absolute differences between spectral line amplitudes measured with different sensors are small relative to the mean temperature and verify the compenation method. Increases in precision of the measurement method require optimization of several factors, and directions for further work are identified. Author

**R&M 2000 - A LOOK TO THE FUTURE**

F. S. GOODELL and M. P. SMITH (USAF, Office of the Special Assistant for Reliability and Maintainability, Washington, DC) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 7 p. refs
(AIAA PAPER 86-1668)

The U.S. Air Force's Reliability and Maintainability 2000 (R&M 2000) program has as its goals the enhancement of warfighting capability through increased combat support structure survivability measures that reduce mobility requirements for deploying units, decrease manpower requirements for each unit of output, and decrease costs. A key aspect of R&M 2000's implementation strategy is fault isolation down to shop replaceable units system levels in VHSIC technicology. R&M 2000 methods led to the cancellation of a radar warning receiver program that did not meet performance requirements, and resulted in the restructuring of the Low Altitude Navigation and Targeting IR System for Night. O.C.

**DAMAGE TOLERANCE ASSESSMENT OF AIRCRAFT ATTACHMENT LUGS**

T. R. BRUSSAT (Lockheed-California Co., Burbank, CA), K. KATHIRESAN (AT&T Bell Laboratories, Marietta, GA), and J. L. RUDD (USAF, Wright Aeronautical Laboratory, Wright-Patterson AFB, OH) Engineering Fracture Mechanics (ISSN 0013-7944), vol. 23, no. 6, 1986, p. 1067-1084. refs

A comprehensive development of damage tolerance design criteria and analysis methods for aircraft attachment lugs is presented. A concise summary is presented of analysis methods and their correlation with test results from 236 fatigue crack growth and 16 residual strength tests of attachment lugs covering a wide variety of design variables. Logic is presented for the selection of an initial flaw size criterion, based upon a survey of cracking data, assessment of NDI capabilities and consideration of manufacturing quality for aircraft attachment lugs. Data are presented showing the damage tolerance of double element (redundant) lugs with a single initial flaw, but other data are discussed showing a high likelihood of multiple fatigue cracking in lugs. Logic is then presented for initial flaw size criteria for multi-load-path attachment lugs which give appropriate credit for redundancy without ignoring the possibility of multiple cracking. Author

**HOLOGRAPHIC MODE SHAPE INVESTIGATION OF AIRCRAFT ENGINE IMPELLERS**

K. ANTROPIUS (Ceske Vysoke Uceni Technicke, Prague, Czechoslovakia) and A. PASLEROVA (Vyzkumny a Zkusebni Letecky Ustau, Prague, Czechoslovakia) IN: Optical methods in dynamics of fluids and solids; Proceedings of the International Symposium, Liblice, Czechoslovakia, September 17-21, 1984 . Berlin and New York, Springer-Verlag, 1985, p. 35-41. refs

The resonant mode shapes of several radial-bladed stationary impellers and of two radial blades removed from the impeller body were investigated by CW-laser holographic interferometry. The greatest attention was paid to the frequency range from 10 to 15 kHz. A retroreflective white paint was used for coating the impeller surface, which helped to enhance the fringes in real-time/time-average visualization, and to shorten the exposure times in hologram recording. Impeller excitation was performed by a set of 10 piezoelectric transducers. In cases with higher-amplitude vibrations a method of additional static exposure was applied. Author

### SOLUTION OF PROBLEMS OF CONJUGATE HEAT TRANSFER DURING FLOW PAST BODIES OF DIFFERENT SHAPE [RESHENIE ZADACH SOPRIAZHENNOGO TEPLOOBMENA PRI OBTEKANII TEL RAZLICHNOI FORMY]

V. I. ZINCHENKO and E. N. PUTIATINA PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), Mar.-Apr. 1986, p. 85-93. In Russian. refs

An analysis is made of unsteady heat transfer during the supersonic flow of an ideal gas past axisymmetric bodies of resolution of different shape for Reynolds numbers corresponding to different flow regimes in the boundary layer. Numerical and analytical solutions for heat flux from a nonisothermal surface are compared for laminar flow regimes. It is shown that, in the laminar case, the heat flux to the body has a structure connected with the preliminary development history of the thermal and dynamic boundary layer, and with the value of the local derivative of surface temperature. For certain surface shapes, the use of accepted formulas for the heat transfer coefficient leads to significant errors in the separable formulation of the problem of determining the temperature field in the body. ### CALCULATION OF THE BALANCING EFFICIENCY OF FLEXIBLE ROTORS OF COMPRESSOR UNITS ON LOW-CYCLE BALANCING MACHINES [RASCHET EFFEKTIVNOSTI URAVNOVESHIVANIIA GIBKIKH ROTOROV KOMPRESSORNYKH AGREGATOV NA NIZKOCHASTOTNYKH BALANSIROVOCHNYKH STANKAKH]

A. I. GLEIZER and V. A. BULYCHEV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 1, 1986, p. 15-19. In Russian.

A method for calculating the efficiency of the low-cycle balancing of flexible rotors on acceleration-type balancing machines is proposed. The method includes a probabilistic estimation of the residual unbalance and a calculation of the limiting level of support vibrations or rotor deflections. The data obtained are compared with norms of residual vibrations permitted under low-cycle balancing. B.J.

### THERMAL STABILITY OF GAS TURBINE BLADES WITH PROTECTIVE COATINGS [TERMOSTOIKOST' LOPATOK GAZOVYKH TURBIN S ZASHCHITNYMI POKRYTIIAMI]

A. P. VOLOSHCHENKO, ED., G. N. TRETIACHENKO, ED., L. B. GETSOV, ED., B. M. ZINCHENKO, ED., I. S. MALASHENKO, ED. (Leningradskoe Ob'edinenie Proletarskii Zavod, Leningrad, USSR; AN USSR, Institut Elektrosvarki and Institut Problem Prochnosti, Kiev, Ukrainian SSR) et al. Problemy Prochnosti (ISSN 0556-171X), May 1986, p. 45-50. In Russian.

The thermal stability of turbine blade models with fused slurry and electron-beam coatings has been investigated in gas flow under conditions of thermal cycling, static loading, and sea water exposure. It is shown that blades of various high-temperature alloys (e.g., EP22VD, ZhS6U, EP539VD, and EP539LM) can be effectively protected against sulfide corrosion by using electron-beam coatings of the system Co-Cr-Al-Y. In order to achieve high thermal fatigue strength, tight control of the heating during coating deposition and heat treatment of the blades are essential. V.L.

### X-RAY FLUORESCENCE ANALYSIS OF WEAR METALS IN USED LUBRICATING OILS

W. E. MADDOX (Murray State University, KY) and W. C. KELLIHER (NASA, Langley Research Center, Hampton, VA) IN: Advances in X-ray analysis. Volume 29. New York, Plenum Publishing Corp., 1986, p. 497-502. refs
(Contract NCCC1-92)

Used oils from several aircraft at NASA's Langley Research Center were analyzed over a three year period using X-ray fluorescence (XRF) and atomic emission spectrometry. The results of both analyses are presented and comparisons are made. Fe and Cu data for oil from four internal combustion engines are provided and XRF and atomic emission spectrometry measurements were found to be in perfect agreement. However, distributions were found in the case of oil from a jet aircraft engine whereby the latter method gave values for total iron concentration in the oil and did not distinguish between suspended particles and oil additives. XRF does not have these particle-size limitations; moreover, it is a faster process. It is concluded that XRF is the preferred method in the construction of a man-portable oil wear analysis instrument. K.K.

### THE FLOWFIELD OF A SIDE-DUMP COMBUSTOR

N. NOSSEIR and S. BEHAR *In* Johns Hopkins Univ. The 22nd JANNAF Combustion Meeting, Vol. 1 p 289-294 Oct. 1985
(Contract N0014-84-K-0373)
Avail: CPIA, Laurel, Md. 20707 HC $70.00 CSCL 21B

Flow visualization is used to study the characteristics of the flowfield of a side-dump combustor. A two-dimensional combustor simulator, with water as the working fluid, is used in this experiment. In this configuration, two jets are introduced into the combustor through rectangular ports in the combustor's sides. The two jets impinge on each other at the plane of symmetry of the combustor. Counter-rotating vortex-pairs are generated near this plane. The axes of the vortices are parallel to the plane of symmetry of the combustor. The strength of the vortices changes periodically as they stretch along the downstream direction. The effects of changing the combustor dimensions on the generation of these vortices are investigated. Author

### FUTURE AERONAUTICAL COMMUNICATION SYSTEM (FACS): REPORT

H. J. HOF Jun. 1985 102 p In DUTCH
(ESA-86-96959) Avail: NTIS HC A06/MF A01

The feasibility of a FACS design, particularly with regard to application possibilities of satellites, was investigated. It was assumed that communication between airborne stations and air traffic control centers is exclusively possible via satellites using mainly voice communication (possibly completed by data

communication). It is concluded that integration possibilities of satellites are mainly limited by the airborne antenna chosen. As a solution, phase steered microstrip antenna arrays are presented. However, the use of these antennas is limited to large (long-distance) aircraft. For operational feasibility, it is concluded that communication should take place in the high frequency band.

**THE IMPACT OF VERY HIGH PERFORMANCE INTEGRATED CIRCUITS ON RADAR, GUIDANCE AND AVIONICS SYSTEMS**
Loughton, England Aug. 1985 396 p In ENGLISH and FRENCH Symposium held in Lisbon, Portugal, 20-25 May 1985
(AGARD-CP-380; ISBN-92-835-0379-1) Avail: NTIS HC A17/MF A01

Advances with silicon integrated circuit technology have demonstrated the feasibility of very large scale integration with gate densities of 10 to the 5th power/sq cm and with functional throughput rates in excess of 10 to the 12th power gate Hz/sq cm. These advances offer the prospect of compact, low power consumption, high throughput processors in a wide variety of roles throughout military electronic systems. This symposium aimed to involve integrated circuit experts who reviewed ththeir current and projected capabilities, circuit and subsystems designers who are exploiting the technology in implementing sophisted processing and data manipulation techniques and who reported on their progress, and system designers who described applications addressed by the advancing technology.

**THE FUTURE OF BIPOLAR TECHNOLOGY FOR AVIONICS**
B. DUNBRIDGE *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 10 p Aug. 1985
Avail: NTIS HC A17/MF A01

In the past 25 years, silicon integrated circuit (IC) device technology has been heavily utilized in military and avionics systems due to primary advantages in availability, versatility, environmental ruggedness/reliability, and speed/frequency performance. Silicon n-channel metal oxide semiconductor (NMOS) technology has also rapidly developed and has been dominant for commercial applications due to its previous advantages of cost and density in modest environments, especially for standard memory and microprocessor functions. Complementary metal oxide semiconductor (CMOS) LSI/VLSI has more recently rapidly emerged as the dominant MOS device technology of the the future. The long held speed performance advantage of silicon bipolar ICS is also being challenged by the superior switching speed of GaAs field-effect transistor (FET) ICs. The question arises as to the future competitiveness and role of silicon bipolar. The question is further examined in this paper, especially for future avionics systems applications having heavy realtime digital signal processing requirements.

**THE APPLICATION OF HIGH-PERFORMANCE INTEGRATED CIRCUITS FOR AIRPORT FIRE CONTROL RADARS [INTERET DES CIRCUITS INTEGRES DE HAUTES PERFORMANCES POUR LES RADARS AEROPORTES DE CONDUITS DE TIR]**
J. C. MARCHAIS *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 4 p Aug. 1985 In FRENCH; ENGLISH summary
Avail: NTIS HC A17/MF A01

The number of functional modes needed for airport fire control radars, together with the need for high-performance characteristics, indicates that high-performance integrated circuits will have significant applications in such radar. It is shown that multi-function and multi-mode radars which combine air-to-air combat, air-to-ground and air-to-sea modes will comprise the basis for the next generation of fire control radars. Other applications for such radars are shown to include anti-collision, air navigation and air-to-air pursuit modes.

**POSSIBLE IMPACTS OF VHSIC ON MIL-STD-1553B DATA TRANSMISSION MANAGEMENT**
L. BERARDI and M. MERLANO *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 12 p Aug. 1985
Avail: NTIS HC A17/MF A01

High performance integrated circuit technologies allow for dramatic improvement in speed and reduction in size of the integrated circuits. This fact results in the possibility to pack in a denser way the computing and decision making functions of the avionics systems. Nevertheless it is still necessary to connect together the various sytem components, spread through the airframe, by means of an interfunction data transmission system. For these reasons the application of the new technologies to a MIL-STD-1553B data transmission system is considered. In particular the data management task allocated to the Bus Controller is described in four increasing levels of complexity, ranging from the minimum requirement to an 'expert' function including an high degree of configurability. The performance obtainable by implementing the functions in the current or new technologies, and with two different architectural solutions, are measured or estimated. The comparison among the obtained results shows that the new technologies not only improve the performances of the data transmission system, but also allow to include an higher degree of intelligence in the function, extending in this way the application of MIL-STD-1553B to future advanced avionic systems.

**THE IMPACT OF VHPIC ON AVIONIC SYSTEM ARCHITECTURE, PACKAGING AND MAINTAINABILITY**
L. T. J. SALMON and D. E. OLDFIELD *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 5 p Aug. 1985
Avail: NTIS HC A17/MF A01

The advent of high performance integrated circuit technology will have a far reaching effect on avionic systems. Currently, the impact is being mainly felt at a high bandwidth, signal processing level where the benefits are self-evident, however, unless the effect of the technology is considered across the whole of the avionic system then there is little doubt that much of the improved mission effectiveness promised by the new, high bandwidth systems will not accrue. A wider, system level approach is therefore needed which not only encompasses the technical aspects of individual sensors but also considers the remainder of the airborne data processing system and more traditional topics such as maintainability, packaging and architecture. This paper highlights some of the areas in which very high performance integrated circuits (VHPIC) could have a major impact on avionics systems and indicates some of the factors that will need to be considered during the design of future systems.

**THE IMPACT OF VERY HIGH PERFORMANCE INTEGRATED CIRCUITS ON AVIONICS SYSTEM READINESS**
G. STRULL *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 2 p Aug. 1985
Avail: NTIS HC A17/MF A01

Very high performance integrated circuits (VHPIC) represent more than an integrated circuit technology advance- VHPIC really represents a new systems/technology culture. With a philosophy of top-down design and bottom-up build, a vehicle is provided to avoid rapid obsolescence so prevalent in the fast moving integrated circuit industry. However, to successfully and effectively design advanced systems in this manner, a design methodology is required that adequately addresses the challenge. Since everything from chip definition through application analysis is interactive with everything else, the challenge is to adequately keep track of all the perimeters and their relationship. The methodology by which design and analysis are accomplished is discussed. The starting point is the systems architecture and its application software. From the architecture and application software the partitioning of the system into appropriate modules can be derived. From this an idea of the integrated circuits needed can be determined. The elements of system readiness are described. They are design, implementation, insertion, maintenance, and (Preplanned Product Improvement). Author

**THE IMPACT OF ARTIFICIAL INTELLIGENCE ON AIRBORNE MARITIME RECONNAISSANCE**
J. SHEPARD and R. J. SCOTT-WILSON *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 14 p Aug. 1985
Avail: NTIS HC A17/MF A01

Some of the problems arising out of the introduction of VHPIC to the sensor and data processing systems of Maritime Reconnaissance aircraft are susceptible to solution by conventional computing techniques within mission time constraints. Some may be more susceptible to the use of artificial intelligence techniques. This paper identifies those aspects of artificial intelligence relevant to the Airborne Maritime Reconnaissance task and the areas of the current task where artificial intelligence can be usefully applied. It reviews the current state of the art in the relevant aspects of artificial intelligence and indicates how they might be employed in the near, medium and long term. It indicates some future applications and concludes that, artificial intelligence will play an important role in the future Maritime Reconnaissance aircraft. Author

**FEASIBILITY STUDY OF OPTICAL BOUNDARY LAYER TRANSITION DETECTION METHOD Final Report, 22 Feb. 1983 - 15 Nov. 1985**
M. AZZAZY, D. MODARRESS, and J. D. TROLINGER Jun. 1986 179 p
(Contract NAS1-17293)
(NASA-CR-178109; NAS 1.26:178109; SLD-85-2285-47F) Avail: NTIS HC A09/MF A01 CSCL 20D

A high sensitivity differential interferometer was developed to locate the region where the boundary layer flow undergoes transition from laminar to turbulent. Two laboratory experimental configurations were used to evaluate the performance of the interferometer: open shear layer, and low speed wind tunnel turbulent spot configuration. In each experiment, small temperature fluctuations were introduced as the signal source. Simultaneous cold wire measurements were compared with the interferometer data. The comparison shows that the interferometer is sensitive to very weak phase variations in the order of 0.001 the laser wavelength. An attempt to detect boundary layer transition over a flat plate at NASA-Langley Unitary Supersonic Wind Tunnel using the interferometer system was performed. The phase variations during boundary layer transition in the supersonic wind tunnel were beyond the minimum signal-to-noise level of the instrument. Author

**FEASIBILITY OF GENERATING AN ARTIFICIAL BURST IN A TURBULENT BOUNDARY LAYER**
M. GAD-EL-HAK Washington NASA Aug. 1986 53 p
(Contract NAS1-17951)
(NASA-CR-4003; NAS 1.26:4003; REPT-332) Avail: NTIS HC A04/MF A01 CSCL 20D

Artificial bursts were generated in laminar and turbulent boundary layers. The burst-like events were produced by withdrawing near-wall fluid from two minute holes separated in the spanwise direction or by pitching a miniature delta wing that was flush-mounted to the wall. Either of these actions generated streamwise vorticity and a low-speed streak that resembled a naturally occurring one. The resulting sequence of events occurred at a given location and at controlled times, allowing detailed examination and comparison with natural, random bursts by means of flow visualization and fast-response probe measurement techniques. **FEASIBILITY OF A NUCLEAR GAUGE FOR FUEL QUANTITY MEASUREMENT ABOARD AIRCRAFT**
J. J. SIGNH, G. H. MALL (Computer Sciences Corp., Hampton, Va.), D. R. SPRINKLE, and H. CHEGINI (Old Dominion Univ., Norfolk, Va.) Aug. 1986 25 p
(NASA-TM-87706; L-16132; NAS 1.15:87706) Avail: NTIS HC A02/MF A01 CSCL 14B

Capacitance fuel gauges have served as the basis for fuel quantity indicating systems in aircraft for several decades. However, there have been persistent reports by the airlines that these gauges often give faulty indications due to microbial growth and other contaminants in the fuel tanks. This report describes the results of a feasibility study of using gamma ray attenuation as the basis for measuring fuel quantity in the tanks. Studies with a weak Am-241 59.5-keV radiation source indicate that it is possible to continuously monitor the fuel quantity in the tanks to an accuracy of better than 1 percent. These measurements also indicate that there are easily measurable differences in the physical properties and resultant attenuation characteristics of JP-4, JP-5, and Jet A fuels. The experimental results, along with a suggested source-detector geometrical configuration are described. Author

**IMPROVEMENT IN THE QUALITY OF FLOW VISUALIZATION IN THE LANGLEY 0.3-METER TRANSONIC CRYOGENIC TUNNEL**
W. L. SNOW, A. W. BURNER, and W. K. GOAD 1986 24 p
(NASA-TM-87730; L-16108; NAS 1.15:87730) Avail: NTIS HC A02/MF A01 CSCL 14B

Optical diagnostic techniques have not been as successful in the 0.3-Meter Transonic Cryogenic Tunnel as in conventional wind tunnels. This paper describes a simple shadowgraph experiment which allowed evacuation of the optical paths outside the test section. The results show that refractive index variations induced by temperature gradients outside the test section account for most of the image degradation. Earlier reports had erroneously attributed this degradation to inhomogeneities in the test section. Evacuation of the paths leading to and from the test section significantly improves the quality of flow visualization. Author

**NASTRAN SUPPLEMENTAL DOCUMENTATION FOR MODAL FORCED VIBRATION ANALYSIS OF AERODYNAMICALLY EXCITED TURBOSYSTEMS**
V. ELCHURI and P. R. PAMIDI (RPK Corp., Columbia, Md.) Jul. 1985 133 p
(Contract NAS3-24387)
(NASA-CR-174967; NAS 1.26:174967) Avail: NTIS HC A07/MF A01 CSCL 20K

This report is a supplemental NASTRAN document for a new capability to determine the vibratory response of turbosystems subjected to aerodynamic excitation. Supplements to NASTRAN Theoretical, User's, Programmer's, and Demonstration Manuals are included. Turbosystems such as advanced turbopropellers with highly swept blades, and axial-flow compressors and turbines can be analyzed using this capability, which has been developed and implemented in the April 1984 release of the general purpose finite element program NASTRAN. The dynamic response problem is addressed in terms of the normal modal coordinates of these tuned rotating cyclic structures. Both rigid and flexible hubs/disks are considered. Coriolis and centripetal accelerations, as well as differential stiffness effects are included. Generally non-uniform steady inflow fields and uniform flow fields arbitrarily inclined at small angles with respect to the axis of rotation of the turbosystem are considered as the sources of aerodynamic excitation. The spatial non-uniformities are considered to be small deviations from a principally uniform inflow. Subsonic and supersonic relative inflows are addressed, with provision for linearly interpolating transonic airloads. Author

**VHF-FM COMMUNICATIONS ANTENNAS FOR PROJECT SINCGARS (UH-1 TAIL WHIP ANTENNA EVALUATION)**

J. CARALYUS, J. MILLER, and F. CANSLER Feb. 1986 129 p

(AD-A165897; AVSCOM-TR-85-E-2) Avail: NTIS HC A07/MF A01 CSCL 17B

A full-scale study was conducted by the Naval Air Development Center, Warminster, Penn. (NADC), for the C3 Division of the U.S. Army Avionics Research and Development Activity (AVRADA), Fort Monmouth, N.J., to test and evaluate production prototype antenna systems that essentially met the requirement for SINCGARS operation when installed on an Army UH-1 helicopter. The results of these tests determined a suitable tail whip antenna to be used on the UH-1 to satisfy the SINCGARS requirement between 30 and 88 MHz. This technical report describes the results of tests conducted on antennas manufactured by three major Airborne Antenna manufacturers, each of whom attempted to provide an antenna system that would directly replace the standard Army CU-942B antenna, and satisfy the more stringent requirements of project SINCGARS. The information in this report provides, in part, the technical data for the production data package of an adequate VHF-FM Communications antenna for the UH-1 aircraft. GRA

N. J. MOURTOS Sep. 1984 51 p Previously announced as N85-25215

(Contract NCC2-149)

(NASA-CR-176908; NAS 1.26:176908; JIAA-TR-58) Avail: NTIS HC A04/MF A01 CSCL 20D

An attempt was made to model the so called leading edge vortex which forms over the leading edge of delta wings at high angles of attack. A simplified model was considered, namely that of a two-dimensional, inviscid, incompressible steady flow around a flat plate at an angle of attack with a stationary vortex detached on top, as well as a sink to simulate the strong spanwise flow. The results appear to agree qualitatively with experiments. A comparison was also made between the lift and the drag of this model and the corresponding results for two classical solutions: (1) that of totally attached flow over the plate with the Kutta condition satisfied at the trailing edge only: and (2) the Helmholtz solution of totally separated flow over the plate. M.G.

**SHOCK-WAVE BOUNDARY LAYER INTERACTIONS**

J. DELERY (Office National d'Etudes et de Recherches Aeronautiques, Paris, France), J. G. MARVIN (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.), and E. RESHOTKO (Case Western Reserve Univ., Cleveland, Ohio) Feb. 1986 223 p

(AGARD-AG-280; ISBN-92-835-1519-6) Avail: NTIS HC A10/MF A01

Presented is a comprehensive, up-to-date review of the shock-wave boundary-layer interaction problem. A detailed physical description of the phenomena for transonic and supersonic speed regimes is given based on experimental observations, correlations, and theoretical concepts. Approaches for solving the problem are then reviewed in depth. Specifically, these include: global methods developed to predict sudden changes in boundary-layer properties; integral or finite-difference methods developed to predict the continuous evolution of a boundary-layer encountering a pressure field induced by a shock wave; coupling methods to predict entire flow fields; analytical methods such as multi-deck techniques; and finite-difference methods for solving the time-dependent Reynolds-averaged Navier-Stokes equations used to predict the development of entire flow fields. Examples are presented to illustrate the status of the various methods and some discussion is devoted to delineating their advantages and shortcomings.

(Contract DTRS57-80-C-00190)

(FAA/CT-85-32) Avail: NTIS HC A06/MF A01

The procedures of analysis and dynamometer testing that were used to develop data and supporting technology for improving the maintenance and continued airworthiness of civil aircraft tires are described. As related to the inspection, retread and repair of aircraft tires under Advisory Circular AC 145-41, improved criteria which characterize typical tire operating environments and operating scenarios (associated with long range, medium range, and short haul transport airplanes) are defined. Based upon these criteria and scenarios which include tire loading, temperature, and roll distances, means to assess tire fatigue life were developed. Results of this effort may be used for the identification of in-service acceptance criteria and prescribed retread limits. Author

**AIRCRAFT AND BEARING TRIBOLOGICAL SYSTEMS**

Loughton, England Feb. 1986 232 p Meeting held in San Antonio, Tex., 22-26 Apr. 1985

(AGARD-CP-394; ISBN-92-835-1509-9) Avail: NTIS HC A11/MF A01

Advances in aircraft gear and bearing tribology are discussed. Future trends and problems, gear and bearing materials, and lubricants are discussed.

**N86-29238#** Schaefer (Georg) and Co., Schweinfurt (West Germany).

**EFFECTS OF UNFAVORABLE ENVIRONMENTAL CONDITIONS ON THE SERVICE LIFE OF JET ENGINE AND HELICOPTER BEARINGS**

H. K. LOROESCH *In* AGARD Aircraft and Bearing Tribological Systems 9 p Feb. 1986

Avail: NTIS HC A11/MF A01

Aircraft bearings normally operate at high speeds and have to meet demanding reliability requirements. If conventional guidelines for their design are used, the resultant stresses are low. The stresses are particularly low if compared to those customarily applied in testing rolling fatigue. Potential fatigue life, the influence of plastic deformation in the raceways, the influence of surface damage and loading, service life under favorable lubricating conditions, achievable fatigue life at loads above the endurance limit, and the influence of contamination are discussed. **AERO-ENGINE GEARS: MANUFACTURING CRACKS AND THEIR EFFECT ON OPERATION**

J. SPECHT *In* AGARD Aircraft and Bearing Tribological Systems 10 p Feb. 1986

Avail: NTIS HC A11/MF A01

The effect of cracks in gear splines is discussed. After black-oxidising of case-hardened gears, stress corrosion cracking may occur. This was determined from damage analysis of cracked gears of flight engines and from sample testing. Besides design measures to reduce operational stresses, corrective action may be in the form of modified manufacturing procedures and improved crack inspection. Author

**TRIBOLOGY IN AIRCRAFT SYSTEMS: BASIC PRINCIPLES AND APPLICATIONS**

E. JANTZEN and V. BUCK *In* AGARD Aircraft and Bearing Tribological Systems 13 p Feb. 1986

Avail: NTIS HC A11/MF A01

The historical origin of the name tribology is outlined. The trends for the next two decades are reviewed: reduction of fuel consumption, improvement of the ratio of specific output to weight, reduction of maintenance, and further improvement of safety. Then the consequences from these trends are outlined with respect to research in tribology. The current status of research is sketched and some unsolved problems are discussed: interaction of material/lubricant in areas with mixed friction (reaction layers); interaction of material/lubricant in the hydrodynamic region; friction and wear of synthetic bearings with and without lubrication; friction, wear and service time if solid lubricants are used; and topographical features of surfaces. Many government sponsored research to gain the wide spread of basic knowledge necessary for new and better solutions. Author

**DESIGN AND CALCULATION OF HIGH SPEED ENGINE BEARINGS**

H. J. KOEBER *In* AGARD Aircraft and Bearing Tribological Systems 12 p Feb. 1986

Avail: NTIS HCA11/MF A01

New aspects in design and calculation of high speed ball and roller bearings are discussed in as much as they affect bearing performance in the speed range of DxN = 3.0 x 1 million min-1 and beyond. For roller bearings the guide flange to roller end configuration as well as roller excursion within the cage pocket are linked to the phenomena of skewing and skidding. The need for under-race-lubrication in small diameter engine bearings is derived from this and a special solution (integral scoop) is shown along with related performance data. The influence of incorporating state of the art rolling elements made of silicon nitride on the design and calculation of high speed ball and roller bearings is shown taking into account hardness, density, Young's modulus and the Poisson ratio. Increase speeds coupled with additional design features being incorporated (such as lubrication holes, grooves, slots) require that inner rings of improved fracture toughness be developed with existing materials of known properties thus supplementing the material development activities already under way. **MULTIFUNCTIONAL REQUIREMENTS FOR A GEARBOX SECONDARY POWER SYSTEM IN A MODERN FIGHTER AIRCRAFT AND ITS COMPONENTS AND INTERFACE REQUIREMENTS**

M. PUCHER *In* AGARD Aircraft and Bearing Tribological Systems 14 p Feb. 1986

Avail: NTIS HC A11/MF A01

The basic task of the gearbox in a Secondary Power System (SPS) of an aircraft is to provide and distribute mechanical energy from the Auxiliary Power Unit (APU) or from the Main Engine (ME) to the accessories, e.g., generators, hydraulic pumps and fuel pumps. The complexity as well as the functional facilities increase by incorporating further functional requirements such as main engine start, cross drive operation between redundant systems with the associated control devices, including oil supply to the accessories into the gearbox oil system. The Tornado-SPS is one of the most modern systems flying today. The system shows a high reliability although the aircraft has been in service for only a few years. The experience gained with major components like gearbox housing, gearing, freewheel clutches, dry friction cluthes and components of the oil system is reported. Some aspects from this experience are given for the design of gearboxes for future secondary power systems. Author

**EXPERIMENTAL CLASSICAL FLUTTER REESULTS OF A COMPOSITE ADVANCED TURBOPROP MODEL**

O. MEHMED and K. R. V. KAZA Jul. 1986 18 p Presented at the Bisplinghoff Memorial Symposium on Recent Trends in Aeroelasticity, Structures and Structural Dynamics, Gainesville, Fla., 6-7 Feb., 1986; sponsored by Fla. Univ.

(NASA-TM-88792; E-3127; NAS 1.15:88792) Avail: NTIS HC A02/MF A01 CSCL 20K

Experimental results are presented that show the effects of blade pitch angle and number of blades on classical flutter of a composite advanced turboprop (propfan) model. An increase in the number of blades on the rotor or the blade pitch angle is destablizing which shows an aerodynamic coupling or cascade effect between blades. The flutter came in suddenly and all blades vibrated at the same frequency but at different amplitudes and with a common predominant phase angle between consecutive blades. This further indicates aerodynamic coupling between blades. The flutter frequency was between the first two blade normal modes, signifying an aerodynamic coupling between the normal modes. Flutter was observed at all blade pitch angles from small to large angles-of-attack of the blades. A strong blade response occurred, for four blades at the two-per-revolution (2P) frequency, when the rotor speed was near the crossing of the flutter mode frequency and the 2P order line. This is because the damping is low near the flutter condition and the interblade phase angle of the flutter mode and the 2P response are the same. Author

(ONERA-RT-7/3542-RY-041-R; ESA-86-97202) Avail: NTIS HC A02/MF A01

The limit conditions are used to modify the classical solution to satisfy the three dimensional conditions, in order to study a complex stress distribution that could result in composite layer delaminating. The general equations of a zero order model are presented. They reveal the interface complex conditions, which are theoretically simple to solve. The practical solutions are not simple, and the particular cases for which a comparison with analytical solutions is possible, are discussed. ESA

**THE CALCULATION OF THE ENTROPY DISTRIBUTION ALONG CLOUD TRAVERSES USING AIRCRAFT MEASUREMENTS**

TH. HAUF and J. WEIDNER (DFVLR, Institut fuer Physik der Atmosphaere, Oberpfaffenhofen, West Germany) Meteorologische Rundschau (ISSN 0026-1211), vol. 39, April 1986, p. 33-36. refs

The entropy distribution along horizontal cloud traverses is calculated using aircraft data of high spatial resolution. For the first time, absolute values of entropy inside and outside of clouds are presented. The entropy trace is nearly identical with the humidity trace. Strong fluctuations of entropy are found at the cloud edges. Temperature fluctuations are negatively correlated with the humidity fluctuations and tend to smooth the entropy distribution outside the clouds. The variations in the fields of liquid water content and pressure have negligible effect on the entropy. Results are discussed using the entropy state function. Author

**TAMING THE KILLER WIND SHEAR**

E. J. LERNER Aerospace America (ISSN 0740-722X), vol. 24, May 1986, p. 38-40, 42.

Technical difficulties and bureaucratic hurdles are considered that must be overcome before timely wind shear warnings are routinely available for pilots. The circumstances of the downdraft/microburst wind shear conditions that caused the August 1985 crash of an L-1011 at Dallas/Fort Worth are examined. That crash could have been averted with a timely warning, but the existing system could only provide an alert 1-2 minutes too late. The CLAWS (classify, locate, and avoid wind shear) system - using a single Doppler radar and a beefed up system of anemometers, was a demonstration system developed by the FAA, but it was terminated for budgetary reasons. Lincoln Labs is working on a system with advanced features: ground clutter suppression, automated recognition of microburst and warning issuance. Other organizations working on the problem include NOAA, the Air Force, Sperry, and Raytheon. Real time prediction is still a problem. Improved wind shear safety over the short term depends on Doppler terminal radars and it remains to be seen whether recent crashes will pry from Congress and the Office of Management and Budget the half-billion dollars needed to get them on the air. D.H.

**A SIMPLIFIED MODEL OF THE TURBULENT MICROBURST**
L. ROBERTS and T. WAN Mar. 1985 27 p
(Contract NCC2-270)
(NASA-CR-177108; NAS 1.26:177108; SU-JIAA-TR-59) Avail: NTIS HC A03/MF A01 CSCL 04B

A simple model was developed to describe the low altitude shear associated with a microburst (or small downburst) in the atmosphere. Such microbursts are thought to be the cause of convective radial flows near the ground which represent potentially hazardous conditions to aircraft during approach and landing. Closed form solutions are presented for the equations of mass, momentum, and thermal energy to give the spreading rate of the microburst and the velocity and temperature decay due to turbulence. An analysis of the impact of the microburst and its radial spreading over the ground is given and illustrated examples are provided. The solution for the downward and outward wind velocities are given in terms of simple dimensionless algebraic parameters which can be computed readily in realtime during a piloted simulation of an aircraft flying through a microburst. **DISPLACEMENT THRESHOLDS IN CENTRAL AND PERIPHERAL VISION DURING TRACKING**
R. F. HAINES (NASA, Ames Research Center, Moffett Field, CA) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 57, June 1986, p. 548-554. refs

The effects of stimulus duration and angular velocity on a subject's judgment of displacement threshold are examined. Twenty-six male subjects between 17-45 years with uncorrected 20:20 distance acuity and normal color perception and stereopsis studied a series of forced choice, paired comparison trials in which a long, thin, collimated horizontally oriented line moved downward through 12 angles ranging from 0.6-60 arcmin and judged which stimulus moved in each pair. The displacements were produced by 0.25, 0.5, 1, 2, and 4 sec stimulus duration and 2.5, 5, 10, and 15 deg/sec angular rates. Stimulus velocity, stimulus duration, mean threshold displacement, and mean confidence results are analyzed. It is observed that displacement judgment accuracy is increased with increasing stimulus duration. The data are compared with the results of Johnson and Leibowitz (1976) and Johnson and Scobey (1982), and good correlation with the Johnson and Leibowitz data is detected. The data reveal that threshold is based on a constant stimulus velocity over this range of durations and velocities. The data are applicable to the study of the final approach to landing of medium and large commercial jet aircraft. I.F.

**COMPUTER AIDED CONTROL SYSTEM DESIGN USING A MULTIOBJECTIVE OPTIMIZATION APPROACH**
P. J. FLEMING (North Wales, University College, Bangor, Wales) and A. P. PASHKEVICH (Minskii Radiotekhnicheskii Institut, Minsk, Belorussian SSR) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 1 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 174-179. refs

Multiobjective optimization attempts to simultaneously optimize several objectives with respect to the free controller parameters. An evaluation is presently made of multiobjective optimization strategies, with attention to the goal-attainment method; this is applied to three different examples in order to demonstrate the technique: (1) a case highlighting the value of multiobjective optimization in the generation of tradeoff surfaces; (2) a multiregime linear quadratic regulator problem; and (3) the design of a cascade compensator, subject to standard control specifications. Plans for the development of the multiobjective optimization approach as a computer-aided control system design tool are discussed. O.C.

**A86-40762**
**THE DESIGN AND IMPLEMENTATION OF MULTIVARIABLE VARIABLE STRUCTURE CONTROL SYSTEMS**
C. M. DORLING and A. S. I. ZINOBER (Sheffield, University, England) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 1 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 264-269. refs

The design of the sliding mode in a nominally linear variable structure control system (VSCS) may be completed independently of the form of the actual control functions selected. After defining the nominally linear time-varying and uncertain system that is to be controlled, some of the options available in the design of a stable sliding mode are considered; a canonical form is employed for the design of the hyperplane matrix and the control structure. Attention is given to the eigenstructure assignment method for the design of the sliding mode, and the design of the controller that ensures correct operation in the two stages of the VSCS is outlined. O.C.

### AN EXPERT SYSTEM FOR CONTROL SYSTEM DESIGN

T. L. TRANKLE and L. Z. MARKOSIAN (Systems Control Technology, Inc., Palo Alto, CA) IN: Control 85; Proceedings of the International Conference, Cambridge, England, July 9-11, 1985. Volume 2 . London/New York, Institution of Electrical Engineers/IEE Inspec, 1985, p. 495-499. Research supported by the McDonnell Aircraft Corp. refs

Work in progress to develop knowledge-based expert systems to supervise adaptive control systems in real time is reported. The overall structure of an expert adaptive controller is outlined, and a detailed description is given of one of its components: the feedback control system designer. This designer uses a planning expert system to supervise the application of computer-aided control system design (CACSD) algorithms. The design of an aircraft feedback control system is mentioned as an example. B.J.

**A86-41934**

### TWO APPROACHES TO HYPERPLANE DESIGN IN MULTIVARIABLE VARIABLE STRUCTURE CONTROL SYSTEMS

C. M. DORLING (Sheffield, University, England) and A. S. I. ZINOBER (Topexpress, Ltd., Cambridge, England) International Journal of Control (ISSN 0020-7179), vol. 44, July 1986, p. 65-82. refs

The design of a stable sliding mode in a variable structure control system is considered in detail. A certain canonical form for the nominal linear system is described, with particular reference to a numerical implementation. Two methods of determining the subspace within which ideal sliding motion occurs are presented, these methods being based on quadratic minimization and eigenstructure assignment. A control structure ensuring the attainment of the sliding mode is summarized, along with a practical method of removing the chatter motion associated with variable structure systems. An example illustrating the methods described is included. Author

**A86-42860**

### ROBUST SIMPLIFIED ADAPTIVE CONTROL FOR A CLASS OF MULTIVARIABLE CONTINUOUS-TIME SYSTEMS

I. BAR-KANA (Rafael Armament Development Authority, Haifa, Israel) and H. KAUFMAN (Rensselaer Polytechnic Institute, Troy, NY) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 141-146. refs

This paper presents a simple and robust adaptive control algorithm for a class of multivariable continuous-time linear systems. Boundedness of all values involved in the adaptation process is guaranteed in the presence of parasitic disturbances and dynamics provided that the controlled plant is stabilizable via unknown static output feedback. The usual need of prior knowledge about the order of the plant and about the pole-excess is also eliminated. Although these techniques can be generalized and their applicability can be extended to systems that need dynamic feedback in order to achieve stability, the present algorithm has its own importance, due to its extreme simplicity of implementation that may facilitate application of adaptive control in realistic complex control systems with unknown parameters. Author

**A86-42871**

### NEW APPLICATIONS OF MU TO REAL-PARAMETER VARIATION PROBLEMS

B. G. MORTON (Honeywell Systems and Research Center, Minneapolis, MN) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 233-238.

The structured singular value (SSV) has been used in recent studies of the robust stability of feedback systems subject to real-parameter variations. In this paper, the results obtained when some new upper-bounds on the SSV for real-parameters were used in two studies of flight control systems are summarized. The perturbation structure for higher rank perturbations is discussed and the issue of lower-bounds for the SSV in the real-parameter problem is considered. A new theoretical result relevant to lower-bounds in a special case is given. Author

### A DIFFERENTIAL DYNAMIC PROGRAMMING METHOD WITH AN ABRUPT PENALTY INTEGRAND FOR SOLVING TOLERANCE PROBLEMS

B. JARMARK (SAAB-Scania AB, Linkoping, Sweden) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 287-289.

A nonlinear optimal control problem is considered in respect to a new class of performance index. The problem is to control an output function to be inside a prescribed tolerance zone. When inside the zone, this will result in a favorable cost contribution. When outside there will be no contribution. The numerical optimization algorithm used is a modified differential dynamic programming method. The method is expanded to this class of cost functionals. An example illustrates the difference in using the new cost functional and two other commonly used cost functionals. Author

**A86-42899**

### A COVARIANCE CONTROL THEORY

A. F. HOTZ and R. E. SKELTON (Purdue University, West Lafayette, IN) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 552-557. refs

A theory is presented for the design of linear feedback controllers in order to arrive at a closed loop system that achieves a specified state covariance. After defining the necessary and sufficient conditions for the existence of constant linear feedback controllers that assign a specified state covariance to the closed loop system, the resulting set of feedback gain matrices are identified. It is shown that when existence is verified, the set of solutions is in general very large. Author

**A86-42912**

### EIGENSTRUCTURE ASSIGNMENT, EIGENSENSITIVITY, AND FLIGHT CONTROL DESIGN

K. M. SOBEL (Lockheed-California Co., Burbank) and E. Y. SHAPIRO (HR Textron, Inc., Valencia, CA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 1 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 658, 659.

A sensitivity measure which describes changes in the damping of complex conjugate eigenvalues due to changes in the entries of the closed loop system matrix is introduced. An example is presented to illustrate the application of eigenstructure assignment with damping sensitivity reduction to the design of a flight control system. Author

**A86-42957**

### AN ANALYSIS OF A FOUR STATE MODEL FOR PURSUIT-EVASION GAMES

A. J. CALISE and X.-M. YU (Drexel University, Philadelphia, PA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 2 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 1119-1121. refs

An analysis is given for a four state model useful in medium range air-combat analysis. The problem is formulated as a differential game of degree, with capture time as the performance index. The model is representative of a three-dimensional pursuit-evasion game between two aircraft at medium to large ranges. A complete and exact characterization of the optimal paths and controls is given for arbitrary aerodynamic and propulsion models. Author

**A86-42996**

**INTEGRATED CONTROL - A DECENTRALIZED APPROACH**

A. EMAMI-NAEINI, R. P. ANEX, and S. M. ROCK (Systems Control Technology, Inc., Palo Alto, CA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 1836-1841. refs

(Contract F33615-82-C-2214)

A decentralized, robust, multivariable controls method is described for the functional integration of subsystems in large-scale systems characterized by dynamic coupling among subsystem elements. In an integrated environment, a decentralized control structure reduces the complexity of the control by distributing the control authority to local controllers. The method relies upon generation of a set of control design specifications for the subsystems. The subsystem designers are provided with design specifications that provide for the integration of control functions. If the subsystem designers can satisfy these specifications, successful integration of the subsystem controls is guaranteed. The specifications are in terms of stability and performance robustness constraints in the frequency domain. The results are applied to an integrated flight-propulsion control example. Author

**A86-43000*** Connecticut Univ., Storrs.

**DUAL CONTROL AND PREVENTION OF THE TURN-OFF PHENOMENON IN A CLASS OF MIMO SYSTEMS**

P. MOOKERJEE, Y. BAR-SHALOM, and J. A. MOLUSIS (Connecticut, University, Storrs) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 1888-1893. refs

(Contract NAG2-318; AF-AFOSR-84-0112)

A recently developed methodology of adaptive dual control based upon sensitivity functions is applied here to a multivariable input-output model. The plant has constant but unknown parameters. It represents a simplified linear version of the relationship between the vibration output and the higher harmonic control input for a helicopter. The cautious and the new dual controller are examined. In many instances, the cautious controller is seen to turn off. The new dual controller modifies the cautious control design by numerator and denominator correction terms which depend upon the sensitivity functions of the expected future cost and avoids the turn-off and burst phenomena. Monte Carlo simulations and statistical tests of significance indicate the superiority of the dual controller over the cautious and the heuristic certainity equivalence controllers. Author

**A86-43003**

**TRANSFER OF ALIGNMENT AND CALIBRATION OF MULTIPLE SENSORS IN FLEXIBLE SYSTEMS**

H. C. SALZWEDEL and K. M. KESSLER (Systems Control Technology, Inc., Palo Alto, CA) IN: Conference on Decision and Control, 24th, Fort Lauderdale, FL, December 11-13, 1985, Proceedings. Volume 3 . New York, Institute of Electrical and Electronics Engineers, Inc., 1985, p. 1932-1937. refs

A method for the transfer aligment and calibration of sensors in flexible systems is presented. Flexible systems are represented by high order differential equations and reduced in dimension by model order reduction techniques. Both disturbability of alignment errors by control and disturbance inputs are considered. The reduced order model is decomposed by non-symmetric Riccati decomposition into states that directly and indirectly affect alignment errors. A transfer alignment and calibration filter with control feedthrough is developed and demonstrated for the example of a large flexible aircraft model in turbulence. Author

**A86-43387**

**IDENTIFICATION OF FREQUENCY CHARACTERISTICS DURING BENCH TESTS [IDENTIFIKATSIIA CHASTOTNYKH KHARAKTERISTIK PRI STENDOVYKH ISPYTANIIAKH]**

I. KH. SADYKOV Aviatsionnaia Tekhnika (ISSN 0579-2975) no. 1, 1986, p. 47-52. In Russian.

Consideration is given to the identification of the frequency characteristics during bench tests of aircraft control systems using an analysis of experimental values of the input and output signals. It is shown that, for nonzero values of the initial conditions of the recorded signals, the determination of the frequency characteristics necessarily involves the identification of the parameters of a model of the test object. Algorithms for solving this problem are presented. B.J.

**MIL-DAP: ITS ARCHITECTURE AND ROLE AS A REAL TIME AIRBORNE DIGITAL SIGNAL PROCESSOR**

P. SIMPSON, J. B. G. ROBERTS, and B. C. MERRIFIELD *In* AGARD The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems 18 p Aug. 1985

Avail: NTIS HC A17/MF A01

Prototypes of a highly programmable digital processor, Mil-DAP, operating in excess of 300 MOPS and occupying less than a cubic foot will be available in 1985. Its architecture consisting of a large array of processing elements, controlled by a single control unit operating in a Single Instruction Muliple Data (SIMD) mode is described in some detail, including the provision of fast data input-output (up to 40 MBytes/sec), data buffering and programmable data reformation such as corner turning. Two programming languages exist; an assembler language for high efficiency and a higher level parallel form of FORTRAN. The ease of use of both these parallel languages is demonstrated with reference to simple examples. Mil-DAP's performance, size, weight and power consumption suit it well to the wide range of applications encountered in an avionics environment. For example, multimode, radar signal processing incorporating spectral analysis, constant false alarm rate processing and ambiguity resolution; speech recognition as in a voice driven cockpit; electronic support measures where very high speed association and recognition of received pulse information is needed; and reconnaissance image processing, are all potential real time applications. Benchmarks for these are given. Author

**NASA SUPERCOMPUTER SYSTEM TO BECOME AVAILABLE NATIONALLY**

D. J. RAHN and P. W. WALLTER (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.) 21 Jul. 1986 2 p

(NASA-NEWS-RELEASE-86-92; P86-10152) Avail: NASA Scientific and Technical Information Facility, P.O. Box 8752, B.W.I. Airport, Md. 21240 CSCL 09B

The most powerful supercomputer facility in the world, the Numerical Aerodynamic Simulation (NAS) system, will go on-line to scientists and engineers throughout the country on July 21, 1986. The NAS supercomputer complex will be linked with 27 remote locations across the country through a combination of high-speed terrestrail and satellite links. The Cray-2 supercomputer was installed as the main computational engine. The NAS CRAY-2 has a 256 million word memory (largest yet available) and can perform 250 million computations a second. The next generation superfast computer currently referred to as the HSP-2 (High Speed Processor-2) is expected to perform a billion computation a second. This will bring the NAS system closer to its near-term goal of having computer with a billion word memory and computational power of 4 billion calculations a second. The NAS system will be relocated to a new computational facility in late 1986 and will be fully operational in March 1987. B.G.

**THE USE OF MATHEMATICAL OPTIMIZATION TECHNIQUES BY THE DESIGNER**

R. F. VANDENDAM 25 Jan. 1985 46 p In DUTCH; ENGLISH summary Presented at Congress on Computer Applications in Production and Engineering (CAPE) Nederland '85, Amsterdam, Netherlands, May 1985
(NLR-MP-85005-U; B8578430; ESA-86-98975) Avail: NTIS HC A03/MF A01

Mathematical optimization techniques in the design process and their use by designers are discussed. The principles underlying these techniques and the requirements for a flexible optimization system having a broad applicability are considered. Optimization techniques used in aeronautical engineering are reviewed and illustrated with the examples of the System for the Analysis and Constrainted Minimization of Induced Drag and Computational Aerodynamic Design-by-Optimization System. **AN EXPERIMENT IN SOFTWARE RELIABILITY Final Report**

J. R. DUNHAM and J. L. PIERCE May 1986 62 p
(Contract NAS1-16489)
(NASA-CR-172553; NAS 1.26:172553; REPT-412U-2094-12; REPT-412U-2094-14) Avail: NTIS HC A04/MF A01 CSCL 09B

The results of a software reliability experiment conducted in a controlled laboratory setting are reported. The experiment was undertaken to gather data on software failures and is one in a series of experiments being pursued by the Fault Tolerant Systems Branch of NASA Langley Research Center to find a means of credibly performing reliability evaluations of flight control software. The experiment tests a small sample of implementations of radar tracking software having ultra-reliability requirements and uses n-version programming for error detection, and repetitive run modeling for failure and fault rate estimation. The experiment results agree with those of Nagel and Skrivan in that the program error rates suggest an approximate log-linear pattern and the individual faults occurred with significantly different error rates. Additional analysis of the experimental data raises new questions concerning the phenomenon of interacting faults. This phenomenon may provide one explanation for software reliability decay. M.G.

**LINEAR AND NONLINEAR DYNAMIC ANALYSIS OF REDUNDANT LOAD PATH BEARINGLESS ROTOR SYSTEMS Status Report**

V. R. MURTHY Dec. 1985 94 p
(Contract NAG2-306)
(NASA-CR-177098; NAS 1.26:177098) Avail: NTIS HC A05/MF A01 CSCL 12A

The bearingless rotorcraft offers reduced weight, less complexity and superior flying qualities. Almost all the current industrial structural dynamic programs of conventional rotors which consist of single load path rotor blades employ the transfer matrix method to determine natural vibration characteristics because this method is ideally suited for one dimensional chain like structures. This method is extended to multiple load path rotor blades without resorting to an equivalent single load path approximation. Unlike the conventional blades, it isk necessary to introduce the axial-degree-of-freedom into the solution process to account for the differential axial displacements in the different load paths. With the present extension, the current rotor dynamic programs can be modified with relative ease to account for the multiple load paths without resorting to the equivalent single load path modeling. The results obtained by the transfer matrix method are validated by comparing with the finite element solutions. A differential stiffness matrix due to blade rotation is derived to facilitate the finite element solutions. Author

**MULTIVARIABLE CONTROL SYSTEMS WITH SATURATING ACTUATORS ANTIRESET WINDUP STRATEGIES**

P. KAPASOURIS and M. ATHANS May 1985 6 p Sponsored in part by General Electric Co.
(Contract NAG2-297; NGL-22-009-124)
(NASA-CR-177100; NAS 1.26:177100; LIDS-P-1481) Avail: NTIS HC A02/MF A01 CSCL 12A

Preliminary, promising, results for introducing antireset windup (ARW) properties in multivariable feedback control systems with multiple saturating actuator nonlinearities and integrating actions are presented. The ARW method introduces simple nonlinear feedback around the integrators. The multiloop circle criterion is used to derive sufficient conditions for closed-loop stability that employ frequency-domain singular value tests. The improvement in transient response due to the ARW feedback is demonstrated using a 2-input 2-outpurt control system based upon F-404 jet engine dynamics. Author

A mathematical model is developed to describe the effect of aircraft-engine inlet geometry on the reflected and radiated acoustic field without flow, as studied experimentally using a spinning-mode synthesizer by Silcox (1983). The acoustic pressure in the inlet interior and exterior is modeled by a pure cylindrical azimuthal mode for the Helmholtz equation with hardwall boundary and by the Helmholtz equation and the radiation condition at infinity, respectively. The analytical approach to the solution of the resulting boundary-value problem and the program implementation are explained; numerical results are presented in tables and graphs; and the uniqueness of the problem is demonstrated. **WIND-TUNNEL ACOUSTIC RESULTS OF TWO ROTOR MODELS WITH SEVERAL TIP DESIGNS**

R. M. MARTIN and A. B. CONNOR Jul. 1986 191 p
(NASA-TM-87698; L-16081; NAS 1.15:87698) Avail: NTIS HC A09/MF A01 CSCL 20F

A three-phase research program has been undertaken to study the acoustic signals due to the aerodynamic interaction of rotorcraft main rotors and tail rotors. During the first phase, two different rotor models with several interchangeable tips were tested in the Langley 4- by 7-Meter Tunnel on the U.S. Army rotor model system. An extensive acoustic data base was acquired, with special emphasis on blade-vortex interaction (BVI) noise. The details of the experimental procedure, acoustic data acquisition, and reduction are documented. The overall sound pressure level

(OASPL) of the high-twist rotor systems is relatively insensitive to flight speed but generally increases with rotor tip-path-plane angle. The OASPL of the high-twist rotors is dominated by acoustic energy in the low-frequency harmonics. The OASPL of the low-twist rotor systems shows more dependence on flight speed than the high-twist rotors, in addition to being quite sensitive to tip-path-plane angle. An integrated band-limited sound pressure level, limited by 500 to 3000 Hz, is a useful metric to quantify the occurrence of BVI noise. The OASPL of the low-twist rotors is strongly influenced by the band-limited sound levels, indicating that the blade-vortex impulsive noise is a dominant noise source for this rotor design. The midfrequency acoustic levels for both rotors show a very strong dependence on rotor tip-path-plane angle. The tip-path-plane angle at which the maximum midfrequency sound level occurs consistently decreases with increasing flight speed. The maximum midfrequency sound level measured at a given location is constant regardless of the flight speed. Author

**EXPERIMENTAL STUDY USING NEARFIELD ACOUSTIC HOLOGRAPHY OF SOUND TRANSMISSION THROUGH FUSELAGE SIDEWALL STRUCTURES Final Report**
J. D. MAYNARD 1986 70 p
(Contract NAG1-216)
(NASA-CR-177162; NAS 1.26:177162) Avail: NTIS HC A04/MF A01 CSCL 20A

The reduction of cabin noise in lightweight, propeller-driven aircraft is an especially difficult problem in noise control. Nearfield Acoustic Holography (NAH) was used to determine the mode of vibration and acoustic intensity for panels which differed in: construction (number of stiffening ribs, size of stifening ribs, construction material, and panel surface curvature); boundary support condition (free edge condition or clamped edge condition); and mode of excitation (structural-borne forces or airborne forces). The different samples of aircraft panels are described and the measurement of the natural response frequencies was discussed under various boundary support and excitation conditions. The results of the NAH measurements are presented. B.G.

**MODELING THE EFFECTS OF WIND TUNNEL WALL ABSORPTION ON THE ACOUSTIC RADIATION CHARACTERISTICS OF PROPELLERS**
K. J. BAUMEISTER and W. EVERSMAN (Missouri Univ., Rolla.) Jul. 1986 21 p Presented at the 10th Aeroacustics Conference, Seattle, Wash., 9-11 Jul. 1986; sponsored by AIAA
(NASA-TM-87333; E-2812; NAS 1.15:87333; AIAA-86-1876)
Avail: NTIS HC A02/MF A01 CSCL 20A

Finite element theory is used to calculate the acoustic field of a propeller in a soft walled circular wind tunnel and to compare the radiation patterns to the same propellar in free space. Parametric solutions are present for a 'Gutin' propeller for a variety of flow Mach numbers, admittance values at the wall, microphone position locations, and propeller to duct radius ratios. Wind tunnel boundary layer is not included in this analysis. For wall admittance nearly equal to the characteristic value of free space, the free field and ducted propeller models agree in pressure level and directionality. In addition, the need for experimentally mapping the acoustic field is discussed. Author

**INTERACTION OF AIRBORNE AND STRUCTUREBORNE NOISE RADIATED BY PLATES. VOLUME 2: EXPERIMENTAL STUDY**
M. C. MCGARY Jul. 1986 36 p
(NASA-TM-87747; NAS 1.15:87747) Avail: NTIS HC A03/MF A01 CSCL 20A

The interaction of airborne and structureborne noise radiated by aircaraft materials was studied. The results corroborate the findings of an earlier analytical study by showing that the noise radiation of vibrating plates due to combined airborne and structureborne inputs possesses a stong synergistic nature. The large influence of the interaction between the airborne and structureborne inputs was hitherto ignored by researchers of aircraft interior noise problems. Author

**INTERACTION OF AIRBORNE AND STRUCTUREBORNE NOISE RADIATED BY PLATES. VOLUME 1: ANALYTICAL STUDY**
M. C. MCGARY Jul. 1986 61 p
(NASA-TM-87746; NAS 1.15:87746) Avail: NTIS HC A04/MF A01 CSCL 20A

The interaction of airborne and structureborne noise radiated by aircraft materials was examined. The theory and results of several computer simulations of the noise radiated by thin, isotropic, rectangular aluminum plates due to fully coherent combined acoustic and vibrational inputs is presented. The most significant finding was the extremely large influence that the relative phase between inputs has on the combined noise radiation of the plates. Phase dependent effects manifest themselves as cross terms in both the dynamic and acoustic portions of the analysis. Computer simulations show that these cross terms can radically alter the combined sound power radiated by plates constructed of aircraft-type materials. The results suggest that airborne-structureborne interactive effects could be responsible for a significant portion of the overall noise radiated by aircraft-type structures in the low frequency regime. This implies that previous analytical and experimental studies may have neglected an important physical phenomenon in the analayses of the interior noise of propeller dirven aircraft. Author

**A STUDY ON THE TRANSMISSION OF SOUND THROUGH FLOW DUCTS OF VARYING CROSS SECTION**
S. W. RIENSTRA 15 Oct. 1983 50 p
(Contract NIVR-311.4-1946)
(NLR-TR-83128-U; B8660348; ESA-86-97503) Avail: NTIS HC A03/MF A01

Sound propagation through axially varying ducts with mean flow is studied. Analytical theories for low and high frequencies are derived. A computer program for Nayfeh's (1980) wave envelope approach was tested to see if bottlenecks could be identified, what parameter range is attainable, and to what extent the classical uniform duct model produces satisfactory results. Although in principle amenable to high frequencies and circumferential periodicities, the method has parts of purely numerical nature, which do not allow a too detailed field; for sound propagating into a contraction (the usual case in a turbo engine intake) the prediction of the uniform duct model seems to be always conservative. A spectacular increase of the reflected wave is found for a combination of high Mach number and thin boundary layer in the contraction. ESA

**OPTIMAL COOPERATIVE CONTROL SYNTHESIS OF ACTIVE DISPLAYS Final Report**
S. GARG and D. K. SCHMIDT 22 Oct. 1985 160 p
(Contract NAG2-228)
(NASA-177102; NAS 1.177102) Avail: NTIS HC A08/MF A01 CSCL 20F

A technique is developed that is intended to provide a systematic approach to synthesizing display augmentation for optimal manual control in complex, closed-loop tasks. A cooperative control synthesis technique, previously developed to design pilot-optimal control augmentation for the plant, is extended to incorporate the simultaneous design of performance enhancing displays. The technique utilizes an optimal control model of the man in the loop. It is applied to the design of a quickening control law for a display and a simple K/s(2) plant, and then to an F-15 type aircraft in a multi-channel task. Utilizing the closed loop modeling and analysis procedures, the results from the display

design algorithm are evaluated and an analytical validation is performed. Experimental validation is recommended for future efforts.

**THE T800 TURBINE ENGINE SOLICITATION - A NEW THRUST IN STREAMLINING THE ACQUISITION PROCESS**
J. ACURIO and P. E. BROWN (U.S. Army, Aviation Research and Technology Activity, Fort Eustis, VA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 8 p.
(AIAA PAPER 86-1669)

The request-for-proposal of the T800 engine to be used by the LHX family of military helicopters was structured to reflect interest in a performance-oriented product, stating requirements and defining boundaries without detailing the methods by which results are to be achieved. This resulted in manufacturers' greater flexibility in parametric tradeoff considerations leading to design optimization. Each proposal received gave detailed commitments and guarantees, citing liabilities that would be explicitly for failure to meet contractual requirements.

**A SUPPORTABILITY STRATEGY FOR 1995**
J. T. RADEMACHER and G. C. NICHOLSON (General Electric Co., Cincinnati, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 22nd, Huntsville, AL, June 16-18, 1986. 8 p.
(AIAA PAPER 86-1670)

The use of the Advanced Tactical Fighter in conjunction with the Joint Advanced Fighter Engine to meet such military requirements as supportability, reliability, maintainability and life cycle cost is discussed. Particular attention is given to an approach for handling the evolution in power plant supportability requirements. The GE37 engine which contains fewer engine components, simpler support equipment, a rational engine module design, and integrally bladed disks is presented as a means of demonstrating the success of the logistics support analysis (LSA) process. It is concluded that the proposed weapon system will both lead the way in the LSA process as well as lay the groundwork for the design systems and infrastructure needed to exploit the emerging technologies of computer aided logistics support in the 1990's.

**DEVELOPING A MAINTENANCE CONCEPT FOR FUTURE ELECTRONIC SYSTEMS**
R. O. BLEAU (USAF, Electronic Systems Div., Bedford, MA) AIAA and SOLE, Aerospace Maintenance Conference, 2nd, San Antonio, TX, May 21-23, 1986. 6 p.
(AIAA PAPER 86-1145)

A team composed of U.S. Air Force acquisitions logisticians and prime contractor logistics and design engineers has used several analytical approaches to identify improvements in maintenance support, design, and logistics contracting strategies. The combination of design and support concepts thus achieved increased system supportability at reduced life cycle cost, and yielded a more combat-capable system. Major focuses of the analytic method used were life cycle costs, capabilities, and flexibility.

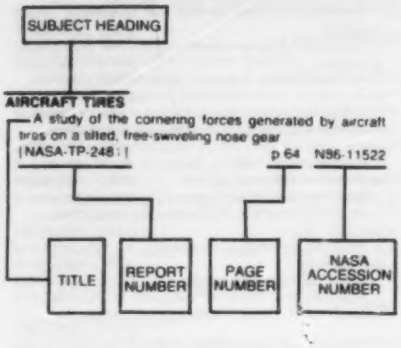
# SUBJECT INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 206)* November 1986

## Typical Subject Index Listing



The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

**AERODYNAMIC STALLING**
Axial-flow fan stalling behavior with circumferential inlet sectoring
[AIAA PAPER 86-1622] p 626 A86-42756
Reverse flow in multistage axial compressors
[AIAA PAPER 86-1747] p 627 A86-42825
**AERODYNAMICS**
Application of a supersonic Euler code (SWINT) to wing-body-tail geometries p 624 A86-41697
Numerical Navier-Stokes solutions of high speed propeller flows
[AIAA PAPER 86-1538] p 626 A86-42700
Theoretical and experimental investigation of test cell aerodynamics for turbofan applications
[AIAA PAPER 86-1732] p 656 A86-42819
**AEROELASTICITY**
Viscous effects on transonic airfoil stability and response p 623 A86-40110
Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2)
[NASA-TM-87677] p 639 N86-28075
Aeroelastic tests of OA 206 and OA 207 profiles
[ONERA-RT-22/1841-RY-310-R] p 641 N86-28942
Individual-blade-control research in the MIT VTOL Technology Laboratory 1977-1985
[NASA-CR-177121] p 654 N86-28954
Flutter prediction for a wing with active aileron control
[NASA-CR-176994] p 655 N86-28959
**AEROSPACE ENGINEERING**
Activities report in aerospace research
[ESA-86-97190] p 622 N86-28907
**AEROSPACE SYSTEMS**
Activities report in aerospace research
[ESA-86-97190] p 622 N86-28907
**AEROSPACEPLANES**
Mastering the transatmosphere p 658 A86-41274
**AEROTHERMODYNAMICS**
Flight effects on noise from coaxial dual flow. II - Heated jets p 644 A86-41706
Measured and predicted heating distributions for biconics at Mach 10 p 624 A86-41734
Solution of problems of conjugate heat transfer during flow past bodies of different shape p 673 A86-43370
**AGING (METALLURGY)**
Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys
p 660 A86-40303
**AILERONS**
Flutter prediction for a wing with active aileron control
[NASA-CR-176994] p 655 N86-28959
**AIR**
Apparatus for the preparation of air
[AD-A165603] p 673 N86-28266
**AIR BREATHING ENGINES**
Solid fuel gas generator air — Air TurboRamjet
[AIAA PAPER 86-1682] p 649 A86-42792
**AIR CONDITIONING EQUIPMENT**
Apparatus for the preparation of air
[AD-A165603] p 673 N86-28266
**AIR FLOW**
Effect of different hydrogen-injection techniques on its burnup in a supersonic air flow p 664 A86-43420
**AIR INTAKES**
Experimental study of supersonic flow around a single-stage wedge with cheeks at sideslip angles
p 629 A86-43404
**AIR NAVIGATION**
Integrated navigation, communication, and surveillance systems based on standard distance measuring equipment p 635 A86-40116
**AIR TO AIR MISSILES**
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080
**AIR TRAFFIC CONTROL**
Computerisation of air information services in France
p 635 A86-40229
The French air traffic control system today - A paradox p 635 A86-40230
Language problems in air traffic control
p 635 A86-40570
System and technology considerations for space-based air traffic surveillance
[AIAA PAPER 86-1170] p 658 A86-40581
Sophistication and safety in a semi-automated air traffic control system p 635 A86-41874
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28040
Time-based air traffic management using expert systems
[NASA-TM-88234] p 634 N86-28068
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172583] p 636 N86-28074
A comparison of the effects of two traffic alert and collision avoidance systems (TCAS 3 and TCAS 2) on the performance of the Air Traffic Control Radar Beacon System
[DOT/FAA/PM-86/8] p 636 N86-28930
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939
An investigation of TNAV equipped aircraft in a simulated en route metering environment
[NASA-CR-178031] p 641 N86-28940
**AIR TRAFFIC CONTROLLERS (PERSONNEL)**
The French air traffic control system today - A paradox p 635 A86-40230
**AIRBORNE SURVEILLANCE RADAR**
Elimination of directional wave spectrum contamination from noise in elevation measurements
p 641 A86-40854
Mil-DAP: Its architecture and role as a real time airborne digital signal processor p 661 N86-28359
The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369
**AIRBORNE/SPACEBORNE COMPUTERS**
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172583] p 636 N86-28074
An experiment in software reliability
[NASA-CR-172553] p 662 N86-29547
**AIRCRAFT ACCIDENT INVESTIGATION**
Annual review of aircraft accident data. US air carrier operations: Calendar year 1982
[PB86-212529] p 634 N86-28929
**AIRCRAFT ACCIDENTS**
Aircraft accident report: China Airlines Boeing 747-SP, N4522V 300 nautical miles northwest of San Francisco, California, February 19, 1985
[PB86-910403] p 634 N86-28069
Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue number 10 of 1984 accidents
[PB86-916906] p 634 N86-28070
Annual review of aircraft accident data. US air carrier operations: Calendar year 1982
[PB86-212529] p 634 N86-28929
**AIRCRAFT APPROACH SPACING**
Time-based air traffic management using expert systems
[NASA-TM-88234] p 634 N86-28068
**AIRCRAFT BRAKES**
Carbon-carbon composites for braking
p 661 A86-40364
**AIRCRAFT COMMUNICATION**
Radio telephony - A case for growing concern
p 635 A86-40569
Future Aeronautical Communication System (FACS): Report
[ESA-86-96959] p 673 N86-28309
**AIRCRAFT CONFIGURATIONS**
A computer-augmented procedure for commercial aircraft configuration development and optimization
p 637 A86-40114
Turbofan and propfan as basis for future economic propulsion concepts
[AIAA PAPER 86-1474] p 645 A86-42862
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88228] p 630 N86-28062
**AIRCRAFT CONSTRUCTION MATERIALS**
Overview — of new metallic and nonmetallic aircraft materials p 659 A86-40252
Production of aluminium-lithium alloy with high specific properties p 659 A86-40255
'Alithalite' alloys - Progress, products and properties
p 660 A86-40256
Comparison of corrosion behaviour of lithium-containing aluminium alloys and conventional aerospace alloys
p 660 A86-40260
Experiences in FRG in aerospace application — of carbon fiber reinforced plastics p 661 A86-40498
Experiences in UK and France in aerospace application — of glass and carbon fiber reinforced composites
p 621 A86-40499
Structural materials in aeronautics. II - Prospects and perspectives p 662 A86-40619
A fiber optic damage monitor p 670 A86-41605
Application of medical computed tomography (CT) scanners to advanced aerospace composites
p 670 A86-41631
Thermoplastic composites - Design material of the 1990s? p 663 A86-41685
New alloys from the quantum engineer
p 663 A86-42424
Small turboshaft/turboprop engine technology study
[AIAA PAPER 86-1623] p 647 A86-42757
Chemical control for Airbus composites. HPLC standardization
[I-104/84] p 664 N86-28133
New transparent solid material for helicopter windshields
[SNPE-NT-37/85/CRB/NP] p 641 N86-28941
The future of surface treatments in aeronautical construction
[SNIAS-861-551-101] p 665 N86-29037
**AIRCRAFT CONTROL**
The measurement of aircraft performance and stability and control after flight through natural icing conditions
[AIAA PAPER 86-9758] p 651 A86-40681
The design of a sliding mode controller for dutch roll damping in a non-linear aircraft system
p 651 A86-40766
Design issues for fault tolerant-restructurable aircraft control p 652 A86-42937
Identification of frequency characteristics during bench tests p 681 A86-43367
Initial design and evaluation of automatic restructurable flight control system concepts
[NASA-CR-178064] p 652 N86-28090
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data
[NASA-TM-87632-PT-2] p 653 N86-28093
Control systems for the Airbus design and functional experience — cockpits
[ESA-86-96936] p 653 N86-28094
Apparatus for the preparation of air
[AD-A165603] p 673 N86-28266
**AIRCRAFT DESIGN**
Computer sizing of fighter aircraft
[AIAA PAPER 85-0212] p 637 A86-40106
Airfoil optimization p 623 A86-40107
A computer-augmented procedure for commercial aircraft configuration development and optimization
p 637 A86-40114
Dual-wing systems with decalage angle optimization
p 624 A86-40121
Beech's enterprising Starship p 637 A86-40471
Which transport technologies will fly?
p 621 A86-41037
Effect of engine technology on advanced fighter design and cost p 644 A86-41691
A forward-swept-wing fighter configuration designed by a transonic computational method p 638 A86-41696
Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715
A theoretical study of deltoid planforms operating in the ground effect region p 628 A86-41977
Small turboshaft/turboprop engine technology study
[AIAA PAPER 86-1623] p 647 A86-42757
Helicopter rotor and engine sizing for preliminary performance estimation
[AIAA PAPER 86-1756] p 638 A86-42829
Damage tolerance assessment of aircraft attachment lugs p 672 A86-43084

Influence of structural changes on the fuel-consumption efficiency of a transport aircraft p 638 A86-43380
NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076
The design of composite structures --- aircraft design
[SNIAS-861-111-103] p 640 N86-28082
Eigenvalues assignment method: An application to designing an autopilot
[SNIAS-861-111-106] p 653 N86-28095
The use of mathematical optimization techniques by the designer
[NLR-MP-85005-U] p 682 N86-28673
Activities report in aerospace research
[ESA-86-97190] p 622 N86-28907
General designer Balabuyev on An-124 Ruslan features p 623 N86-28910
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-179977] p 631 N86-28917
Aerodynamics of the Viggen 37 aircraft. Part 1: General characteristics at low speed
[NASA-TM-88403] p 632 N86-28925
Multivariable control of a forward swept wing aircraft
[NASA-CR-177112] p 654 N85-28953
Aeritalia: Avionics, optoelectronics research, ATR 42 p 642 N86-29080

**AIRCRAFT DETECTION**
Weibull-distributed ground clutter in the frequency domain p 671 A86-41883

**AIRCRAFT ENGINES**
Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 p 642 A86-40726
Compressor erosion and performance deterioration p 643 A86-40727
Factors relating to deterioration based on Rolls-Royce RB 211 in service performance p 643 A86-40730
Direct and system effects of water ingestion into jet engine compresors p 644 A86-40739
Substantiation of regimes for accelerated equivalent tests of gas-turbine aeroengines p 644 A86-41549
Automatic eddy current hole centering for aircraft engine components p 670 A86-41582
Effect of engine technology on advanced fighter design and cost p 644 A86-41691
After the big turbofans p 645 A86-42099
Development of 'CADEGA' CAD system for aero engine design p 645 A86-42425
S-duct inlet/diffusers for turboprop offset gearbox applications
[AIAA PAPER 86-1462] p 625 A86-42855
Air turbine test results for three turbine stages with varying radial distribution of camber
[AIAA PAPER 86-1467] p 645 A86-42657
Turboprop and open rotor propulsion for the future
[AIAA PAPER 86-1472] p 645 A86-42660
UHB technology flight validation program --- Ultra High Bypass engines for large passenger aircraft
[AIAA PAPER 86-1473] p 656 A86-42661
Turbofan and propfan as basis for future economic propulsion concepts
[AIAA PAPER 86-14 4] p 645 A86-42662
Altitude ignition/lean deceleration study
[AIAA PAPER 86-1530] p 646 A86-42694
Development of the Boeing 767 thrust reverser
[AIAA PAPER 86-1536] p 646 A86-42698
Dynamic pressure loads associated with twin supersonic plume resonance
[AIAA PAPER 86-1539] p 646 A86-42701
Rotorcraft propulsion for year 2000 plus
[AIAA PAPER 86-1543] p 646 A86-42702
Small engine technology payoffs for future commuter aircraft
[AIAA PAPER 86-1544] p 646 A86-42703
High performance, stratified charge rotary engines for general aviation
[AIAA PAPER 86-1553] p 647 A86-42710
Advanced rotary engine components utilizing fiber reinforced Mg castings
[AIAA PAPER 86-1559] p 663 A86-42712
Transient engine performance with water ingestion
[AIAA PAPER 86-1621] p 647 A86-42755
Small engine propulsion readiness for the 21st century
[AIAA PAPER 86-1624] p 647 A86-42758
Propfan test assessment (PTA) quick engine change (QEC) nacelle
[AIAA PAPER 86-1626] p 648 A86-42759
A turbine engine inlet viewing system
[AIAA PAPER 86-1647] p 656 A86-42769
Design for engine supportability
[AIAA PAPER 86-1671] p 648 A86-42784
A design approach to a performance seeking control — for fighter aircraft engines
[AIAA PAPER 86-1674] p 652 A86-42785
Test and evaluation of the HIDEC engine uptrim algorithm --- Highly Integrated Digital Electronic Control for aircraft
[AIAA PAPER 86-1676] p 648 A86-42787
Advances in aero engine dynamics
[AIAA PAPER 86-1677] p 648 A86-42788
An overview of USAF engine diagnostic systems
[AIAA PAPER 86-1679] p 649 A86-42790
Using Derivative engine technology to achieve maturity goals
[AIAA PAPER 86-1752] p 649 A86-42826
Propulsion education at the Air Force Institute of Technology
[AIAA PAPER 86-1754] p 684 A86-42827
Performance estimation of the mixed flow, afterburning, cooled, two-spool turbofan engine with bleed and power extraction
[AIAA PAPER 86-1757] p 649 A86-42830
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105
Use of protective coatings in aero gas turbine engines p 664 A86-43147
Calculation of the characteristics of a multistage gas turbine with allowance for the circumferential nonuniformity of inlet temperature p 649 A86-43381
Generalization of experimental data on the internal hydraulic resistance of laminated porous materials p 650 A86-43383
Theory of the motion of propeller blades for large displacements p 639 A86-43385
The development of a model for the unstable operation of a turbocompressor and the design of a device to protect a gas turbine engine against stalling and surging p 650 A86-43390
Modeling the combustion zone of gas-turbine-engine combustion chambers p 650 A86-43393
X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430
Laser fringe anemometry for aero engine components
[NASA-TM-88798] p 629 N86-28053
Development of a portable wear metal analyzer for field use
[AD-A166013] p 622 N86-28906
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236
Aero-engine gears: Manufacturing cracks and their effect on operation p 677 N86-29239
Design and calculation of high speed engine bearings p 677 N86-29241
Requirements on lubricatin oil from the view of a helicopter manufacturer p 666 N86-29244
Military aircraft propulsion lubricants: Current and future trends p 666 N86-29249
Aircraft engine oils and their behaviour at high temperatures p 667 N86-29251
Scoring tests of aircraft transmission lubricants at high speeds and high temperatures p 667 N86-29253

**AIRCRAFT EQUIPMENT**
Layout of electrical equipment on an aircraft with allowance for equipment size constraints in the framework of computer-aided design p 639 A86-43389
Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage
[DOT/FAA/PM-86/25,1] p 642 N86-28944

**AIRCRAFT FUEL SYSTEMS**
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft
[NASA-TM-87706] p 675 N86-28385

**AIRCRAFT GUIDANCE**
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049

**AIRCRAFT HAZARDS**
The measurement of aircraft performance and stability and control after flight through natural icing conditions
[AIAA PAPER 86-9758] p 651 A86-40681
Compressor erosion and performance deterioration p 643 A86-40727
Protecting electronics against lightning gets harder p 633 A86-41034
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695
From a strike to a kill p 634 A86-42423

**AIRCRAFT INSTRUMENTS**
The calculation of the entropy distribution along cloud traverses using aircraft measurements p 678 A86-40555
Protecting electronics against lightning gets harder p 633 A86-41034
Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys
[PB86-184314] p 665 N86-28186
Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage
[DOT/FAA/PM-86/25,1] p 642 N86-28944

**AIRCRAFT LANDING**
Design technique to reduce effects of tidal variations on an ILS glide slope system p 635 A86-41335
Development of the Boeing 767 thrust reverser
[AIAA PAPER 86-1536] p 646 A86-42698
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049
Aircraft barricade
[AD-D012194] p 656 N86-28102
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950

**AIRCRAFT LAUNCHING DEVICES**
CTOL ski jump - Analysis, simulation, and flight test p 637 A86-40113

**AIRCRAFT MAINTENANCE**
Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052
Bringing on the B-1B p 621 A86-41276
Composite repair techniques examined p 662 A86-41684
Delivery of B-1B changes maintenance procedures p 621 A86-41800
R&M 2000 - A look to the future --- Air Force Reliability and Maintainability
[AIAA PAPER 86-1668] p 672 A86-42781
An overview of USAF engine diagnostic systems
[AIAA PAPER 86-1679] p 649 A86-42790
Prospects for intelligent aerospace structures
[AIAA PAPER 86-1139] p 672 A86-43328
Composite repair at the Naval Air Rework Facility, North Island --- composite aircraft structures
[AIAA PAPER 86-1140] p 664 A86-43329
Expert systems for aviation maintenance
[AIAA PAPER 86-1143] p 622 A86-43332
Developing a maintenance concept for future electronic systems
[AIAA PAPER 86-1145] p 684 A86-43333

**AIRCRAFT MANEUVERS**
Transfer of alignment and calibration of multiple sensors in flexible systems p 681 A86-43003

**AIRCRAFT MODELS**
An analysis of a four state model for pursuit-evasion games --- during air combat p 680 A86-42957
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[NASA-TM-88216] p 629 N86-28056
NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076

**AIRCRAFT NOISE**
The influence of source location on the structural-acoustic interaction of cylinders --- in aerodynamics p 638 A86-41710
Counter-rotation prop-fan optimization
[AIAA PAPER 86-1470] p 645 A86-42659
Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study
[NASA-TM-87747] p 683 N86-29632
Interaction of airborne and structureborne noise radiated by plates. Volume 1: Analytical study
[NASA-TM-87746] p 683 N86-29633

**AIRCRAFT PARTS**
Layout of electrical equipment on an aircraft with allowance for equipment size constraints in the framework of computer-aided design p 639 A86-43389
Tribology in aircraft systems: Basic principles and applications p 677 N86-29240

**AIRCRAFT PERFORMANCE**
The measurement of aircraft performance and stability and control after flight through natural icing conditions
[AIAA PAPER 86-9758] p 651 A86-40681
Pilot report - B-1B p 634 A86-41275
Canard/tail comparison for an advanced variable-sweep-wing fighter p 637 A86-41688
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092

**AIRCRAFT PILOTS**
Radio telephony - A case for growing concern p 635 A86-40569
Aircraft accident report: China Airlines Boeing 747-SP, N4522V 300 nautical miles northwest of San Francisco, California, February 19, 1985
[PB86-910403] p 634 N86-28069

**AIRCRAFT POWER SUPPLIES**
Digital simulation of regulated electrical power supplies for military applications p 669 A86-40775

Multifunctional requirements for a gearbox secondary power system in a modern fighter aircraft and its components and interface requirements p 678 N86-29243

**AIRCRAFT PRODUCTION**

UHB technology flight validation program --- Ultra High Bypass engines for large passenger aircraft [AIAA PAPER 86-1473] p 656 A86-42661

**AIRCRAFT RELIABILITY**

An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41596

R&M 2000 - A look to the future --- Air Force Reliability and Maintainability [AIAA PAPER 86-1668] p 672 A86-42781

Design for engine supportability [AIAA PAPER 86-1671] p 648 A86-42784

**AIRCRAFT SAFETY**

The market price for air safety p 633 A86-40228

Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232

Naces - Today's ultimate seat p 637 A86-40472

Probabilistic damage tolerance analysis of aircraft structures [FFA-TN-1985-68] p 640 N86-28081

A simplified model of the turbulent microburst [NASA-CR-177108] p 679 N86-29466

**AIRCRAFT STABILITY**

The measurement of aircraft performance and stability and control after flight through natural icing conditions [AIAA PAPER 86-9758] p 651 A86-40681

Application of parameter estimation to highly unstable aircraft [NASA-TM-88266] p 639 N86-28078

**AIRCRAFT STRUCTURES**

Robotic nondestructive inspection of aerospace structures p 668 A86-40509

Characterization of T300/V-378A graphite/bismaleimide for structural applications p 662 A86-41053

Composite repair techniques examined p 682 A86-41684

Design of a carbon-fiber reinforced wing for the Alpha-Jet major panel tests p 638 A86-41692

Composite repair at the Naval Air Rework Facility, North Island --- composite aircraft structures [AIAA PAPER 86-1140] p 664 A86-43329

NASTRAN/FLEXSTAB procedure for static aeroelastic analysis [NASA-TM-84897] p 639 N86-28076

Probabilistic damage tolerance analysis of aircraft structures [FFA-TN-1985-68] p 640 N86-28081

The design of composite structures --- aircraft design [SNIAS-861-111-103] p 640 N86-28082

Stress intensity factor in an integral or bonded stiffened panel using an analytical method --- aircraft structures [SNIAS-861-111-104] p 676 N86-28481

Experimental study using nearfield acoustic holography of sound transmission through fuselage sidewall structures [NASA-CR-177162] p 683 N86-28702

An introductory course on aircraft loading [NLR-MP-84090-U] p 641 N86-28943

Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study [NASA-TM-87747] p 683 N86-29632

**AIRCRAFT TIRES**

Development of an operating profile for aircraft tires [FAA/CT-85-32] p 677 N86-29218

**AIRCRAFT WAKES**

Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693

**AIRFIELD SURFACE MOVEMENTS**

Airport surface navigation and traffic control p 635 A86-40227

**AIRFOIL PROFILES**

Design of transonic airfoils with given pressure, subject to geometric constraints [NLR-TR-84064-U] p 633 N86-28925

**AIRFOILS**

Airfoil optimization p 623 A86-40107

Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112

Optical determination of the effects of a microminiature accelerometer on resonance of a small airfoil p 668 A86-40712

Application of continuous vorticity panels to general unsteady incompressible two-dimensional lifting flows p 624 A86-41690

Turbine airfoil LCF life prediction verification [AIAA PAPER 86-1496] p 646 A86-42672

Multi-stage compressor airfoil aerodynamics. I - Airfoil potential flow analysis [AIAA PAPER 86-1744] p 627 A86-42822

A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results [NASA-CR-176963] p 631 N86-28919

Experimental analyses of trailing edge flows [NASA-CR-176904] p 632 N86-28921

Critical evaluation of the unsteady aerodynamics approach to dynamic stability at high angles of attack [NASA-CR-177104] p 632 N86-28924

First order analysis of the effect of pitching on the drag coefficient [DE86-006324] p 633 N86-28926

**AIRLINE OPERATIONS**

The market price for air safety p 633 A86-40228

Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232

Sophistication and safety in a semi-automated air traffic control system p 635 A86-41874

Annual review of aircraft accident data. US air carrier operations: Calendar year 1982 [PB86-212529] p 634 N86-28929

**AIRPORT PLANNING**

STOLport London - A design for safety p 655 A86-40226

Runway requirements in instrument flight traffic at regional airports and commercial landing areas p 635 A86-41873

**AIRPORT SURFACE DETECTION EQUIPMENT**

The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369

**AIRPORTS**

Airport surface navigation and traffic control p 635 A86-40227

Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria [DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

**AIRSHIPS**

A theoretical study of deltoid planforms operating in the ground effect region p 638 A86-41977

**ALGORITHMS**

Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane [NASA-CR-172593] p 636 N86-28074

Test and evaluation of the HIDEC engine uptrim algorithm [NASA-TM-88262] p 650 N86-28088

Initial design and evaluation of automatic restructurable flight control system concepts [NASA-CR-178064] p 652 N86-28090

Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors [NASA-TM-86998] p 637 N86-28933

Design requirements and development of an airborne descent path definition algorithm for time navigation [NASA-CR-178037] p 641 N86-28939

Prediction of the stability performance of a turboreactor combustion chamber [SNECMA-YKC-3269/85] p 651 N86-28949

Multi-input, multi-output system control for experimental aircraft [NASA-CR-177017] p 654 N86-28955

**ALIGNMENT**

Transfer of alignment and calibration of multiple sensors in flexible systems p 681 A86-43003

**ALLOYS**

Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys [PB86-184314] p 665 N86-28186

**ALPHA JET AIRCRAFT**

Design of a carbon-fiber reinforced wing for the Alpha-Jet major panel tests p 638 A86-41692

**ALUMINUM ALLOYS**

Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford University, England, July 8-11, 1985 p 659 A86-40251

Overview --- of new metallic and nonmetallic aircraft materials p 659 A86-40252

Production of aluminium-lithium alloy with high specific properties p 659 A86-40255

'Alithalite' alloys - Progress, products and properties p 660 A86-40256

Adhesive bonding of aluminium-lithium alloys p 660 A86-40267

Comparison of corrosion behaviour of lithium-containing aluminium alloys and conventional aerospace alloys p 660 A86-40280

Textures developed in Al-Li-Cu-Mg alloy p 660 A86-40291

Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys p 660 A86-40303

Development of properties within high-strength aluminium-lithium alloys p 660 A86-40304

Age hardening behavior of DTD XXXA --- high-strength aluminum-lithium alloy (Lital A) p 660 A86-40305

Effect of precipitation on mechanical properties of Al-Li-Cu-Mg-Zr alloy p 661 A86-40306

Deformation and fracture in Al-Li base alloys p 661 A86-40312

Structural materials in aeronautics. II - Prospects and perspectives p 662 A86-40619

**ALUMINUM COATINGS**

Use of protective coatings in aero gas turbine engines p 664 A86-43147

**AMERICIUM ISOTOPES**

Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft [NASA-TM-87706] p 675 N86-28385

**AMOUNT**

Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft [NASA-TM-87706] p 675 N86-28385

**ANALYTIC FUNCTIONS**

Stress intensity factor in an integral or bonded stiffened panel using an analytical method --- aircraft structures [SNIAS-861-111-104] p 676 N86-28481

**ANALYZERS**

Development of a portable wear metal analyzer for field use [AD-A168013] p 622 N86-28906

**ANGLE OF ATTACK**

A numerical analysis applied to high angle of attack three-dimensional inlets [AIAA PAPER 86-1527] p 627 A86-42760

Multiaxis aircraft control power from thrust vectoring at high angles of attack [NASA-TM-87741] p 629 N86-28054

Experimental analyses of trailing edge flows [NASA-CR-176904] p 632 N86-28921

**ANISOTROPIC MEDIA**

A large displacement formulation for anisotropic beam analysis p 671 A86-42075

**ANNULAR FLOW**

Calculation of annular nozzle trisonic flowfields by the method of characteristics [AIAA PAPER 86-1519] p 625 A86-42686

**ANODIC COATINGS**

Adhesive bonding of aluminium-lithium alloys p 660 A86-40267

**ANTENNA COUPLERS**

VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation) [AD-A165897] p 676 N86-29119

**ANTENNA RADIATION PATTERNS**

Design technique to reduce effects of tidal variations on an ILS glide slope system p 635 A86-41335

**ANTENNAS**

Siting criteria for Microwave Landing Systems (MLS) [FAA/PM-86/18] p 636 N86-28073

**APPLICATIONS PROGRAMS (COMPUTERS)**

Bringing on the B-1B p 621 A86-41276

Delivery of B-1B changes maintenance procedures p 621 A86-41800

Time-based air traffic management using expert systems [NASA-TM-88234] p 634 N86-28068

A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results [NASA-CR-176963] p 631 N86-28919

**ARCHITECTURE (COMPUTERS)**

The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems [AGARD-CP-380] p 674 N86-28337

Mil-DAP: Its architecture and role as a real time airborne digital signal processor p 681 N86-28359

The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372

Investigation of an advanced fault tolerant integrated avionics system [NASA-CR-176980] p 642 N86-28945

**ARMED FORCES (UNITED STATES)**

An overview of USAF engine diagnostic systems [AIAA PAPER 86-1679] p 649 A86-42790

**ARRESTING GEAR**

Aircraft barricade [AD-D012194] p 656 N86-28102

**ARTIFICIAL INTELLIGENCE**

The impact of artificial intelligence on airborne maritime reconnaissance p 675 N86-28374

Pilot interaction with automated airborne decision making systems [NASA-CR-177002] p 679 N86-29508

**AUTOCLAVES**

Autoclave, compression moulding p 668 A86-40495

**AUTOMATED EN ROUTE ATC**

Sophistication and safety in a semi-automated air traffic control system p 635 A86-41874

**AUTOMATIC FLIGHT CONTROL**
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data
[NASA-TM-87632-PT-2] p 653 N86-28093
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950
The integrated manual and automatic control of complex flight systems
[NASA-CR-177086] p 654 N86-28952
Nonlinear control of aircraft
[NASA-TM-89225] p 655 N86-28956

**AUTOMATIC LANDING CONTROL**
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950

**AUTOMATIC PILOTS**
Aircraft accident report: China Airlines Boeing 747-SP, N4522V 300 nautical miles northwest of San Francisco, California, February 19, 1985
[PB86-910403] p 634 N86-28069
Eigenvalues assignment method: An application to designing an autopilot
[SNIAS-861-111-106] p 653 N86-28095

**AUTOMATION**
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049

**AUXILIARY PROPULSION**
Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems
[AIAA PAPER 86-1545] p 638 A86-42704

**AVIONICS**
Protecting electronics against lightning gets harder
p 633 A86-41034
Developing a maintenance concept for future electronic systems
[AIAA PAPER 86-1145] p 684 A86-43333
Main flight controls --- Airbus
[SNIAS-861-111-111] p 653 N86-28096
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337
The future of bipolar technology for avionics
p 674 N86-28341
Possible impacts of VHSIC on MIL-STD-1553B data transmission management p 674 N86-28371
The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372
The impact of very high performance integrated circuits on avionics system readiness p 674 N86-28373
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939
Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage
[DOT/FAA/PM-86/25,1] p 642 N86-28944
Investigation of an advanced fault tolerant integrated avionics system
[NASA-CR-176980] p 642 N86-28945
Aeritalia: Avionics, optoelectronics research, ATR 42
p 642 N86-29080
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119

**AXIAL FLOW TURBINES**
Redistribution of an inlet temperature distortion in an axial flow turbine stage
[AIAA PAPER 86-1468] p 671 A86-42658

**AXIAL LOADS**
Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052

**AXISYMMETRIC FLOW**
Application of a supersonic Euler code (SWINT) to wing-body-tail geometries p 624 A86-41697

**B**

**B-1 AIRCRAFT**
Pilot report - B-1B p 634 A86-41275
Bringing on the B-1B p 621 A86-41276
Delivery of B-1B changes maintenance procedures
p 621 A86-41800

**BARRIERS**
Mathematical model of the interaction of a single unsteady supersonic jet with a moving barrier of finite size p 628 A86-43401

**BEAMS (SUPPORTS)**
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361
A large displacement formulation for anisotropic beam analysis p 671 A86-42075

**BEARINGLESS ROTORS**
Linear and nonlinear dynamic analysis of redundant load path bearingless rotor systems
[NASA-CR-177098] p 682 N86-29579

**BEARINGS**
Effects of unfavorable environmental conditions on the service life of jet engine and helicopter bearings
p 677 N86-29238

**BINOCULAR VISION**
Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782

**BIPOLARITY**
The future of bipolar technology for avionics
p 674 N86-28341

**BIRD-AIRCRAFT COLLISIONS**
From a strike to a kill p 634 A86-42423

**BISMALEIMIDE**
Characterization of T300/V-378A graphite/bismaleimide for structural applications
p 662 A86-41053

**BLADE SLAP NOISE**
Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726
An analysis of blade vortex interaction aerodynamics and acoustics
[NASA-CR-177016] p 630 N86-28912

**BLADE TIPS**
Clearance effects on heat transfer at the tips of plain and grooved turbine airfoils p 644 A86-40737
Tip leakage reduction through tip injection in turbomachines
[AIAA PAPER 86-1746] p 627 A86-42824
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
An analysis of blade vortex interaction aerodynamics and acoustics
[NASA-CR-177016] p 630 N86-28912

**BLAST LOADS**
Response of an operational turbofan engine to a simulated nuclear blast p 643 A86-40728

**BLOWING**
The lift of sharp-leading-edged delta wings with blowing
[NASA-CR-176967] p 631 N86-28915

**BLOWOUTS**
Altitude ignition/lean deceleration study
[AIAA PAPER 86-1530] p 646 A86-42694

**BODY-WING AND TAIL CONFIGURATIONS**
Canard/tail comparison for an advanced variable-sweep-wing fighter p 637 A86-41688
Application of a supersonic Euler code (SWINT) to wing-body-tail geometries p 624 A86-41697

**BOEING 747 AIRCRAFT**
Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693
Aircraft accident report: China Airlines Boeing 747-SP, N4522V 300 nautical miles northwest of San Francisco, California, February 19, 1985
[PB86-910403] p 634 N86-28069

**BOEING 767 AIRCRAFT**
Development of the Boeing 767 thrust reverser
[AIAA PAPER 86-1536] p 646 A86-42698

**BOLTS**
Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052

**BOUNDARY LAYER CONTROL**
Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft
[NASA-CR-159251] p 639 N86-28077

**BOUNDARY LAYER FLOW**
The effect of a splitter plate as boundary layer removal system in half-model testing --- wings
[DFVLR-FB-85-64] p 657 N86-28969
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173

**BOUNDARY LAYER SEPARATION**
Effects of S-bends on diffuser internal performance and turbulence characteristics
[AIAA PAPER 86-1459] p 625 A86-42654
A study of the factors affecting boundary layer two-dimensionality in wind tunnels
[NASA-CR-177023] p 631 N86-28914

**BOUNDARY LAYER TRANSITION**
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375
A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919

**BOUNDARY LAYERS**
Boundary layer model to compute the edge effects in stratified composite plates
[ONERA-RT-7/3542-RY-041-R] p 678 N86-29279

**BOUNDARY VALUE PROBLEMS**
New applications of mu to real-parameter variation problems --- structured singular value theory for flight control systems stability analysis p 680 A86-42871
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88228] p 630 N86-28062
Computation of the transonic flow about a swept wing in the presence of an engine nacelle
[NASA-CR-177113] p 630 N86-28911
An analysis of blade vortex interaction aerodynamics and acoustics
[NASA-CR-177016] p 630 N86-28912
Wake shape and its effects on aerodynamic characteristics
[NASA-CR-178118] p 631 N86-28918

**BRAKES (FOR ARRESTING MOTION)**
Carbon-carbon composites for braking
p 661 A86-40364

**BRAKING**
Development of an operating profile for aircraft tires
[FAA/CT-85-32] p 677 N86-29218

**BRANCHING (MATHEMATICS)**
Critical evaluation of the unsteady aerodynamics approach to dynamic stability at high angles of attack
[NASA-CR-177104] p 632 N86-28924

**BUFFETING**
Investigation of empennage buffeting
[NASA-CR-177164] p 654 N86-28951

**BURNOUT**
Effect of different hydrogen-injection techniques on its burnup in a supersonic air flow p 664 A86-43420

**BURSTS**
Feasibility of generating an artificial burst in a turbulent boundary layer
[NASA-CR-4003] p 675 N86-28377

**BYPASS RATIO**
After the big turbofans p 645 A86-42099
UHB technology flight validation program --- Ultra High Bypass engines for large passenger aircraft
[AIAA PAPER 86-1473] p 656 A86-42661

**C**

**CALIBRATING**
Transfer of alignment and calibration of multiple sensors in flexible systems p 681 A86-43003
Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2)
[NASA-TM-87677] p 639 N86-28075
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080

**CAMBER**
Air turbine test results for three turbine stages with varying radial distribution of camber
[AIAA PAPER 86-1467] p 645 A86-42657

**CANARD CONFIGURATIONS**
Canard/tail comparison for an advanced variable-sweep-wing fighter p 637 A86-41688
A forward-swept-wing fighter configuration designed by a transonic computational method p 638 A86-41696

**CANOPIES**
Characterisation and influence of orientation and internal stress in acrylic aircraft materials --- windows, canopies, PMMA
[NPL-DMA(A)113] p 665 N86-28193

**CARBON FIBER REINFORCED PLASTICS**
Carbon fibres and their composites
p 661 A86-40487
Technical status and future prospects of carbon fibres and their application in composites with polymer matrix (CFRPs) p 661 A86-40488
Autoclave, compression moulding p 668 A86-40495
Experiences in FRG in aerospace application --- of carbon fiber reinforced plastics p 661 A86-40498
Experiences in UK and France in aerospace application --- of glass and carbon fiber reinforced composites
p 621 A86-40499
Thermoplastic composites - Design material of the 1990s? p 663 A86-41685
Design of a carbon-fiber reinforced wing for the Alpha-Jet major panel tests p 638 A86-41692

**CARBON-CARBON COMPOSITES**
Carbon-carbon composites for braking
p 661 A86-40364
Application of medical computed tomography (CT) scanners to advanced aerospace composites
p 670 A86-41631

**CARGO**
General designer Balabuyev on An-124 Ruslan features p 623 N86-28910
**CARGO AIRCRAFT**
General designer Balabuyev on An-124 Ruslan features p 623 N86-28910
**CASCADE FLOW**
Particle trajectories in full 3D flow field of turbomachinery p 669 A86-40734
Computation of two-dimensional transonic cascade flow using a new Navier-Stokes solver
[AIAA PAPER 86-1381] p 624 A86-42605
A comparison of computational methods for three-dimensional, turbulent turbomachinery flow fields
[AIAA PAPER 86-1599] p 626 A86-42740
**CASTINGS**
Advanced rotary engine components utilizing fiber reinforced Mg castings
[AIAA PAPER 86-1559] p 663 A86-42712
**CENTRAL PROCESSING UNITS**
NASA supercomputer system to become available nationally
[NASA-NEWS-RELEASE-86-82] p 681 N86-28628
**CENTRIFUGAL COMPRESSORS**
Dilute gas-particle flow in a centrifugal compressor impeller p 668 A86-40733
**CHANNELS (DATA TRANSMISSION)**
Optical technology for flight control systems
[NASA-TM-88400] p 655 N86-28960
Interface of the transport systems research vehicle monochrome display system to the digital autonomous terminal access communication data bus
[NASA-TM-87728] p 656 N86-28961
**CHARACTERIZATION**
Characterisation and influence of orientation and internal stress in acrylic aircraft materials --- windows, canopies, PMMA
[NPL-DMA(A)113] p 665 N86-28193
**CHEMICAL ANALYSIS**
Chemical control for Airbus composites. HPLC standardization
[I-104/84] p 664 N86-28133
**CHEMICAL COMPOSITION**
Development of a portable wear metal analyzer for field use
[AD-A166013] p 622 N86-28906
**CHEMICAL REACTIONS**
A detailed numerical model of a supersonic reacting mixing layer
[AIAA PAPER 86-1427] p 671 A86-42636
**CHIPS (ELECTRONICS)**
The impact of very high performance integrated circuits on avionics system readiness p 674 N86-28373
**CIRCUIT PROTECTION**
Protecting electronics against lightning gets harder p 633 A86-41034
**CIVIL AVIATION**
Integrated navigation, communication, and surveillance systems based on standard distance measuring equipment p 635 A86-40116
Regulation by the Civil Aviation Authority of air safety in the United Kingdom p 633 A86-40565
Policing aviation safety in the Netherlands p 633 A86-40567
From a strike to a kill p 634 A86-42423
Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue number 10 of 1984 accidents
[PB86-916906] p 634 N86-28070
USSR report: Transportation
[JPRS-UTR-86-007] p 622 N86-28908
Aeroflot officials roundtable on section's technical progress p 623 N86-28909
Development of an operating profile for aircraft tires
[FAA/CT-85-32] p 677 N86-29218
**CLEARANCES**
Improved compressor performance using recessed clearance (trenches) over the rotor
[AIAA PAPER 86-1745] p 649 A86-42623
**CLOUDS (METEOROLOGY)**
The calculation of the entropy distribution along cloud traverses using aircraft measurements p 678 A86-40555
Sampling of solid particles in clouds p 668 A86-40720
**CLUTCHES**
Multifunctional requirements for a gearbox secondary power system in a modern fighter aircraft and its components and interface requirements p 678 N86-29243
**CLUTTER**
Weibull-distributed ground clutter in the frequency domain p 671 A86-41883
**COAXIAL FLOW**
Flight effects on noise from coaxial dual flow. II - Heated jets p 644 A86-41706
**COAXIAL NOZZLES**
Multiaxis aircraft control power from thrust vectoring at high angles of attack
[NASA-TM-87741] p 629 N86-28054
**COCKPIT SIMULATORS**
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177408] p 636 N86-28931
**COCKPITS**
Control systems for the Airbus design and functional experience --- cockpits
[ESA-86-96936] p 653 N86-28094
Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage
[DOT/FAA/PM-86/25,1] p 642 N86-28944
Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29508
**COEFFICIENTS**
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft
[NASA-TM-87706] p 675 N86-28385
**COLD FLOW TESTS**
Large eddy simulations of flow in a ramjet combustor p 659 N86-28241
**COLD WORKING**
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes p 662 A86-40575
**COLLISION AVOIDANCE**
A comparison of the effects of two traffic alert and collision avoidance systems (TCAS 3 and TCAS 2) on the performance of the Air Traffic Control Radar Beacon System
[DOT/FAA/PM-86/8] p 636 N86-28930
**COMBAT**
Computer sizing of fighter aircraft
[AIAA PAPER 85-0212] p 637 A86-40106
An analysis of a four state model for pursuit-evasion games --- during air combat p 660 A86-42957
**COMBUSTIBLE FLOW**
A detailed numerical model of a supersonic reacting mixing layer
[AIAA PAPER 86-1427] p 671 A86-42636
Interactions between acoustics and vortex structures in a central dump combustor
[AIAA PAPER 86-1609] p 671 A86-42749
**COMBUSTION CHAMBERS**
Altitude ignition/lean deceleration study
[AIAA PAPER 86-1530] p 646 A86-42694
Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models
[AIAA PAPER 86-1595] p 647 A86-42737
Modeling the combustion zone of gas-turbine-engine combustion chambers p 650 A86-43393
Small film-evaporation type combustion chamber for a low-power gas turbine engine p 650 A86-43395
The flowfield of a side-dump combustor p 673 N86-28237
Flame driving of longitudinal instabilities in dump type ramjet combustors p 658 N86-28239
Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240
Large eddy simulations of flow in a ramjet combustor p 659 N86-28241
Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242
Prediction of the stability performance of a turboreactor combustion chamber
[SNECMA-YKC-3269/85] p 651 N86-28949
**COMBUSTION CHEMISTRY**
Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610
**COMBUSTION CONTROL**
A novel feedback concept for combustion instability in ramjets p 665 N86-28236
**COMBUSTION EFFICIENCY**
Prediction of the stability performance of a turboreactor combustion chamber
[SNECMA-YKC-3269/85] p 651 N86-28949
**COMBUSTION PHYSICS**
Modeling the combustion zone of gas-turbine-engine combustion chambers p 650 A86-43393
**COMBUSTION STABILITY**
A novel feedback concept for combustion instability in ramjets p 665 N86-28236
Flame driving of longitudinal instabilities in dump type ramjet combustors p 658 N86-28239
Prediction of the stability performance of a turboreactor combustion chamber
[SNECMA-YKC-3269/85] p 651 N86-28949
**COMMAND AND CONTROL**
Eigenvalues assignment method: An application to designing an autopilot
[SNIAS-861-111-106] p 653 N86-28095
**COMMERCIAL AIRCRAFT**
A computer-augmented procedure for commercial aircraft configuration development and optimization p 637 A86-40114
The market price for air safety p 633 A86-40228
Overview --- of new metallic and nonmetallic aircraft materials p 659 A86-40252
Beech's enterprising Starship p 637 A86-40471
Which transport technologies will fly? p 621 A86-41037
Aeroflot officials roundtable on section's technical progress p 623 N86-28909
Annual review of aircraft accident data. US air carrier operations: Calendar year 1982
[PB86-212529] p 634 N86-28929
**COMMUNICATION EQUIPMENT**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29110
**COMPOSITE MATERIALS**
Failure analysis of composite angle structures p 667 A86-40353
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361
Carbon fibres and their composites p 661 A86-40467
Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984 p 662 A86-41051
Composite repair techniques examined p 662 A86-41684
**COMPOSITE STRUCTURES**
Autoclave, compression moulding p 668 A86-40495
Composite repair at the Naval Air Rework Facility, North Island --- composite aircraft structures
[AIAA PAPER 86-1140] p 664 A86-43329
The design of composite structures --- aircraft design
[SNIAS-861-111-103] p 640 N86-28082
Light weight fire resistant graphite composites
[NASA-CLASS-ARC-11615-1SB] p 664 N86-28131
Multivariable control of a forward swept wing aircraft
[NASA-CR-177112] p 654 N86-28953
Boundary layer model to compute the edge effects in stratified composite plates
[ONERA-RT-7/3542-RY-041-R] p 678 N86-29279
**COMPRESSED AIR**
Compressors study: Improving the efficiency of a high performance multistage compressor
[ESA-86-97192] p 651 N86-28948
**COMPRESSIBLE FLOW**
A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751
Correlation of theory and experiment for propfan inlets
[AIAA PAPER 86-1628] p 627 A86-42761
**COMPRESSING**
Autoclave, compression moulding p 668 A86-40495
**COMPRESSOR BLADES**
A method for the analytical determination of accelerated test schedules for compressor blades working in a corrosive medium p 673 A86-43411
**COMPRESSOR EFFICIENCY**
Improved compressor performance using recessed clearance (trenches) over the rotor
[AIAA PAPER 86-1745] p 649 A86-42623
Compressors study: Improving the efficiency of a high performance multistage compressor
[ESA-86-97192] p 651 N86-28948
**COMPRESSOR ROTORS**
Axial-flow fan stalling behavior with circumferential inlet sectoring
[AIAA PAPER 86-1622] p 626 A86-42756
Multi-stage compressor airfoil aerodynamics. I - Airfoil potential flow analysis
[AIAA PAPER 86-1744] p 627 A86-42822
Calculation of the balancing efficiency of flexible rotors of compressor units on low-cycle balancing machines p 673 A86-43379
**COMPUTATION**
Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model
[NASA-TM-88442] p 657 N86-28964
**COMPUTATIONAL FLUID DYNAMICS**
Airfoil optimization p 623 A86-40107
Viscous effects on transonic airfoil stability and response p 623 A86-40110
Unsteady transonic flow calculations for interfering lifting surface configurations p 623 A86-40118
Large and small structures in the computation of transition to fully developed turbulent flows p 669 A86-41254

Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261

Application of a supersonic Euler code (SWINT) to wing-body-tail geometries p 624 A86-41697

Numerical study of the trailing edge region in slip flow regime p 624 A86-42548

Computation of two-dimensional transonic cascade flow using a new Navier-Stokes solver
[AIAA PAPER 86-1381] p 624 A86-42605

A computational fluid dynamics evaluation of test cell recirculation effects on high-bypass turbofan engine surface pressure distributions
[AIAA PAPER 86-1384] p 655 A86-42606

Calculation of annular nozzle trisonic flowfields by the method of characteristics
[AIAA PAPER 86-1519] p 625 A86-42686

An LU implicit scheme for high speed inlet analysis
[AIAA PAPER 86-1520] p 625 A86-42687

Improved Euler analysis of advanced turboprop propeller flows
[AIAA PAPER 86-1521] p 625 A86-42688

Simulation of engine installation flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-1537] p 671 A86-42699

Numerical Navier-Stokes solutions of high speed propeller flows
[AIAA PAPER 86-1538] p 626 A86-42700

Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models
[AIAA PAPER 86-1595] p 647 A86-42737

A comparison of computational methods for three-dimensional, turbulent turbomachinery flow fields
[AIAA PAPER 86-1599] p 626 A86-42740

Interactions between acoustics and vortex structures in a central dump combustor
[AIAA PAPER 86-1609] p 671 A86-42749

A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751

A numerical analysis applied to high angle of attack three-dimensional inlets
[AIAA PAPER 86-1527] p 627 A86-42760

Collocation for an integral equation arising in duct acoustics p 682 A86-43038

Geometry definition and grid generation for a complete fighter aircraft
[NASA-TM-88242] p 622 N86-28050

A perspective of computational fluid dynamics
[NASA-TM-88246] p 629 N86-28057

Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060

Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88228] p 630 N86-28062

Computation of the transonic flow about a swept wing in the presence of an engine nacelle
[NASA-CR-177113] p 630 N86-28911

A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919

**COMPUTATIONAL GRIDS**

Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261

Geometry definition and grid generation for a complete fighter aircraft
[NASA-TM-88242] p 622 N86-28050

A perspective of computational fluid dynamics
[NASA-TM-88246] p 629 N86-28057

Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88228] p 630 N86-28062

**COMPUTER AIDED DESIGN**

A computer-augmented procedure for commercial aircraft configuration development and optimization
p 637 A86-40114

Computer aided control system design using a multiobjective optimization approach
p 679 A86-40760

An expert system for control system design
p 680 A86-40774

Application of a computer model to electric current perturbation probe design p 669 A86-41576

Development of 'CADEGA' CAD system for aero engine design p 645 A86-42425

Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models
[AIAA PAPER 86-1595] p 647 A86-42737

The OASIS structural optimization system
p 672 A86-43090

Layout of electrical equipment on an aircraft with allowance for equipment size constraints in the framework of computer-aided design p 639 A86-43389

The SIGMA cadcam software
[SNIAS-861-111-110] p 640 N86-28083

Computing codes for development of helicopter crashworthy structures and test substantiation
[SNIAS-861-210-106] p 640 N86-28084

The use of mathematical optimization techniques by the designer
[NLR-MP-85005-U] p 682 N86-28673

**COMPUTER AIDED MANUFACTURING**

The SIGMA cadcam software
[SNIAS-861-111-110] p 640 N86-28083

**COMPUTER AIDED TOMOGRAPHY**

Application of medical computed tomography (CT) scanners to advanced aerospace composites
p 670 A86-41631

**COMPUTER GRAPHICS**

Geometry definition and grid generation for a complete fighter aircraft
[NASA-TM-88242] p 622 N86-28050

**COMPUTER PROGRAM INTEGRITY**

An experiment in software reliability
[NASA-CR-172553] p 682 N86-29547

**COMPUTER PROGRAMMING**

An experiment in software reliability
[NASA-CR-172553] p 682 N86-29547

**COMPUTER PROGRAMS**

Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052

NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076

Processing and meteorological evaluation of research flights with DFVLR motor gliders using the software package RAMF
[DFVLR-FB-85-57] p 678 N86-28586

The use of a panel code on high lift configurations of a swept forward wing
[NASA-CR-176968] p 631 N86-28916

Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors
[NASA-TM-88998] p 637 N86-28933

In-flight thrust determination on a real-time basis
[NASA-CR-176997] p 641 N86-28937

**COMPUTER SYSTEMS PROGRAMS**

The SIGMA cadcam software
[SNIAS-861-111-110] p 640 N86-28083

Computing codes for development of helicopter crashworthy structures and test substantiation
[SNIAS-861-210-106] p 640 N86-28084

Processing and meteorological evaluation of research flights with DFVLR motor gliders using the software package RAMF
[DFVLR-FB-85-57] p 678 N86-28586

**COMPUTER TECHNIQUES**

Computer sizing of fighter aircraft
[AIAA PAPER 85-0212] p 637 A86-40106

Computerisation of air information services in France
p 635 A86-40229

Software position and velocity limiting for a synergistic six degree-of-freedom motion system --- flight simulators
p 655 A86-42170

A fault-tolerant 1750A engine controller
[AIAA PAPER 86-1675] p 648 A86-42786

**COMPUTERIZED SIMULATION**

Computer sizing of fighter aircraft
[AIAA PAPER 85-0212] p 637 A86-40106

Advanced turbine engine simulation technique development and applications to testing
[AIAA PAPER 86-1731] p 649 A86-42818

Modeling the combustion zone of gas-turbine-engine combustion chambers p 650 A86-43393

A perspective of computational fluid dynamics
[NASA-TM-88246] p 629 N86-28057

Siting criteria for Microwave Landing Systems (MLS)
[FAA/PM-86/18] p 636 N86-28073

Large eddy simulations of flow in a ramjet combustor
p 659 N86-28241

Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242

NASA supercomputer system to become available nationally
[NASA-NEWS-RELEASE-86-92] p 681 N86-28626

Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917

Extension of a transonic three dimensional unsteady small perturbation computing method
[ONERA-RTS-23/3064-RY-048-R] p 633 N86-28927

Interaction of airborne and structureborne noise radiated by plates. Volume 1: Analytical study
[NASA-TM-87746] p 683 N86-29633

**COMPUTERS**

Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29508

**CONCENTRATION (COMPOSITION)**

Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610

**CONFERENCES**

Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford University, England, July 8-11, 1985 p 659 A86-40251

Carbon fibres and their composites
p 661 A86-40487

Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 p 642 A86-40726

Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984 p 662 A86-41051

Protective coating systems for high-temperature gas turbine components; Proceedings of the Conference, London, England, November 13, 14, 1984
p 664 A86-43134

Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236

**CONICAL BODIES**

Measured and predicted heating distributions for biconics at Mach 10 p 624 A86-41734

**CONSTITUTIVE EQUATIONS**

The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344

**CONTRAROTATING PROPELLERS**

Turbofan and propfan as basis for future economic propulsion concepts
[AIAA PAPER 86-1474] p 645 A86-42862

**CONTROL EQUIPMENT**

A fault-tolerant 1750A engine controller
[AIAA PAPER 86-1675] p 648 A86-42786

Identification of frequency characteristics during bench tests p 681 A86-43387

**CONTROL STABILITY**

New applications of mu to real-parameter variation problems --- structured singular value theory for flight control systems stability analysis p 680 A86-42871

**CONTROL SURFACES**

The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767

**CONTROL SYSTEMS DESIGN**

Computer aided control system design using a multiobjective optimization approach
p 679 A86-40760

The design and implementation of multivariable variable structure control systems p 679 A86-40762

The design of a sliding mode controller for dutch roll damping in a non-linear aircraft system
p 651 A86-40766

The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767

On the relationship between robustness tests and their application to helicopter control system designs
p 652 A86-40771

An expert system for control system design
p 680 A86-40774

Two approaches to hyperplane design in multivariable variable structure control systems p 680 A86-41934

A design approach to a performance seeking control --- for fighter aircraft engines
[AIAA PAPER 86-1674] p 652 A86-42785

Eigenstructure assignment, eigensensitivity, and flight control design p 680 A86-42912

Eigenstructure synthesis of an oblique wing flight control system p 652 A86-42913

Design issues for fault tolerant-restructurable aircraft control p 652 A86-42937

Integrated control - A decentralized approach
p 681 A86-42996

Control systems for the Airbus design and functional experience — cockpits
[ESA-86-96936] p 653 N86-28094

Eigenvalues assignment method: An application to designing an autopilot
[SNIAS-861-111-106] p 653 N86-28095

Multi-input, multi-output system control for experimental aircraft
[NASA-CR-177017] p 654 N86-28955

Optimal cooperative control synthesis of active displays
[NASA-177102] p 683 N86-29651

**CONTROL THEORY**

New applications of mu to real-parameter variation problems --- structured singular value theory for flight control systems stability analysis p 680 A86-42871

A differential dynamic programming method with an abrupt penalty integrand for solving tolerance problems
p 680 A86-42877

A covariance control theory p 680 A86-42899

Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950

**CONTROLLABILITY**
A covariance control theory p 680 A86-42899
The integrated manual and automatic control of complex flight systems
[NASA-CR-177086] p 654 N86-28952

**CONTROLLERS**
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049

**CONVECTIVE HEAT TRANSFER**
Clearance effects on heat transfer at the tips of plain and grooved turbine airfoils p 644 A86-40737

**CONVERGENT-DIVERGENT NOZZLES**
Initial performance evaluation of 2DCD ejector exhaust systems --- two dimensional convergent-divergent
[AIAA PAPER 86-1615] p 626 A86-42753
Multiaxis aircraft control power from thrust vectoring at high angles of attack
[NASA-TM-87741] p 629 N86-28054

**CORRELATION**
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085

**CORROSION PREVENTION**
The future of surface treatments in aeronautical construction
[SNIAS-861-551-101] p 665 N86-29037

**CORROSION RESISTANCE**
Influence of molybdenum, tungsten, and cobalt on the corrosion of high-temperature strength nickel alloys in molten salts p 663 A86-41988

**CORROSION TESTS**
Comparison of corrosion behaviour of lithium-containing aluminium alloys and conventional aerospace alloys
p 660 A86-40280
A method for the analytical determination of accelerated test schedules for compressor blades working in a corrosive medium p 673 A86-43411

**COUNTER ROTATION**
Counter-rotation prop-fan optimization
[AIAA PAPER 86-1470] p 645 A86-42659

**COUNTERFLOW**
Application of laser-dual-focus velocimetry in a counterflow p 628 A86-43110

**COVARIANCE**
A covariance control theory p 680 A86-42899

**CRACK GEOMETRY**
Probability of detection of flaws in a gas turbine engine component using electric current perturbation
p 669 A86-41574

**CRACK PROPAGATION**
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes
p 662 A86-40575
Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria
[DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29028

**CRACKING (FRACTURING)**
Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria
[DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

**CRACKS**
Aero-engine gears: Manufacturing cracks and their effect on operation p 677 N86-29239

**CRANES**
The Cyclo-Crane - A hybrid airship concept
p 638 A86-41976

**CRASHWORTHINESS**
Response of composite material shallow arch to concentrated load p 670 A86-41699
Computing codes for development of helicopter crashworthy structures and test substantiation
[SNIAS-861-210-106] p 640 N86-28084

**CRAY COMPUTERS**
NASA supercomputer system to become available nationally
[NASA-NEWS-RELEASE-86-92] p 681 N86-29628

**CREEP PROPERTIES**
Constitutive modeling of cyclic plasticity and creep, using an internal time concept p 670 A86-41673

**CRITICAL LOADING**
Optimal design of antisymmetric laminated composite plates p 667 A86-40109

**CROSS FLOW**
Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922

**CRUISE MISSILES**
Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems
[AIAA PAPER 86-1545] p 636 A86-42704

**CRYOGENIC WIND TUNNELS**
Cryogenic wind tunnels: Problems of continuous operation at low temperatures
[NASA-TM-88446] p 656 N86-28099
Improvement in the quality of flow visualization in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87730] p 675 N86-28369

**CRYOGENICS**
Development of a reusable, flight-weight cryogenic foam insulation system
[AIAA PAPER 86-1189] p 658 A86-40612

**CRYSTAL STRUCTURE**
New alloys from the quantum engineer
p 663 A86-42424

**CRYSTALLOGRAPHY**
Textures developed in Al-Li-Cu-Mg alloy
p 660 A86-40291

**CURVED BEAMS**
Failure analysis of composite angle structures
p 667 A86-40353

**CYCLIC LOADS**
Turbine airfoil LCF life prediction verification
[AIAA PAPER 86-1496] p 646 A86-42672

**CYLINDRICAL SHELLS**
Response of composite material shallow arch to concentrated load p 670 A86-41699

## D

**DAMAGE ASSESSMENT**
Damage tolerance assessment of aircraft attachment lugs p 672 A86-43084

**DATA BASES**
Computerisation of air information services in France
p 635 A86-40229

**DATA TRANSMISSION**
Possible impacts of VHSIC on MIL-STD-1553B data transmission management p 674 N86-28371

**DC 8 AIRCRAFT**
Design features for performance retention in the CFM56 engine p 643 A86-40729

**DECISION MAKING**
Time-based air traffic management using expert systems
[NASA-TM-88234] p 634 N86-28068
The impact of artificial intelligence on airborne maritime reconnaissance p 675 N86-28374

**DECISION THEORY**
Failure detection and accommodation in structural dynamics systems using analytic redundancy --- in large space structures p 658 A86-42936

**DEFENSE PROGRAM**
Mastering the transatmosphere p 658 A86-41274

**DEFLECTION**
NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076

**DEFORMATION**
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080

**DELAMINATING**
Boundary layer model to compute the edge effects in stratified composite plates
[ONERA-RT-7/3542-RY-041-R] p 676 N86-29279

**DELTA WINGS**
Ground effect on slender wings at moderate and high angles of attack p 623 A86-40108
Indicial coefficients for a cropped delta wing in incompressible flow p 623 A86-40111
Analytical observations on the aerodynamics of a delta wing with leading edge flaps
[NASA-CR-177022] p 630 N86-28913
The lift of sharp-leading-edged delta wings with blowing
[NASA-CR-176967] p 631 N86-28915
A theory for lateral wing-tip blowing
[NASA-CR-176931] p 632 N86-28923
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176908] p 676 N86-29159

**DENSITY DISTRIBUTION**
Application of medical computed tomography (CT) scanners to advanced aerospace composites
p 670 A86-41631

**DESCENT**
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939

**DESIGN ANALYSIS**
Which transport technologies will fly?
p 621 A86-41037
Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984 p 662 A86-41051
Transfer of alignment and calibration of multiple sensors in flexible systems p 681 A86-43003
Future Aeronautical Communication System (FACS): Report
[ESA-86-98959] p 673 N86-28309
The use of mathematical optimization techniques by the designer
[NLR-MP-85065-U] p 662 N86-28673
Design and calculation of high speed engine bearings
p 677 N86-29241

**DESORPTION**
Effect of moisture on thermal properties of composite materials for aerospace applications
p 661 A86-40345
New vistas in the determination of hydrogen in aerospace engine metal alloys
[AIAA PAPER 86-1479] p 663 A86-42665

**DETERIORATION**
Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 p 642 A86-40726
Factors relating to deterioration based on Rolls-Royce RB 211 in service performance p 643 A86-40730
Study of single stage axial flow compressor performance deterioration p 643 A86-40735
Performance deterioration during rotating stall in axial compressors p 644 A86-40738

**DETONABLE GAS MIXTURES**
Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610

**DIAGNOSIS**
Knowledge-based systems for rotordynamic diagnostics
[AIAA PAPER 86-1678] p 648 A86-42789
An overview of USAF engine diagnostic systems
[AIAA PAPER 86-1679] p 649 A86-42790

**DIFFERENTIAL EQUATIONS**
A differential dynamic programming method with an abrupt penalty integrand for solving tolerance problems
p 680 A86-42877

**DIFFUSERS**
Effects of S-bends on diffuser internal performance and turbulence characteristics
[AIAA PAPER 86-1459] p 625 A86-42654
S-duct inlet/diffusers for turboprop offset gearbox applications
[AIAA PAPER 86-1462] p 625 A86-42655

**DIFFUSION**
A simplified model of the turbulent microburst
[NASA-CP-177106] p 679 N86-2[illegible]466

**DIGITAL COMPUTERS**
Optical technology for flight control systems
[NASA-TM-88400] p 655 N86-2[illegible]980

**DIGITAL SIMULATION**
Digital simulation of regulated electrical power supplies for military applications p 669 A86-40775

**DIGITAL SYSTEMS**
Test and evaluation of the HIDEC engine uptrim algorithm --- Highly Integrated Digital Electronic Control for aircraft
[AIAA PAPER 86-1676] p 648 A86-42787
Test and evaluation of the HIDEC engine uptrim algorithm
[NASA-TM-88262] p 650 N86-28088
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data
[NASA-TM-87632-PT-2] p 653 N86-28093
The future of bipolar technology for avionics
p 674 N86-28341
Investigation of an advanced fault tolerant integrated avionics system
[NASA-CR-176980] p 642 N86-28945
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950

**DIGITAL TECHNIQUES**
Mil-DAP: Its architecture and role as a real time airborne digital signal processor p 681 N86-28359
Interface of the transport systems research vehicle monochrome display system to the digital autonomous terminal access communication data bus
[NASA-TM-87728] p 656 N86-28961

**DIRECTIONAL CONTROL**

Multiaxis aircraft control power from thrust vectoring at high angles of attack [NASA-TM-87741] p 629 N86-28054

**DISPLACEMENT**

Response of composite material shallow arch to concentrated load p 670 A86-41699

Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782

A large displacement formulation for anisotropic beam analysis p 671 A86-42075

**DISPLAY DEVICES**

The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372

Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage [DOT/FAA/PM-86/25,1] p 642 N86-28944

Interface of the transport systems research vehicle monochrome display system to the digital autonomous terminal access communication data bus [NASA-TM-87728] p 656 N86-28961

Optimal cooperative control synthesis of active displays [NASA-177102] p 683 N86-29651

**DISTANCE MEASURING EQUIPMENT**

Integrated navigation, communication, and surveillance systems based on standard distance measuring equipment p 635 A86-40116

**DOCUMENTATION**

NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems [NASA-CR-174967] p 675 N86-28463

**DOPPLER RADAR**

Taming the killer wind shear p 678 A86-41035

**DRAG REDUCTION**

Aerodynamic investigations toward an adaptive airfoil for a transonic transport aircraft p 623 A86-40115

An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction [NASA-CR-177133] p 630 N86-2806

Feasibility of generating an artificial burst in a turbulent boundary layer [NASA-CR-4003] p 675 N86-28377

**DUAL WING CONFIGURATIONS**

Dual-wing systems with decalage angle optimization p 624 A86-40121

**DUCTS**

S-duct inlet/diffusers for turboprop offset gearbox applications [AIAA PAPER 86-1462] p 625 A86-42655

**DYNAMIC LOADS**

Linear and nonlinear dynamic analysis of redundant load path bearingless rotor systems [NASA-CR-177098] p 682 N86-29579

**DYNAMIC PROGRAMMING**

A differential dynamic programming method with an abrupt penalty integrand for solving tolerance problems p 680 A86-42877

**DYNAMIC RESPONSE**

Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft [NASA-CR-176977] p 631 N86-28917

An introductory course on aircraft loading [NLR-MP-84090-U] p 641 N86-28943

**DYNAMIC STRUCTURAL ANALYSIS**

Failure detection and accommodation in structural dynamics systems using analytic redundancy --- in large space structures p 658 A86-42938

Linear and nonlinear dynamic analysis of redundant load path bearingless rotor systems [NASA-CR-177098] p 682 N86-29579

**DYNAMICAL SYSTEMS**

Two approaches to hyperplane design in multivariable variable structure control systems p 680 A86-41934

## E

**EDDY CURRENTS**

Automatic eddy current inspection of antirotation windows in F100 engine compressor air seals p 669 A86-41581

Automatic eddy current hole centering for aircraft engine components p 670 A86-41582

**EDGE LOADING**

Boundary layer model to compute the edge effects in stratified composite plates [ONERA-RT-7/3542-RY-041-R] p 678 N86-29279

**EDUCATION**

Propulsion education at the Air Force Institute of Technology [AIAA PAPER 86-1754] p 684 A86-42827

**EIGENVALUES**

Eigenvalue reanalysis of locally modified structures using a generalized Rayleigh's method [AIAA PAPER 84-0972] p 670 A86-41714

Eigenstructure assignment, eigensensitivity, and flight control design p 680 A86-42912

Eigenstructure synthesis of an oblique wing flight control system p 652 A86-42913

Eigenvalues assignment method: An application to designing an autopilot [SNIAS-861-111-106] p 653 N86-28095

**EIGENVECTORS**

Eigenstructure synthesis of an oblique wing flight control system p 652 A86-42913

**EJECTION SEATS**

Naces - Today's ultimate seat p 637 A86-40472

**EJECTORS**

Initial performance evaluation of 2DCD ejector exhaust systems --- two dimensional convergent-divergent [AIAA PAPER 86-1615] p 626 A86-42753

**ELASTIC ANISOTROPY**

A large displacement formulation for anisotropic beam analysis p 671 A86-42075

**ELASTIC SHELLS**

The influence of source location on the structural-acoustic interaction of cylinders --- in aerodynamics p 638 A86-41710

**ELECTRIC CURRENT**

Probability of detection of flaws in a gas turbine engine component using electric current perturbation p 669 A86-41574

Application of a computer model to electric current perturbation probe design p 669 A86-41576

**ELECTRIC EQUIPMENT**

Layout of electrical equipment on an aircraft with allowance for equipment size constraints in the framework of computer-aided design p 639 A86-43389

**ELECTRICAL MEASUREMENT**

Probability of detection of flaws in a gas turbine engine component using electric current perturbation p 669 A86-41574

Application of a computer model to electric current perturbation probe design p 669 A86-41576

**ELECTROMECHANICAL DEVICES**

Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys [PB86-184314] p 665 N86-28186

**ELECTRONIC CONTROL**

Test and evaluation of the HIDEC engine uptrim algorithm --- Highly Integrated Digital Electronic Control for aircraft [AIAA PAPER 86-1676] p 648 A86-42787

Test and evaluation of the HIDEC engine uptrim algorithm [NASA-TM-88262] p 650 N86-28088

**ELECTRONIC EQUIPMENT**

Developing a maintenance concept for future electronic systems [AIAA PAPER 86-1145] p 684 A86-43333

Effect of time delay on flying qualities: An update [NASA-TM-88264] p 653 N86-28092

Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys [PB86-184314] p 665 N86-28186

**ELECTRONIC PACKAGING**

The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372

**ELECTROPLATING**

The future of surface treatments in aeronautical construction [SNIAS-861-551-101] p 665 N86-29037

**ENERGY ABSORPTION**

Aircraft barricade [AD-D012194] p 656 N86-28102

**ENERGY CONSERVATION**

Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft [NASA-CR-159251] p 639 N86-28077

Design requirements and development of an airborne descent path definition algorithm for time navigation [NASA-CR-178037] p 641 N86-28939

An investigation of TNAV equipped aircraft in a simulated en route metering environment [NASA-CR-178031] p 641 N86-28940

**ENGINE AIRFRAME INTEGRATION**

Simulation of engine installation flowfields using a three-dimensional Euler/Navier-Stokes algorithm [AIAA PAPER 86-1537] p 671 A86-42699

Evaluation of propeller/nacelle interactions in the PTA program [AIAA PAPER 86-1552] p 626 A86-42709

Test and evaluation of the HIDEC engine uptrim algorithm [NASA-TM-88262] p 650 N86-28088

**ENGINE ANALYZERS**

Knowledge-based systems for rotordynamic diagnostics [AIAA PAPER 86-1678] p 648 A86-42789

**ENGINE CONTROL**

A fault-tolerant 1750A engine controller [AIAA PAPER 86-1675] p 648 A86-42786

Test and evaluation of the HIDEC engine uptrim algorithm --- Highly Integrated Digital Electronic Control for aircraft [AIAA PAPER 86-1676] p 648 A86-42787

Integrated control - A decentralized approach p 681 A86-42996

The development of a model for the unstable operation of a turbocompressor and the design of a device to protect a gas turbine engine against stalling and surging p 650 A86-43390

**ENGINE COOLANTS**

Performance estimation of the mixed flow, afterburning, cooled, two-spool turbofan engine with bleed and power extraction [AIAA PAPER 86-1757] p 649 A86-42830

Generalization of experimental data on the internal hydraulic resistance of laminated porous materials p 650 A86-43383

**ENGINE DESIGN**

A new generation T56 turboprop engine p 642 A86-40133

Design features for performance retention in the CFM56 engine p 643 A86-40729

Effect of engine technology on advanced fighter design and cost p 644 A86-41691

After the big turbofans p 645 A86-42099

Development of 'CADEGA' CAD system for aero engine design p 645 A86-42425

Turboprop and open rotor propulsion for the future [AIAA PAPER 86-1472] p 645 A86-42660

UHB technology flight validation program --- Ultra High Bypass engines for large passenger aircraft [AIAA PAPER 86-1473] p 656 A86-42661

Rotorcraft propulsion for year 2000 plus [AIAA PAPER 86-1543] p 646 A86-42702

Small engine technology payoffs for future commuter aircraft [AIAA PAPER 86-1544] p 646 A86-42703

Small turboshaft/turboprop engine technology study [AIAA PAPER 86-1623] p 647 A86-42757

Small engine propulsion readiness for the 21st century [AIAA PAPER 86-1624] p 647 A86-42758

Design for engine supportability [AIAA PAPER 86-1671] p 648 A86-42784

Advances in aero engine dynamics [AIAA PAPER 86-1677] p 648 A86-42788

Solid fuel gas generator air --- Air TurboRamjet [AIAA PAPER 86-1682] p 649 A86-42792

Advanced turbine engine simulation technique development and applications to testing [AIAA PAPER 86-1731] p 649 A86-42818

Theoretical and experimental investigation of test cell aerodynamics for turbofan applications [AIAA PAPER 86-1732] p 656 A86-42819

Using Derivative engine technology to achieve maturity goals [AIAA PAPER 86-1752] p 649 A86-42826

Performance estimation of the mixed flow, afterburning, cooled, two-spool turbofan engine with bleed and power extraction [AIAA PAPER 86-1757] p 649 A86-42830

A supersonic fan equipped variable cycle engine for a Mach 2.7 supersonic transport [NASA-CR-177141] p 650 N86-28946

Design and calculation of high speed engine bearings p 677 N86-29241

**ENGINE FAILURE**

Dynamic pressure loads associated with twin supersonic plume resonance [AIAA PAPER 86-1539] p 646 A86-42701

**ENGINE INLETS**

S-duct inlet/diffusers for turboprop offset gearbox applications [AIAA PAPER 86-1462] p 625 A86-42655

An LU implicit scheme for high speed inlet analysis [AIAA PAPER 86-1520] p 625 A86-42687

A numerical analysis applied to high angle of attack three-dimensional inlets [AIAA PAPER 86-1527] p 627 A86-42760

A turbine engine inlet viewing system [AIAA PAPER 86-1647] p 656 A86-42769

Test and evaluation of the HIDEC engine uptrim algorithm [NASA-TM-88262] p 650 N86-28088

**ENGINE MONITORING INSTRUMENTS**

Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232

An overview of USAF engine diagnostic systems [AIAA PAPER 86-1679] p 649 A86-42790

**ENGINE NOISE**
Collocation for an integral equation arising in duct acoustics p 682 A86-43038
**ENGINE PARTS**
Substantiation of regimes for accelerated equivalent tests of gas-turbine aeroengines p 644 A86-41549
Application of a computer model to electric current perturbation probe design p 669 A86-41576
Automatic eddy current inspection of antirotation windows in F100 engine compressor air seals p 669 A86-41581
Automatic eddy current hole centering for aircraft engine components p 670 A86-41582
Aero-engine gears: Manufacturing cracks and their effect on operation p 677 N86-29239
**ENGINE TESTING LABORATORIES**
A turbine engine inlet viewing system [AIAA PAPER 86-1647] p 656 A86-42769
**ENGINE TESTS**
Substantiation of regimes for accelerated equivalent tests of gas-turbine aeroengines p 644 A86-41549
Air turbine test results for three turbine stages with varying radial distribution of camber [AIAA PAPER 86-1467] p 645 A86-42657
A report on the initial testing of the large scale advanced prop-fan [AIAA PAPER 86-1551] p 647 A86-42708
Transient engine performance with water ingestion [AIAA PAPER 86-1621] p 647 A86-42755
Propfan test assessment (PTA) quick engine change (QEC) nacelle [AIAA PAPER 86-1626] p 648 A86-42759
Theoretical and experimental investigation of test cell aerodynamics for turbofan applications [AIAA PAPER 86-1732] p 656 A86-42819
Uniform engine testing program phase 7: NASA Lewis Research Center second entry [NASA-TM-87272] p 650 N86-28085
In-flight thrust determination on a real-time basis [NASA-CR-176997] p 641 N86-28937
**ENTROPY**
The calculation of the entropy distribution along cloud traverses using aircraft measurements p 678 A86-40555
**EPOXY MATRIX COMPOSITES**
Thermoplastic composites - Design material of the 1990s? p 663 A86-41685
**EQUATIONS OF MOTION**
Theory of the motion of propeller blades for large displacements p 639 A86-43385
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics [NASA-TM-86828] p 639 N86-28079
Computation of the transonic flow about a swept wing in the presence of an engine nacelle [NASA-CR-177113] p 630 N86-28911
Critical evaluation of the unsteady aerodynamics approach to dynamic stability at high angles of attack [NASA-CR-177104] p 632 N86-28924
**EROSION**
Compressor erosion and performance deterioration p 643 A86-40727
Study of single stage axial flow compressor performance deterioration p 643 A86-40735
**ERROR ANALYSIS**
Flightpath reconstruction and systematic radar error estimation from multi-radar range-azimuth measurements p 636 A86-42966
Application of parameter estimation to highly unstable aircraft [NASA-TM-88266] p 639 N86-28078
**ERROR CORRECTING DEVICES**
Elimination of directional wave spectrum contamination from noise in elevation measurements p 641 A86-40854
**ERROR DETECTION CODES**
Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors [NASA-TM-88998] p 637 N86-28933
**EULER EQUATIONS OF MOTION**
Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112
Improved Euler analysis of advanced turboprop propeller flows [AIAA PAPER 86-1521] p 625 A86-42688
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications [NASA-TM-88228] p 630 N86-28062
**EUROPEAN AIRBUS**
The design of composite structures --- aircraft design [SNIAS-861-111-103] p 640 N86-28082
Chemical control for Airbus composites. HPLC standardization [I-104/84] p 664 N86-28133
**EVALUATION**
Test and evaluation of the HIDEC engine uptrim algorithm [NASA-TM-88262] p 650 N86-28088
**EVAPORATORS**
Small film-evaporation type combustion chamber for a low-power gas turbine engine p 650 A86-43395
**EVASIVE ACTIONS**
An analysis of a four state model for pursuit-evasion games --- during air combat p 680 A86-42957
**EXHAUST FLOW SIMULATION**
Initial performance evaluation of 2DCD ejector exhaust systems --- two dimensional convergent-divergent [AIAA PAPER 86-1615] p 626 A86-42753
**EXHAUST NOZZLES**
Dynamic pressure loads associated with twin supersonic plume resonance [AIAA PAPER 86-1539] p 646 A86-42701
**EXPERT SYSTEMS**
An expert system for control system design p 680 A86-40774
Knowledge-based systems for rotordynamic diagnostics [AIAA PAPER 86-1678] p 648 A86-42789
Expert systems for aviation maintenance [AIAA PAPER 86-1143] p 622 A86-43332
Time-based air traffic management using expert systems [NASA-TM-88234] p 634 N86-28068

**F**

**F-106 AIRCRAFT**
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695
**F-15 AIRCRAFT**
Optimal cooperative control synthesis of active displays [NASA-177102] p 683 N86-29651
**FAILURE ANALYSIS**
Failure analysis of composite angle structures p 667 A86-40353
Knowledge-based systems for rotordynamic diagnostics [AIAA PAPER 86-1678] p 648 A86-42789
Failure detection and accommodation in structural dynamics systems using analytic redundancy --- in large space structures p 658 A86-42938
Initial design and evaluation of automatic restructurable flight control system concepts [NASA-CR-178064] p 652 N86-28090
**FASTENERS**
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes p 662 A86-40575
**FATIGUE (MATERIALS)**
Tribology in aircraft systems: Basic principles and applications p 677 N86-29240
**FATIGUE LIFE**
A new approach to durability prediction for fuel tank skins --- aircraft industry p 642 A86-40119
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes p 662 A86-40575
Development of an operating profile for aircraft tires [FAA/CT-85-32] p 677 N86-29218
Effects of unfavorable environmental conditions on the service life of jet engine and helicopter bearings p 677 N86-29238
**FATIGUE TESTS**
An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41596
**FAULT TOLERANCE**
A fault-tolerant 1750A engine controller [AIAA PAPER 86-1675] p 648 A86-42786
Design issues for fault tolerant-restructurable aircraft control p 652 A86-42937
Initial design and evaluation of automatic restructurable flight control system concepts [NASA-CR-178064] p 652 N86-28090
Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors [NASA-TM-88998] p 637 N86-28933
Investigation of an advanced fault tolerant integrated avionics system [NASA-CR-176980] p 642 N86-28945
An experiment in software reliability [NASA-CR-172553] p 682 N86-29547
**FEASIBILITY ANALYSIS**
Future Aeronautical Communication System (FACS): Report [ESA-86-96959] p 673 N86-28309
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft [NASA-TM-87706] p 675 N86-28385
**FEEDBACK CONTROL**
The design and implementation of multivariable variable structure control systems p 679 A86-40762
An expert system for control system design p 680 A86-40774
New applications of mu to real-parameter variation problems --- structured singular value theory for flight control systems stability analysis p 680 A86-42871
A covariance control theory p 680 A86-42899
Eigenstructure assignment, eigensensitivity, and flight control design p 680 A86-42912
Initial design and evaluation of automatic restructurable flight control system concepts [NASA-CR-178064] p 652 N86-28090
A novel feedback concept for combustion instability in ramjets p 665 N86-28236
Multivariable control systems with saturating actuators antireset windup strategies [NASA-CR-177100] p 682 N86-29580
**FEEDING (SUPPLYING)**
A study of optimizing cutting tool performance in high tensile strength materials p 666 A86-40527
**FIBER COMPOSITES**
Light weight fire resistant graphite composites [NASA-CLASS-ARC-11615-1SB] p 664 N86-28131
**FIBER OPTICS**
A fiber optic damage monitor p 670 A86-41605
Optical technology for flight control systems [NASA-TM-88400] p 655 N86-28960
Aeritalia: Avionics, optoelectronics research, ATR 42 p 642 N86-29080
**FIBER ORIENTATION**
Optimal design of antisymmetric laminated composite plates p 667 A86-40109
**FIBER REINFORCED COMPOSITES**
Optimal design of antisymmetric laminated composite plates p 667 A86-40109
Advanced rotary engine components utilizing fiber reinforced Mg castings [AIAA PAPER 86-1559] p 663 A86-42712
**FIBER STRENGTH**
Technical status and future prospects of carbon fibres and their application in composites with polymer matrix (CFRPs) p 661 A86-40488
**FIGHTER AIRCRAFT**
Computer sizing of fighter aircraft [AIAA PAPER 85-0212] p 637 A86-40106
Canard/tail comparison for an advanced variable-sweep-wing fighter p 637 A86-41688
Effect of engine technology on advanced fighter design and cost p 644 A86-41691
A supportability strategy for 1995 [AIAA PAPER 86-1670] p 684 A86-42783
Design for engine supportability [AIAA PAPER 86-1671] p 648 A86-42784
A design approach to a performance seeking control --- for fighter aircraft engines [AIAA PAPER 86-1674] p 652 A86-42785
Test and evaluation of the HIDEC engine uptrim algorithm --- Highly Integrated Digital Electronic Control for aircraft [AIAA PAPER 86-1676] p 648 A86-42787
Geometry definition and grid generation for a complete fighter aircraft [NASA-TM-88242] p 622 N86-28050
Multiaxis aircraft control power from thrust vectoring at high angles of attack [NASA-TM-87741] p 629 N86-28054
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985 [AD-A165846] p 640 N86-28080
Aerodynamics of the Viggen 37 aircraft. Part 1: General characteristics at low speed [NASA-TM-88403] p 632 N86-28925
Aircraft and Bearing Tribological Systems [AGARD-CP-394] p 677 N86-29236
Multifunctional requirements for a gearbox secondary power system in a modern fighter aircraft and its components and interface requirements p 678 N86-29243
**FILTERS**
Transfer of alignment and calibration of multiple sensors in flexible systems p 681 A86-43003
**FINITE DIFFERENCE THEORY**
Viscous effects on transonic airfoil stability and response p 623 A86-40110
**FINITE ELEMENT METHOD**
Failure analysis of composite angle structures p 667 A86-40353
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361
The OASIS structural optimization system p 672 A86-43090

Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers
[NASA-TM-87333] p 683 N86-29630

**FINITE VOLUME METHOD**
Design of transonic airfoils with given pressure, subject to geometric constraints
[NLR-TR-84064-U] p 633 N86-28926

**FINS**
Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261

**FIRE CONTROL**
The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369

**FLAME STABILITY**
Altitude ignition/lean deceleration study
[AIAA PAPER 86-1530] p 646 A86-42694

**FLAMES**
Flame driving of longitudinal instabilities in dump type ramjet combustors p 658 N86-28239

**FLAMMABILITY**
Light weight fire resistant graphite composites
[NASA-CLASS-ARC-11615-1SB] p 664 N86-28131

**FLAT PLATES**
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176908] p 676 N86-29159

**FLEXIBILITY**
NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076

**FLEXIBLE BODIES**
Calculation of the balancing efficiency of flexible rotors of compressor units on low-cycle balancing machines
p 673 A86-43379

**FLEXIBLE SPACECRAFT**
Transfer of alignment and calibration of multiple sensors in flexible systems p 681 A86-43003

**FLIGHT CHARACTERISTICS**
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092

**FLIGHT CONDITIONS**
Taming the killer wind shear p 678 A86-41035

**FLIGHT CONTROL**
The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767
New applications of mu to real-parameter variation problems — structured singular value theory for flight control systems stability analysis p 680 A86-42871
Eigenstructure assignment, eigensensitivity, and flight control design p 680 A86-42912
Eigenstructure synthesis of an oblique wing flight control system p 652 A86-42913
Integrated control - A decentralized approach
p 681 A86-42996
Initial design and evaluation of automatic restructurable flight control system concepts
[NASA-CR-178064] p 652 N86-28090
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092
Main flight controls --- Airbus
[SNIAS-861-111-111] p 653 N86-28096
Multi-input, multi-output system control for experimental aircraft
[NASA-CR-177017] p 654 N86-28955
Multivariable control of a twin lift helicopter system using the LQG/LTR design methodology
[NASA-CR-177025] p 654 N86-28956
Properties, applications, future of European gyro sensors p 676 N86-29082
An experiment in software reliability
[NASA-CR-172553] p 682 N86-29547

**FLIGHT CREWS**
Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29508

**FLIGHT FATIGUE**
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29028

**FLIGHT HAZARDS**
Taming the killer wind shear p 678 A86-41035

**FLIGHT INSTRUMENTS**
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172593] p 636 N86-28074
Interface of the transport systems research vehicle monochrome display system to the digital autonomous terminal access communication data bus
[NASA-TM-87728] p 656 N86-28961

**FLIGHT MANAGEMENT SYSTEMS**
Development and validation of the crew-station system-integration research facility
[NASA-TM-86341] p 622 N86-28051
An investigation of TNAV equipped aircraft in a simulated en route metering environment
[NASA-CR-178031] p 641 N86-28940

**FLIGHT PATHS**
Flightpath reconstruction and systematic radar error estimation from multi-radar range-azimuth measurements
p 636 A86-42986
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939

**FLIGHT SAFETY**
The market price for air safety p 633 A86-40226
Computerisation of air information services in France
p 635 A86-40229
The French air traffic control system today - A paradox p 635 A86-40230
Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232
Regulation by the Civil Aviation Authority of air safety in the United Kingdom p 633 A86-40565
Policing aviation safety in the Netherlands
p 633 A86-40567
Radio telephony - A case for growing concern
p 635 A86-40569
Measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques
p 634 A86-41694
Sophistication and safety in a semi-automated air traffic control system p 635 A86-41874

**FLIGHT SIMULATION**
CTOL ski jump - Analysis, simulation, and flight test
p 637 A86-40113
Simulator upgrade - Regulations and benefits
p 621 A86-40478
Software position and velocity limiting for a synergistic six degree-of-freedom motion system --- flight simulators
p 655 A86-42170
Development and validation of the crew-station system-integration research facility
[NASA-TM-86841] p 622 N86-28051
Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2)
[NASA-TM-87677] p 639 N86-28075
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177408] p 636 N86-28931

**FLIGHT SIMULATORS**
Flight simulator upgrades and modifications
p 655 A86-40477
An Orbital Maneuvering Vehicle simulator
p 658 A86-40515
Software position and velocity limiting for a synergistic six degree-of-freedom motion system --- flight simulators
p 655 A86-42170
Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29508

**FLIGHT TESTS**
CTOL ski jump - Analysis, simulation, and flight test
p 637 A86-40113
A report on the initial testing of the large scale advanced prop-fan
[AIAA PAPER 86-1551] p 647 A86-42708
Flight research on natural laminar flow nacelles - A progress report
[AIAA PAPER 86-1629] p 627 A86-42762
Application of system identification to aircraft flight test data processing p 638 A86-43002
Siting criteria for Microwave Landing Systems (MLS)
[FAA/PM-86/18] p 636 N86-28073
Application of parameter estimation to highly unstable aircraft
[NASA-TM-88266] p 639 N86-28078
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data
[NASA-TM-87632-PT-2] p 653 N86-28093
A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919
Development of flight testing techniques
[NASA-CR-176996] p 640 N86-28936
In-flight thrust determination on a real-time basis
[NASA-CR-176997] p 641 N86-28937
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950

**FLIGHT TRAINING**
Pilot report - B-1B p 634 A86-41275
Bringing on the B-1B p 621 A86-41276

**FLOW CHARACTERISTICS**
Features of the flow structure around polygonal lifting bodies at supersonic velocities p 628 A86-43421
An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064
Comparison of theoretical and flight-measured local flow aerodynamics for a low-aspect-ratio fin
[NASA-CR-176995] p 632 N86-28920
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176908] p 676 N86-29159

**FLOW DIRECTION INDICATORS**
Flow direction measurement criteria and techniques planned for the 40- by 80-/80- x 120-foot wind tunnel integrated systems tests
[NASA-CR-176969] p 676 N86-29152

**FLOW DISTORTION**
Experimental and numerical study of the response of an axial compressor to distorted inlet flow
p 644 A86-40736
Redistribution of an inlet temperature distortion in an axial flow turbine stage
[AIAA PAPER 86-1468] p 671 A86-42658
Solution of problems of conjugate heat transfer during flow past bodies of different shape p 673 A86-43370

**FLOW DISTRIBUTION**
Improved Euler analysis of advanced turboprop propeller flows
[AIAA PAPER 86-1521] p 625 A86-42688
Simulation of engine installation flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-1537] p 671 A86-42699
A comparison of computational methods for three-dimensional, turbulent turbomachinery flow fields
[AIAA PAPER 86-1599] p 626 A86-42740
A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751
Characterization of fuel sprays using a high-resolution patternator
[AIAA PAPER 86-1726] p 656 A86-42814
Laser fringe anemometry for aero engine components
[NASA-TM-88798] p 629 N86-28053
The flowfield of a side-dump combustor
p 673 N86-28237
Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240
Large eddy simulations of flow in a ramjet combustor
p 659 N86-28241
Investigation of empennage buffeting
[NASA-CR-177164] p 654 N86-28951
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173

**FLOW GEOMETRY**
Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code
[AIAA PAPER 86-1426] p 624 A86-42635

**FLOW MEASUREMENT**
Characterization of fuel sprays using a high-resolution patternator
[AIAA PAPER 86-1726] p 656 A86-42814
Reverse flow in multistage axial compressors
[AIAA PAPER 86-1747] p 627 A86-42825
Experience with laboratory LDA by measuring flow fields in rotating turbomachinery p 672 A86-43109
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375

**FLOW RESISTANCE**
Generalization of experimental data on the internal hydraulic resistance of laminated porous materials
p 650 A86-43383

**FLOW VISUALIZATION**
Investigation of the structure of a supersonic jet issuing from a free-vortex nozzle by means of pulsed holographic interferometry p 628 A86-43403
The flowfield of a side-dump combustor
p 673 N86-28237
Improvement in the quality of flow visualization in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87730] p 675 N86-28389

**FLUID DYNAMICS**
A simplified model of the turbulent microburst
[NASA-CR-177108] p 679 N86-29466

**FLUID FLOW**
A perspective of computational fluid dynamics
[NASA-TM-88246] p 629 N86-28057
Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242

**FLUID MECHANICS**
A study of the factors affecting boundary layer two-dimensionality in wind tunnels
[NASA-CR-177023] p 631 N86-28914

**FLUID PRESSURE**
Tip leakage reduction through tip injection in turbomachines
[AIAA PAPER 86-1746] p 627 A86-42824

**FLUTTER ANALYSIS**
Development of flight testing techniques [NASA-CR-176996] p 640 N86-28936
Flutter prediction for a wing with active aileron control [NASA-CR-176994] p 655 N86-28959
Experimental classical flutter reesults of a composite advanced turboprop model [NASA-TM-88792] p 678 N86-29271
**FLY BY WIRE CONTROL**
Optical technology for flight control systems [NASA-TM-88400] p 655 N86-28930
**FOAMS**
Development of a reusable, flight-weight cryogenic foam insulation system [AIAA PAPER 86-1189] p 658 A86-40612
**FORCED VIBRATION**
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems [NASA-CR-174967] p 675 N86-28463
**FOURIER TRANSFORMATION**
Weibull-distributed ground clutter in the frequency domain p 671 A86-41883
**FRACTURE MECHANICS**
Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984 p 662 A86-41051
An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41596
**FRACTURE STRENGTH**
Effect of precipitation on mechanical properties of Al-Li-Cu-Mg-Zr alloy p 661 A86-40306
**FREQUENCY MODULATION**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation) [AD-A165897] p 676 N86-29119
**FREQUENCY RESPONSE**
Identification of frequency characteristics during bench tests p 681 A86-43387
**FREQUENCY SHIFT**
Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242
**FRICTION**
Tribology in aircraft systems: Basic principles and applications p 677 N86-29240
**FRICTION DRAG**
An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction [NASA-CR-177133] p 630 N86-28064
**FUEL CONSUMPTION**
A new generation T56 turboprop engine p 642 A86-40133
After the big turbofans p 645 A86-42099
Influence of structural changes on the fuel-consumption efficiency of a transport aircraft p 638 A86-43380
Design requirements and development of an airborne descent path definition algorithm for time navigation [NASA-CR-178037] p 641 N86-28939
An investigation of TNAV equipped aircraft in a simulated en route metering environment [NASA-CR-178031] p 641 N86-28940
A supersonic fan equipped variable cycle engine for a Mach 2.7 supersonic transport [NASA-CR-177141] p 650 N86-28946
**FUEL CONTROL**
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane [NASA-CR-172593] p 636 N86-28074
Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft [NASA-CR-159251] p 639 N86-28077
**FUEL GAGES**
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft [NASA-TM-87706] p 675 N86-28385
**FUEL INJECTION**
Effect of different hydrogen-injection techniques on its burnup in a supersonic air flow p 664 A86-43420
**FUEL SPRAYS**
Characterization of fuel sprays using a high-resolution patternator [AIAA PAPER 86-1726] p 656 A86-42814
**FUEL TANKS**
A new approach to durability prediction for fuel tank skins --- aircraft industry p 642 A86-40119
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft [NASA-TM-87706] p 675 N86-28385
**FUNCTIONAL DESIGN SPECIFICATIONS**
Integrated control - A decentralized approach p 681 A86-42996
**FUSELAGES**
The influence of source location on the structural-acoustic interaction of cylinders --- in aerodynamics p 638 A86-41710

## G

**GAME THEORY**
An analysis of a four state model for pursuit-evasion games --- during air combat p 680 A86-42867
**GAS GENERATORS**
Solid fuel gas generator air --- Air TurboRamjet [AIAA PAPER 86-1682] p 649 A86-42792
**GAS INJECTION**
Tip leakage reduction through tip injection in turbomachines [AIAA PAPER 86-1746] p 627 A86-42824
**GAS TEMPERATURE**
Further development of the dynamic gas temperature measurement system [AIAA PAPER 86-1648] p 672 A86-42770
**GAS TURBINE ENGINES**
Compressor erosion and performance deterioration p 643 A86-40727
Design features for performance retention in the CFM56 engine p 643 A86-40729
Effect of particle characteristics on trajectories and blade impact patterns p 643 A86-40731
Prediction of fouled compressor performance using stage stacking techniques p 643 A86-40732
Clearance effects on heat transfer at the tips of plain and grooved turbine airfoils p 644 A86-40737
Direct and system effects of water ingestion into jet engine compressors p 644 A86-40739
Substantiation of regimes for accelerated equivalent tests of gas-turbine aeroengines p 644 A86-41549
Air turbine test results for three turbine stages with varying radial distribution of camber [AIAA PAPER 86-1467] p 645 A86-42657
Turbine airfoil LCF life prediction verification [AIAA PAPER 86-1496] p 646 A86-42672
Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems [AIAA PAPER 86-1545] p 636 A86-42704
Small engine propulsion readiness for the 21st century [AIAA PAPER 86-1624] p 647 A86-42758
Further development of the dynamic gas temperature measurement system [AIAA PAPER 86-1648] p 672 A86-42770
Knowledge-based systems for rotordynamic diagnostics [AIAA PAPER 86-1678] p 648 A86-42789
Calculation of the characteristics of a multistage gas turbine with allowance for the circumferential nonuniformity of inlet temperature p 649 A86-43381
The development of a model for the unstable operation of a turbocompressor and the design of a device to protect a gas turbine engine against stalling and surging p 650 A86-43390
Modeling the combustion zone of gas-turbine-engine combustion chambers p 650 A86-43393
Small film-evaporation type combustion chamber for a low-power gas turbine engine p 650 A86-43395
Thermal stability of gas turbine blades with protective coatings p 673 A86-43410
A method for the analytical determination of accelerated test schedules for compressor blades working in a corrosive medium p 673 A86-43411
**GAS TURBINES**
Protective coating systems for high-temperature gas turbine components; Proceedings of the Conference, London, England, November 13, 14, 1984 p 664 A86-43134
Use of protective coatings in aero gas turbine engines p 664 A86-43147
**GAS-SOLID INTERFACES**
Rotational-translational subsonic motion of a finite-span wing in an ideal gas p 629 A86-43384
**GASEOUS FUELS**
Effect of different hydrogen-injection techniques on its burnup in a supersonic air flow p 664 A86-43420
**GEARS**
Aircraft and Bearing Tribological Systems [AGARD-CP-394] p 677 N86-29236
A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant p 666 N86-29242
Multifunctional requirements for a gearbox secondary power system in a modern fighter aircraft and its components and interface requirements p 678 N86-29243
Direction of R and D and current status of understanding of advanced gear steels p 666 N86-29245
Future trends in helicopter transmission lubricants p 666 N86-29250
Scoring tests of aircraft transmission lubricants at high speeds and high temperatures p 667 N86-29253
**GENERAL AVIATION AIRCRAFT**
Dual-wing systems with decalage angle optimization p 624 A86-40121
Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems [AIAA PAPER 86-1545] p 636 A86-42704
High performance, stratified charge rotary engines for general aviation [AIAA PAPER 86-1553] p 647 A86-42710
Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue number 10 of 1984 accidents [PB86-916906] p 634 N86-28070
Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft [NASA-CR-159251] p 639 N86-28077
**GEOMETRY**
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications [NASA-TM-88228] p 630 N86-28062
**GEOTECHNICAL FABRICS**
Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria [DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28983
**GLASS FIBER REINFORCED PLASTICS**
Effect of moisture on thermal properties of composite materials for aerospace applications p 661 A86-40345
Experiences in UK and France in aerospace application --- of glass and carbon fiber reinforced composites p 621 A86-40499
**GLIDE PATHS**
Design technique to reduce effects of tidal variations on an ILS glide slope system p 635 A86-41335
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data [NASA-TM-87632-PT-2] p 653 N86-28093
Investigations for improving operational reliability and maintainability of ILS components. Volume 2: Figures and illustrations [FAA/PM-86/7.11-VOL-2] p 636 N86-28932
**GLIDERS**
Processing and meteorological evaluation of research flights with DFVLR motor gliders using the software package RAMF [DFVLR-FB-85-57] p 678 N86-28586
**GOVERNMENT PROCUREMENT**
The T800 turbine engine solicitation - A new thrust in streamlining the acquisition process [AIAA PAPER 86-1669] p 684 A86-42782
**GOVERNMENT/INDUSTRY RELATIONS**
The T800 turbine engine solicitation - A new thrust in streamlining the acquisition process [AIAA PAPER 86-1669] p 684 A86-42782
**GRAPHITE**
Advanced rotary engine components utilizing fiber reinforced Mg castings [AIAA PAPER 86-1559] p 663 A86-42712
Light weight fire resistant graphite composites [NASA-CLASS-ARC-11615-1SB] p 664 N86-28131
**GRAPHITE-EPOXY COMPOSITES**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344
Characterization of T300/V-378A graphite/bismaleimide for structural applications p 662 A86-41053
A fiber optic damage monitor p 670 A86-41605
Response of composite material shallow arch to concentrated load p 670 A86-41609
**GROUND BASED CONTROL**
Investigations for improving operational reliability and maintainability of ILS components. Volume 2: Figures and illustrations [FAA/PM-86/7.11-VOL-2] p 636 N86-28932
**GROUND EFFECT (AERODYNAMICS)**
Ground effect on slender wings at moderate and high angles of attack p 623 A86-40108
Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112
A theoretical study of deltoid planforms operating in the ground effect region p 638 A86-41977
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model [NASA-TM-88218] p 629 N86-28056
**GROUND EFFECT (COMMUNICATIONS)**
Weibull-distributed ground clutter in the frequency domain p 671 A86-41883
**GROUND TESTS**
Identification of frequency characteristics during bench tests p 681 A86-43387
Uniform engine testing program phase 7: NASA Lewis Research Center second entry [NASA-TM-87272] p 650 N86-28085
**GUIDANCE (MOTION)**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems [AGARD-CP-380] p 674 N86-28337

GUIDANCE SENSORS
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337

GUST ALLEVIATORS
The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767

GYROSCOPES
Properties, applications, future of European gyro sensors p 676 N86-29062

## H

HALL EFFECT
Flow direction measurement criteria and techniques planned for the 40- by 80-/80- x 120-foot wind tunnel integrated systems tests
[NASA-CR-176989] p 676 N86-29152

HARDENING (MATERIALS)
Laser metalworking technology transfer
[AD-A165606] p 664 N86-28168

HARMONIC CONTROL
Dual control and prevention of the turn-off phenomenon in a class of mimo systems p 681 A86-43000

HARRIER AIRCRAFT
Application of system identification to aircraft flight test data processing p 638 A86-43002

HEAT RESISTANT ALLOYS
Thermal stability of gas turbine blades with protective coatings p 673 A86-43410

HEAT TRANSFER
Solution of problems of conjugate heat transfer during flow past bodies of different shape p 673 A86-43370

HEAT TREATMENT
Direction of R and D and current status of understanding of advanced gear steels p 666 N86-29245

HEAVY LIFT AIRSHIPS
The Cyclo-Crane - A hybrid airship concept
p 638 A86-41976

HELICOPTER CONTROL
On the relationship between robustness tests and their application to helicopter control system designs
p 652 A86-40771
Dual control and prevention of the turn-off phenomenon in a class of mimo systems p 681 A86-43000
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177406] p 636 N86-28931
Individual-blade-control research in the MIT VTOL Technology Laboratory 1977-1985
[NASA-CR-177121] p 654 N86-28954

HELICOPTER DESIGN
On the relationship between robustness tests and their application to helicopter control system designs
p 652 A86-40771
Computing codes for development of helicopter crashworthy structures and test substantiation
[SNIAS-861-210-106] p 640 N86-28084
Nonlinear control of aircraft
[NASA-TM-88225] p 655 N86-28958

HELICOPTER ENGINES
Helicopter rotor and engine sizing for preliminary performance estimation
[AIAA PAPER 86-1756] p 628 A86-42829

HELICOPTER WAKES
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935

HELICOPTERS
Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232
Development and validation of the crew-station system-integration research facility
[NASA-TM-88841] p 622 N86-28051
An analysis of blade vortex interaction aerodynamics and acoustics
[NASA-CR-177016] p 630 N86-28912
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917
New transparent solid material for helicopter windshields
[SNPE-NT-37/85/CRB/NP] p 641 N86-28941
Aeroelastic tests of OA 206 and OA 207 profiles
[ONERA-RT-22/1841-RY-310-R] p 641 N86-28942
Multivariable control of a twin lift helicopter system using the LQG/LTR design methodology
[NASA-CR-177025] p 654 N86-28956
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236
Effects of unfavorable environmental conditions on the service life of jet engine and helicopter bearings
p 677 N86-29238
A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant p 666 N86-29242
Requirements on lubricatin oil from the view of a helicopter manufacturer p 666 N86-29244
Direction of R and D and current status of understanding of advanced gear steels p 666 N86-29245
Future trends in helicopter transmission lubricants
p 666 N86-29250

HIGH RESOLUTION
The calculation of the entropy distribution along cloud traverses using aircraft measurements
p 678 A86-40555

HIGH REYNOLDS NUMBER
Experimental investigation of the turbulent boundary layer at high Reynolds numbers and a Mach number of 0.8 p 624 A86-42168

HIGH SPEED
Theoretical and experimental analysis of highspeed propeller aerodynamics
[AIAA PAPER 86-1549] p 626 A86-42706

HIGH STRENGTH ALLOYS
Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys
p 660 A86-40303
Development of properties within high-strength aluminium-lithium alloys p 660 A86-40304
Age hardening behavior of DTD XXXA --- high-strength aluminum-lithium alloy (Lital A) p 660 A86-40305
Effect of precipitation on mechanical properties of Al-Li-Cu-Mg-Zr alloy p 661 A86-40306
Deformation and fracture in Al-Li base alloys
p 661 A86-40312
A study of optimizing cutting tool performance in high tensile strength materials p 668 A86-40527

HIGH STRENGTH STEELS
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes
p 662 A86-40575
New vistas in the determination of hydrogen in aerospace engine metal alloys
[AIAA PAPER 86-1479] p 663 A86-42665

HIGH TEMPERATURE
Aircraft engine oils and their behaviour at high temperatures p 667 N86-29251

HIGH TEMPERATURE RESEARCH
Protective coating systems for high-temperature gas turbine components; Proceedings of the Conference, London, England, November 13, 14, 1984
p 664 A86-43134

HIGH TEMPERATURE TESTS
Characterization of T300/V-378A graphite/bismaleimide for structural applications
p 662 A86-41053

HIGHWAYS
USSR report: Transportation
[JPRS-UTR-86-007] p 622 N86-28908

HOLE GEOMETRY (MECHANICS)
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes
p 662 A86-40575

HOLOGRAPHIC INTERFEROMETRY
Optical determination of the effects of a microminiature accelerometer on resonance of a small airfoil
p 668 A86-40712
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105
Investigation of the structure of a supersonic jet issuing from a free-vortex nozzle by means of pulsed holographic interferometry p 628 A86-43403

HOT CORROSION
Influence of molybdenum, tungsten, and cobalt on the corrosion of high-temperature strength nickel alloys in molten salts p 663 A86-41988

HOVERING
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[NASA-TM-88218] p 629 N86-28056
Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060
An experimental and analytical investigation of isolated rotor flap-lag stability in forward flight
[NASA-CR-177028] p 654 N86-28957

HOVERING STABILITY
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935

HUMAN FACTORS ENGINEERING
Development and validation of the crew-station system-integration research facility
[NASA-TM-88841] p 622 N86-28051
Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29506

HYDRAULIC EQUIPMENT
Software position and velocity limiting for a synergistic six degree-of-freedom motion system --- flight simulators
p 655 A86-42170
Requirements on lubricatin oil from the view of a helicopter manufacturer p 666 N86-29244

HYDRAULICS
Generalization of experimental data on the internal hydraulic resistance of laminated porous materials
p 650 A86-43383

HYDROGEN EMBRITTLEMENT
New vistas in the determination of hydrogen in aerospace engine metal alloys
[AIAA PAPER 86-1479] p 663 A86-42665

HYDROGEN ENGINES
New vistas in the determination of hydrogen in aerospace engine metal alloys
[AIAA PAPER 86-1479] p 663 A86-42665

HYDROGEN FUELS
Effect of different hydrogen-injection techniques on its burnup in a supersonic air flow p 664 A86-43420

HYPERPLANES
Two approaches to hyperplane design in multivariable variable structure control systems p 680 A86-41934

HYPERSONIC FLIGHT
Effect of longitudinal-contour shape on the aerodynamic characteristics of lifting bodies at supersonic and hypersonic flight velocities p 628 A86-43402

HYPERSONIC FLOW
Measured and predicted heating distributions for biconics at Mach 10 p 624 A86-41734
Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models
[AIAA PAPER 86-1595] p 647 A86-42737

HYPERSONIC INLETS
Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code
[AIAA PAPER 86-1426] p 624 A86-42635

HYSTERESIS
Critical evaluation of the unsteady aerodynamics approach to dynamic stability at high angles of attack
[NASA-CR-177104] p 632 N86-28924

## I

ICE FORMATION
The measurement of aircraft performance and stability and control after flight through natural icing conditions
[AIAA PAPER 86-9758] p 651 A86-40681
Measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques
p 634 A86-41694
A turbine engine inlet viewing system
[AIAA PAPER 86-1647] p 656 A86-42769

IDEAL GAS
Rotational-translational subsonic motion of a finite-span wing in an ideal gas p 628 A86-43384

IGNITION LIMITS
Altitude ignition/lean deceleration study
[AIAA PAPER 86-1530] p 646 A86-42694

IMPACT DAMAGE
Effect of particle characteristics on trajectories and blade impact patterns p 643 A86-40731
Application of medical computed tomography (CT) scanners to advanced aerospace composites
p 670 A86-41631

IMPACT LOADS
Response of composite material shallow arch to concentrated load p 670 A86-41699

IMPELLERS
Dilute gas-particle flow in a centrifugal compressor impeller p 668 A86-40733
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105

IN-FLIGHT MONITORING
A fiber optic damage monitor p 670 A86-41605
Prospects for intelligent aerospace structures
[AIAA PAPER 86-1139] p 672 A86-43328

INCIDENCE
Experimental analyses of trailing edge flows
[NASA-CR-176904] p 632 N86-28921

INCOHERENT SCATTER RADAR
Incoherent imaging of radar targets
p 667 A86-40215

INCOMPRESSIBLE FLOW
Indicial coefficients for a cropped delta wing in incompressible flow p 623 A86-40111

!NEQUALITIES
On the relationship between robustness tests and their application to helicopter control system designs
p 652 A86-40771

INFORMATION SYSTEMS
Computerisation of air information services in France
p 635 A86-40229

**INFRARED RADAR**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337

**INGESTION (ENGINES)**
Transient engine performance with water ingestion
[AIAA PAPER 86-1621] p 647 A86-42755

**INJECTION**
Cryogenic wind tunnels: Problems of continuous operation at low temperatures
[NASA-TM-88446] p 656 N86-28099

**INLET FLOW**
Experimental and numerical study of the response of an axial compressor to distorted inlet flow
p 644 A86-40736
Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code
[AIAA PAPER 86-1426] p 624 A86-42635
An LU implicit scheme for high speed inlet analysis
[AIAA PAPER 86-1520] p 625 A86-42687
Axial-flow fan stalling behavior with circumferential inlet sectoring
[AIAA PAPER 86-1622] p 626 A86-42756
A numerical analysis applied to high angle of attack three-dimensional inlets
[AIAA PAPER 86-1527] p 627 A86-42760
Collocation for an integral equation arising in duct acoustics p 682 A86-43038

**INLET TEMPERATURE**
Redistribution of an inlet temperature distortion in an axial flow turbine stage
[AIAA PAPER 86-1468] p 671 A86-42658
Calculation of the characteristics of a multistage gas turbine with allowance for the circumferential nonuniformity of inlet temperature p 649 A86-43381

**INPUT**
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092

**INSTRUMENT ERRORS**
Flightpath reconstruction and systematic radar error estimation from multi-radar range-azimuth measurements
p 636 A86-42966

**INSTRUMENT FLIGHT RULES**
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177408] p 636 N86-28931

**INSTRUMENT LANDING SYSTEMS**
Design technique to reduce effects of tidal variations on an ILS glide slope system p 635 A86-41335
Runway requirements in instrument flight traffic at regional airports and commercial landing areas
p 635 A86-41873
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177408] p 636 N86-28931
Investigations for improving operational reliability and maintainability of ILS components. Volume 2: Figures and illustrations
[FAA/PM-86/7.11-VOL-2] p 636 N86-28932

**INTEGRAL EQUATIONS**
Collocation for an integral equation arising in duct acoustics p 682 A86-43038

**INTEGRATED CIRCUITS**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337
The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369
The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372

**INTERACTIONAL AERODYNAMICS**
Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112
The influence of source location on the structural-acoustic interaction of cylinders --- in aerodynamics p 638 A86-41710
Wake induced unsteady aerodynamic interactions in a multi-stage compressor
[AIAA PAPER 86-1455] p 625 A86-42653
Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709
Interactions between acoustics and vortex structures in a central dump combustor
[AIAA PAPER 86-1609] p 671 A86-42749
Mathematical model of the interaction of a single unsteady supersonic jet with a moving barrier of finite size p 628 A86-43401

**INTERFACES**
Investigation of an advanced fault tolerant integrated avionics system
[NASA-CR-176980] p 642 N86-28945

**INTERFEROMETERS**
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375

**INVISCID FLOW**
An LU implicit scheme for high speed inlet analysis
[AIAA PAPER 86-1520] p 625 A86-42687
Improved Euler analysis of advanced turboprop propeller flows
[AIAA PAPER 86-1521] p 625 A86-42688

**ITERATIVE SOLUTION**
Design of transonic airfoils with given pressure, subject to geometric constraints
[NLR-TR-84064-U] p 633 N86-28928

## J

**JACKS (LIFTS)**
Multivariable control of a twin lift helicopter system using the LQG/LTR design methodology
[NASA-CR-177025] p 654 N86-28956

**JET AIRCRAFT**
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080

**JET ENGINE FUELS**
Solid fuel gas generator air --- Air TurboRamjet
[AIAA PAPER 86-1682] p 649 A86-42792

**JET ENGINES**
Simulation of engine installation flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-1537] p 671 A86-42699
Transient engine performance with water ingestion
[AIAA PAPER 86-1621] p 647 A86-42755
A fault-tolerant 1750A engine controller
[AIAA PAPER 86-1675] p 648 A86-42786
Effects of unfavorable environmental conditions on the service life of jet engine and helicopter bearings
p 677 N86-29238
Military aircraft propulsion lubricants: Current and future trends p 666 N86-29249
Multivariable control systems with saturating actuators antireset windup strategies
[NASA-CR-177100] p 682 N86-29580

**JET EXHAUST**
Application of laser-dual-focus velocimetry in a counterflow p 628 A86-43110
Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922

**JET FLOW**
Flight effects on noise from coaxial dual flow. II - Heated jets p 644 A86-41708

**JET IMPINGEMENT**
The flowfield of a side-dump combustor
p 673 N86-28237

**JOINTS (JUNCTIONS)**
Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria
[DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

## K

**KALMAN FILTERS**
Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors
[NASA-TM-88996] p 637 N86-28933

**KNOWLEDGE**
The impact of artificial intelligence on airborne maritime reconnaissance p 675 N86-28374

## L

**L-1011 AIRCRAFT**
Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693

**LAMINAR FLOW**
Flight research on natural laminar flow nacelles - A progress report
[AIAA PAPER 86-1629] p 627 A86-42762
Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft
[NASA-CR-159251] p 639 N86-28077

**LAMINATES**
Optimal design of antisymmetric laminated composite plates p 667 A86-40109
Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052
Characterization of T300/V-378A graphite/bismaleimide for structural applications
p 662 A86-41053
Composite repair at the Naval Air Rework Facility, North Island --- composite aircraft structures
[AIAA PAPER 86-1140] p 664 A86-43329

**LANDING AIDS**
Runway requirements in instrument flight traffic at regional airports and commercial landing areas
p 635 A86-41873
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177408] p 636 N86-28931

**LANGUAGES**
Language problems in air traffic control
p 635 A86-40570

**LARGE SPACE STRUCTURES**
Failure detection and accommodation in structural dynamics systems using analytic redundancy --- in large space structures p 658 A86-42938

**LASER ANEMOMETERS**
Laser fringe anemometry for aero engine components
[NASA-TM-88798] p 629 N86-28053

**LASER APPLICATIONS**
Laser metalworking technology transfer
[AD-A165808] p 664 N86-28168
Aeritalia: Avionics, optoelectronics research, ATR 42
p 642 N86-29080
Properties, applications, future of European gyro sensors p 676 N86-29082

**LASER DOPPLER VELOCIMETERS**
Experience with laboratory LDA by measuring flow fields in rotating turbomachinery p 672 A86-43109
Application of laser-dual-focus velocimetry in a counterflow p 628 A86-43110

**LASER INTERFEROMETRY**
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375

**LATERAL CONTROL**
The design of a sliding mode controller for dutch roll damping in a non-linear aircraft system
p 651 A86-40766
Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922

**LEADING EDGES**
A theory for lateral wing-tip blowing
[NASA-CR-176931] p 632 N86-28923
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176906] p 676 N86-29159

**LIFE CYCLE COSTS**
Effect of engine technology on advanced fighter design and cost p 644 A86-41691
Small turboshaft/turboprop engine technology study
[AIAA PAPER 86-1623] p 647 A86-42757

**LIFT**
Application of continuous vorticity panels to general unsteady incompressible two-dimensional lifting flows
p 624 A86-41690
The use of a panel code on high lift configurations of a swept forward wing
[NASA-CR-176968] p 631 N86-28916
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176906] p 676 N86-29159

**LIFT AUGMENTATION**
The lift of sharp-leading-edged delta wings with blowing
[NASA-CR-176967] p 631 N86-28915

**LIFT DRAG RATIO**
Analytical observations on the aerodynamics of a delta wing with leading edge flaps
[NASA-CR-177022] p 630 N86-28913

**LIFTING BODIES**
Unsteady transonic flow calculations for interfering lifting surface configurations p 623 A86-40118
Effect of longitudinal-contour shape on the aerodynamic characteristics of lifting bodies at supersonic and hypersonic flight velocities p 628 A86-43402
Features of the flow structure around polygonal lifting bodies at supersonic velocities p 628 A86-43421
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935

**LIFTING ROTORS**
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935

**LIGHT AIRCRAFT**
Small engine propulsion readiness for the 21st century
[AIAA PAPER 86-1624] p 647 A86-42758

**LIGHT ALLOYS**
New alloys from the quantum engineer
p 663 A86-42424

**LIGHTNING SUPPRESSION**
Protecting electronics against lightning gets harder
p 633 A86-41034
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695

**LINEAR SYSTEMS**
The design and implementation of multivariable variable structure control systems p 679 A86-40762

Robust simplified adaptive control for a class of multivariable continuous-time systems p 680 A86-42860

Dual control and prevention of the turn-off phenomenon in a class of mimo systems p 681 A86-43000

**LIQUID CHROMATOGRAPHY**

Chemical control for Airbus composites. HPLC standardization [I-104/84] p 664 N86-28133

**LIQUID COOLING**

High performance, stratified charge rotary engines for general aviation [AIAA PAPER 86-1553] p 647 A86-42710

**LIQUID NITROGEN**

Cryogenic wind tunnels: Problems of continuous operation at low temperatures [NASA-TM-88446] p 656 N86-28099

**LITHIUM ALLOYS**

Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford University, England, July 8-11, 1985 p 659 A86-40251

Overview — of new metallic and nonmetallic aircraft materials p 659 A86-40252

Production of aluminium-lithium alloy with high specific properties p 659 A86-40255

'Alithalite' alloys - Progress, products and properties p 660 A86-40256

Adhesive bonding of aluminium-lithium alloys p 660 A86-40267

Comparison of corrosion behaviour of lithium-containing aluminium alloys and conventional aerospace alloys p 660 A86-40280

Textures developed in Al-Li-Cu-Mg alloy p 660 A86-40291

Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys p 660 A86-40303

Development of properties within high-strength aluminium-lithium alloys p 660 A86-40304

Effect of precipitation on mechanical properties of Al-Li-Cu-Mg-Zr alloy p 661 A86-40306

Deformation and fracture in Al-Li base alloys p 661 A86-40312

**LOAD DISTRIBUTION (FORCES)**

Aircraft barricade [AD-D012194] p 656 N86-28102

**LOADS (FORCES)**

Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2) [NASA-TM-87677] p 639 N86-28075

An introductory course on aircraft loading [NLR-MP-84090-U] p 641 N86-28943

**LOGIC DESIGN**

The impact of very high performance integrated circuits on avionics system readiness p 674 N86-28373

**LOGISTICS MANAGEMENT**

Developing a maintenance concept for future electronic systems [AIAA PAPER 86-1145] p 684 A86-43333

**LONGITUDINAL CONTROL**

The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767

Multiaxis aircraft control power from thrust vectoring at high angles of attack [NASA-TM-87741] p 629 N86-28054

Multi-input, multi-output system control for experimental aircraft [NASA-CR-177017] p 654 N86-28955

**LONGITUDINAL STABILITY**

Development of flight testing techniques [NASA-CR-176996] p 640 N86-28936

**LOOPS**

Effect of time delay on flying qualities: An update [NASA-TM-88264] p 653 N86-28092

Aircraft barricade [AD-D012194] p 656 N86-28102

**LOW ALTITUDE**

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695

**LOW ASPECT RATIO**

Analytical observations on the aerodynamics of a delta wing with leading edge flaps [NASA-CR-177022] p 630 N86-28913

**LOW ASPECT RATIO WINGS**

Comparison of theoretical and flight-measured local flow aerodynamics for a low-aspect-ratio fin [NASA-CR-176995] p 632 N86-28920

**LOW FREQUENCIES**

Interaction of airborne and structureborne noise radiated by plates. Volume 1: Analytical study [NASA-TM-87746] p 683 N86-29633

**LUBRICANTS**

Tribology in aircraft systems: Basic principles and applications p 677 N86-29240

A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant p 666 N86-29242

Future trends in helicopter transmission lubricants p 666 N86-29250

**LUBRICATING OILS**

X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430

Aircraft and Bearing Tribological Systems [AGARD-CP-394] p 677 N86-29236

Requirements on lubricatin oil from the view of a helicopter manufacturer p 666 N86-29244

Military aircraft propulsion lubricants: Current and future trends p 666 N86-29249

Aircraft engine oils and their behaviour at high temperatures p 667 N86-29251

Scoring tests of aircraft transmission lubricants at high speeds and high temperatures p 667 N86-29253

**LUGS**

Damage tolerance assessment of aircraft attachment lugs p 672 A86-43084

## M

**MACH NUMBER**

Evaluation of a quartz bourdon pressure gage of wind tunnel Mach number control system application [NASA-TM-88991] p 677 N86-29198

**MAGNESIUM ALLOYS**

Textures developed in Al-Li-Cu-Mg alloy p 660 A86-40291

Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys p 660 A86-40303

Advanced rotary engine components utilizing fiber reinforced Mg castings [AIAA PAPER 86-1559] p 663 A86-42712

**MAGNETIC MATERIALS**

Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys [PB86-184314] p 665 N86-28186

**MAINTAINABILITY**

Design for engine supportability [AIAA PAPER 86-1671] p 648 A86-42784

**MAN MACHINE SYSTEMS**

Development and validation of the crew-station system-integration research facility [NASA-TM-86841] p 622 N86-28051

Effect of time delay on flying qualities: An update [NASA-TM-88264] p 653 N86-28092

Pilot interaction with automated airborne decision making systems [NASA-CR-177002] p 679 N86-29508

Optimal cooperative control synthesis of active displays [NASA-177102] p 683 N86-29651

**MANUAL CONTROL**

The integrated manual and automatic control of complex flight systems [NASA-CR-177086] p 654 N86-28952

Optimal cooperative control synthesis of active displays [NASA-177102] p 683 N86-29651

**MANUFACTURING**

Laser metalworking technology transfer [AD-A165808] p 664 N86-28168

**MAPPING**

Analytical observations on the aerodynamics of a delta wing with leading edge flaps [NASA-CR-177022] p 630 N86-28913

Nonlinear control of aircraft [NASA-TM-89225] p 655 N86-28958

**MARINE TRANSPORTATION**

USSR report: Transportation [JPRS-UTR-86-007] p 622 N86-28908

**MASS BALANCE**

Calculation of the balancing efficiency of flexible rotors of compressor units on low-cycle balancing machines p 673 A86-43379

**MATERIALS HANDLING**

Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys [PB86-184314] p 665 N86-28186

Multivariable control of a twin lift helicopter system using the LQG/LTR design methodology [NASA-CR-177025] p 654 N86-28956

**MATHEMATICAL MODELS**

Laser fringe anemometry for aero engine components [NASA-TM-88796] p 629 N86-28053

Siting criteria for Microwave Landing Systems (MLS) [FAA/PM-86/18] p 636 N86-28073

Computation of the transonic flow about a swept wing in the presence of an engine nacelle [NASA-CR-177113] p 630 N86-28911

Analytical observations on the aerodynamics of a delta wing with leading edge flaps [NASA-CR-177022] p 630 N86-28913

A study of the factors affecting boundary layer two-dimensionality in wind tunnels [NASA-CR-177023] p 631 N86-28914

Wake shape and its effects on aerodynamic characteristics [NASA-CR-176116] p 631 N86-28918

Aeroelastic tests of OA 206 and OA 207 profiles [ONERA-RT-22/1941-RY-310-R] p 641 N86-28942

Multivariable control of a forward swept wing aircraft [NASA-CR-177112] p 654 N86-28953

Multi-input, multi-output system control for experimental aircraft [NASA-CR-177017] p 654 N86-28955

An experimental and analytical investigation of isolated rotor flap-lag stability in forward flight [NASA-CR-177028] p 654 N86-28957

Boundary layer model to compute the edge effects in stratified composite plates [ONERA-RT-7/3542-RY-041-R] p 678 N86-29279

A simplified model of the turbulent microburst [NASA-CR-177108] p 679 N86-29466

Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study [NASA-TM-87747] p 683 N86-29632

**MATRIX METHODS**

Linear and nonlinear dynamic analysis of redundant load path bearingless rotor systems [NASA-CR-177098] p 682 N86-29579

**MEASURING INSTRUMENTS**

Laser fringe anemometry for aero engine components [NASA-TM-88796] p 629 N86-28053

Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft [NASA-TM-87706] p 675 N86-28385

**MECHANICAL PROPERTIES**

Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford University, England, July 8-11, 1985 p 659 A86-40251

Production of aluminium-lithium alloy with high specific properties p 659 A86-40255

'Alithalite' alloys - Progress, products and properties p 660 A86-40256

Textures developed in Al-Li-Cu-Mg alloy p 660 A86-40291

Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys p 660 A86-40303

Development of properties within high-strength aluminium-lithium alloys p 660 A86-40304

Age hardening behavior of DTD XXXA — high-strength aluminum-lithium alloy (Lital A) p 660 A86-40305

Technical status and future prospects of carbon fibres and their application in composites with polymer matrix (CFRPs) p 661 A86-40488

Structural materials in aeronautics. II - Prospects and perspectives p 662 A86-40619

Characterization of T300/V-378A graphite/bismaleimide for structural applications p 662 A86-41053

Direction of R and D and current status of understanding of advanced gear steels p 666 N86-29245

**MEMORY (COMPUTERS)**

The impact of very high performance integrated circuits on avionics system readiness p 674 N86-28373

NASA supercomputer system to become available nationally [NASA-NEWS-RELEASE-86-92] p 681 N86-28628

**METAL CUTTING**

A study of optimizing cutting tool performance in high tensile strength materials p 668 A86-40527

**METAL FATIGUE**

Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue [AD-A166429] p 665 N86-29028

**METAL PARTICLES**

X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430

**METAL SHEETS**

Age hardening behavior of DTD XXXA — high-strength aluminum-lithium alloy (Lital A) p 660 A86-40305

**METAL SPRAYING**

The future of surface treatments in aeronautical construction [SNIAS-861-551-101] p 665 N86-29037

**METAL WORKING**

Laser metalworking technology transfer [AD-A165808] p 664 N86-28168

**METALLURGY**

Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford University, England, July 8-11, 1985 p 659 A86-40251

New alloys from the quantum engineer p 663 A86-42424

**METALS**
Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys
[PB86-184314] p 665 N86-28186
Development of a portable wear metal analyzer for field use
[AD-A166013] p 622 N86-28906
**METEOROLOGICAL FLIGHT**
Sampling of solid particles in clouds
p 668 A86-40720
Processing and meteorological evaluation of research flights with DFVLR motor gliders using the software package RAMF
[DFVLR-FB-85-57] p 678 N86-28588
**METEOROLOGICAL SERVICES**
Taming the killer wind shear p 678 A86-41035
**METHANE**
Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610
**METHOD OF CHARACTERISTICS**
Calculation of annular nozzle trisonic flowfields by the method of characteristics
[AIAA PAPER 86-1519] p 625 A86-42686
**MICROBURSTS**
Taming the killer wind shear p 678 A86-41035
A simpified model of the turbulent microburst
[NASA-CR-177108] p 679 N86-29466
**MICROELECTRONICS**
The future of bipolar technology for avionics
p 674 N86-28341
**MICROPROCESSORS**
Properties, applications, future of European gyro sensors p 676 N86-29082
**MICROSTRUCTURE**
Age hardening behavior of DTD XXXA --- high-strength aluminum-lithium alloy (Lital A) p 660 A86-40305
Deformation and fracture in Al-Li base alloys
p 661 A86-40312
**MICROWAVE LANDING SYSTEMS**
Siting criteria for Microwave Landing Systems (MLS)
[FAA/PM-86/18] p 636 N86-28073
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data
[NASA-TM-87632-PT-2] p 653 N86-28093
Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors
[NASA-TM-88998] p 637 N86-28933
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950
**MILITARY AIRCRAFT**
A new generation T56 turboprop engine
p 642 A86-40133
Naces - Today's ultimate seat p 637 A86-40472
**MILITARY AVIATION**
Expert systems for aviation maintenance
[AIAA PAPER 86-1143] p 622 A86-43332
**MILITARY HELICOPTERS**
The T800 turbine engine solicitation - A new thrust in streamlining the acquisition process
[AIAA PAPER 86-1669] p 684 A86-42782
**MILITARY TECHNOLOGY**
Developing a maintenance concept for future electronic systems
[AIAA PAPER 86-1145] p 684 A86-43333
**MILITARY VEHICLES**
Digital simulation of regulated electrical power supplies for military applications p 669 A86-40775
**MILLING (MACHINING)**
A study of optimizing cutting tool performance in high tensile strength materials p 668 A86-40527
**MINIATURIZATION**
Application of a computer model to electric current perturbation probe design p 669 A86-41576
**MISSILE CONFIGURATIONS**
Transonic and supersonic wind tunnel tests on schematic missile configurations with two different nose lengths
[FFA-TN-1984-62] p 630 N86-28066
**MIXING**
A detailed numerical model of a supersonic reacting mixing layer
[AIAA PAPER 86-1427] p 671 A86-42636
**MODAL RESPONSE**
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463
**MODELS**
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917
Experimental classical flutter results of a composite advanced turboprop model
[NASA-TM-88792] p 678 N86-29271
**MOISTURE CONTENT**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344
Effect of moisture on thermal properties of composite materials for aerospace applications
p 661 A86-40345
**MOLDS**
Autoclave, compression moulding p 668 A86-40495
**MOLTEN SALTS**
Influence of molybdenum, tungsten, and cobalt on the corrosion of high-temperature strength nickel alloys in molten salts p 663 A86-41986
**MOTION SIMULATION**
Software position and velocity limiting for a synergistic six degree-of-freedom motion system --- flight simulators
p 655 A86-42170
**MOTOR VEHICLES**
USSR report: Transportation
[JPRS-UTR-86-007] p 622 N86-28908
**MULTILAYER INSULATION**
Development of a reusable, flight-weight cryogenic foam insulation system
[AIAA PAPER 86-1189] p 656 A86-40612
**MULTIPROCESSING (COMPUTERS)**
Investigation of an advanced fault tolerant integrated avionics system
[NASA-CR-176980] p 642 N86-28945

## N

**NACELLES**
Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709
Propfan test assessment (PTA) quick engine change (QEC) nacelle
[AIAA PAPER 86-1626] p 648 A86-42759
Correlation of theory and experiment for propfan inlets
[AIAA PAPER 86-1628] p 627 A86-42761
Flight research on natural laminar flow nacelles - A progress report
[AIAA PAPER 86-1629] p 627 A86-42762
Computation of the transonic flow about a swept wing in the presence of an engine nacelle
[NASA-CR-177113] p 630 N86-28911
**NASTRAN**
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463
**NAVIER-STOKES EQUATION**
Computation of two-dimensional transonic cascade flow using a new Navier-Stokes solver
[AIAA PAPER 86-1381] p 624 A86-42605
Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code
[AIAA PAPER 86-1426] p 624 A86-42635
Simulation of engine installation flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-1537] p 671 A86-42699
Numerical Navier-Stokes solutions of high speed propeller flows
[AIAA PAPER 86-1538] p 626 A86-42700
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88228] p 630 N86-28062
**NAVIGATION**
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172593] p 636 N86-28074
The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939
An investigation of TNAV equipped aircraft in a simulated en route metering environment
[NASA-CR-178031] p 641 N86-28940
**NAVIGATION AIDS**
Integrated navigation, communication, and surveillance systems based on standard distance measuring equipment p 635 A86-40116
Properties, applications, future of European gyro sensors p 676 N86-29082
**NAVIGATION INSTRUMENTS**
Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage
[DOT/FAA/PM-86/25,1] p 642 N86-28944
**NEAR FIELDS**
Experimental study using nearfield acoustic holography of sound transmission through fuselage sidewall structures
[NASA-CR-177162] p 683 N86-28702
**NICKEL ALLOYS**
Influence of molybdenum, tungsten, and cobalt on the corrosion of high-temperature strength nickel alloys in molten salts p 663 A86-41986
New vistas in the determination of hydrogen in aerospace engine metal alloys
[AIAA PAPER 86-1479] p 663 A86-42665
**NOISE PREDICTION (AIRCRAFT)**
Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 682 A86-41689
The influence of source location on the structural-acoustic interaction of cylinders --- in aerodynamics p 638 A86-41710
Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726
Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study
[NASA-TM-87747] p 683 N86-29632
**NOISE PROPAGATION**
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study
[NASA-TM-87747] p 683 N86-29632
**NOISE REDUCTION**
Counter-rotation prop-fan optimization
[AIAA PAPER 86-1470] p 645 A86-42659
Experimental study using nearfield acoustic holography of sound transmission through fuselage sidewall structures
[NASA-CR-177162] p 683 N86-28702
**NOISE SPECTRA**
Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study
[NASA-TM-87747] p 683 N86-29632
**NONDESTRUCTIVE TESTS**
Robotic nondestructive inspection of aerospace structures p 668 A86-40509
Probability of detection of flaws in a gas turbine engine component using electric current perturbation
p 669 A86-41574
Application of a computer model to electric current perturbation probe design p 669 A86-41576
Automatic eddy current inspection of antirotation windows in F100 engine compressor air seals
p 669 A86-41581
Automatic eddy current hole centering for aircraft engine components p 670 A86-41582
An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41596
A fiber optic damage monitor p 670 A86-41605
Application of medical computed tomography (CT) scanners to advanced aerospace composites
p 670 A86-41631
Prospects for intelligent aerospace structures
[AIAA PAPER 86-1139] p 672 A86-43328
**NONLINEAR SYSTEMS**
The design of a sliding mode controller for dutch roll damping in a non-linear aircraft system
p 651 A86-40766
Nonlinear control of aircraft
[NASA-TM-89225] p 655 N86-28958
**NONLINEARITY**
Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240
Multivariable control systems with saturating actuators antireset windup strategies
[NASA-CR-177100] p 682 N86-29580
**NOZZLE DESIGN**
Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models
[AIAA PAPER 86-1595] p 647 A86-42737
A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751
Initial performance evaluation of 2DCD ejector exhaust systems --- two dimensional convergent-divergent
[AIAA PAPER 86-1615] p 626 A86-42753
**NOZZLE FLOW**
Calculation of annular nozzle trisonic flowfields by the method of characteristics
[AIAA PAPER 86-1519] p 625 A86-42686
Investigation of the structure of a supersonic jet issuing from a free-vortex nozzle by means of pulsed holographic interferometry p 628 A86-43403

**NOZZLE GEOMETRY**
Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947

**NUCLEAR EXPLOSIONS**
Response of an operational turbofan engine to a simulated nuclear blast p 643 A86-40728

**NUMERICAL ANALYSIS**
Geometry definition and grid generation for a complete fighter aircraft
[NASA-TM-88242] p 622 N86-28050

**NUMERICAL CONTROL**
An expert system for control system design
p 680 A86-40774

**NUMERICAL FLOW VISUALIZATION**
Numerical study of the trailing edge region in slip flow regime p 624 A86-42548

**NUMERICAL INTEGRATION**
Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240

**NYQUIST DIAGRAM**
On the relationship between robustness tests and their application to helicopter control system designs
p 652 A86-40771

## O

**OBLIQUE WINGS**
Eigenstructure synthesis of an oblique wing flight control system p 652 A86-42913

**OCEAN SURFACE**
Elimination of directional wave spectrum contamination from noise in elevation measurements
p 641 A86-40854

**OILS**
Development of a portable wear metal analyzer for field use
[AD-A166013] p 622 N86-28906

**ONBOARD EQUIPMENT**
Prospects for intelligent aerospace structures
[AIAA PAPER 86-1139] p 672 A86-43328

**OPERATING COSTS**
Turboprop and open rotor propulsion for the future
[AIAA PAPER 86-1472] p 645 A86-42660

**OPTICAL HETERODYNING**
Speckle effects on coherent laser radar detection efficiency p 668 A86-40403

**OPTICAL MEASUREMENT**
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375
Improvement in the quality of flow visualization in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87730] p 675 N86-28389

**OPTICAL RADAR**
Speckle effects on coherent laser radar detection efficiency p 668 A86-40403

**OPTICAL TRACKING**
Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782

**OPTIMAL CONTROL**
Computer aided control system design using a multiobjective optimization approach
p 679 A86-40760
A design approach to a performance seeking control --- for fighter aircraft engines
[AIAA PAPER 86-1674] p 652 A86-42785
A differential dynamic programming method with an abrupt penalty integrand for solving tolerance problems
p 680 A86-42877
Optimal cooperative control synthesis of active displays
[NASA-177102] p 683 N86-29651

**OPTIMIZATION**
Airfoil optimization p 623 A86-40107
Dual-wing systems with decalage angle optimization
p 624 A86-40121
A study of optimizing cutting tool performance in high tensile strength materials p 668 A86-40527
Computer aided control system design using a multiobjective optimization approach
p 679 A86-40760
The OASIS structural optimization system
p 672 A86-43090
The use of mathematical optimization techniques by the designer
[NLR-MP-85005-U] p 682 N86-28673

**ORBITAL MANEUVERING VEHICLES**
An Orbital Maneuvering Vehicle simulator
p 658 A86-40515

**ORDNANCE**
Laser metalworking technology transfer
[AD-A165808] p 664 N86-28168

**ORTHOTROPIC PLATES**
Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715

**OSCILLATIONS**
Critical evaluation of the unsteady aerodynamics approach to dynamic stability at high angles of attack
[NASA-CR-177104] p 632 N86-28924

## P

**PANEL FLUTTER**
Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715

**PANEL METHOD (FLUID DYNAMICS)**
VSAERO analysis of a wing/pylon/nacelle configuration
[AIAA PAPER 86-1523] p 625 A86-42689
A numerical analysis applied to high angle of attack three-dimensional inlets
[AIAA PAPER 86-1527] p 627 A86-42760
The use of a panel code on high lift configurations of a swept forward wing
[NASA-CR-176968] p 631 N86-28916

**PANELS**
Experimental study using nearfield acoustic holography of sound transmission through fuselage sidewall structures
[NASA-CR-177162] p 683 N86-28702

**PARTIAL DIFFERENTIAL EQUATIONS**
Nonlinear control of aircraft
[NASA-TM-89225] p 655 N86-28958

**PARTICLE TRAJECTORIES**
Effect of particle characteristics on trajectories and blade impact patterns p 643 A86-40731
Dilute gas-particle flow in a centrifugal compressor impeller p 668 A86-40733
Particle trajectories in full 3D flow field of turbomachinery p 669 A86-40734

**PARTICULATE SAMPLING**
Sampling of solid particles in clouds
p 668 A86-40720

**PASSENGER AIRCRAFT**
Beech's enterprising Starship p 637 A86-40471
Which transport technologies will fly?
p 621 A86-41037
Counter-rotation prop-fan optimization
[AIAA PAPER 86-1470] p 645 A86-42659
UHB technology flight validation program --- Ultra High Bypass engines for large passenger aircraft
[AIAA PAPER 86-1473] p 656 A86-42661

**PAVEMENTS**
Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria
[DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

**PENALTY FUNCTION**
A differential dynamic programming method with an abrupt penalty integrand for solving tolerance problems
p 680 A86-42877

**PERFORMANCE**
Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 p 642 A86-40726
Compressor erosion and performance deterioration
p 643 A86-40727
Study of single stage axial flow compressor performance deterioration p 643 A86-40735
Performance deterioration during rotating stall in axial compressors p 644 A86-40738

**PERFORMANCE PREDICTION**
Prediction of fouled compressor performance using stage stacking techniques p 643 A86-40732
Turbine airfoil LCF life prediction verification
[AIAA PAPER 86-1496] p 646 A86-42672
Prediction of the stability performance of a turboreactor combustion chamber
[SNECMA-YKC-3[illegible]/85] p 651 N86-28949

**PERFORMANCE TESTS**
Composite materials: Testing and design; Proceedings of the Seventh Conference, Philadelphia, PA, April 2-4, 1984 p 662 A86-41051
Initial performance evaluation of 2DCD ejector exhaust systems --- two dimensional convergent-divergent
[AIAA PAPER 86-1615] p 626 A86-42753
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[NASA-TM-88218] p 629 N86-28056

**PERIPHERAL VISION**
Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782

**PILOT ERROR**
Aircraft accident report: China Airlines Boeing 747-SP, N4522V 300 nautical miles northwest of San Francisco, California, February 19, 1985
[PB86-910403] p 634 N86-28069

**PILOT PERFORMANCE**
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092

**PILOT TRAINING**
Flight simulator upgrades and modifications
p 655 A86-40477

**PITCH (INCLINATION)**
Multiaxis aircraft control power from thrust vectoring at high angles of attack
[NASA-TM-87741] p 629 N86-28054
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
First order analysis of the effect of pitching on the drag coefficient
[DE86-006324] p 633 N86-28926

**PLANFORMS**
A theoretical study of deltoid planforms operating in the ground effect region p 638 A86-41977

**PLASTIC AIRCRAFT STRUCTURES**
Design of a carbon-fiber reinforced wing for the Alpha-Jet major panel tests p 638 A86-41692
Characterisation and influence of orientation and internal stress in acrylic aircraft materials --- windows, canopies, PMMA
[NPL-DMA(A)113] p 665 N86-28193

**PLASTIC DEFORMATION**
Constitutive modeling of cyclic plasticity and creep, using an internal time concept p 670 A86-41673
Effects of unfavorable environmental conditions on the service life of jet engine and helicopter bearings
p 677 N86-29238

**PLUMES**
Dynamic pressure loads associated with twin supersonic plume resonance
[AIAA PAPER 86-1539] p 646 A86-42701

**PNEUMATIC CONTROL**
Apparatus for the preparation of air
[AD-A165603] p 673 N86-28266

**POLYGONS**
Features of the flow structure around polygonal lifting bodies at supersonic velocities p 628 A86-43421

**POLYIMIDES**
Process for preparing essentially colorless polyimide film containing phenoxy-linked diamines
[NASA-CASE-LAR-13353-1] p 666 N86-29039

**POLYMER MATRIX COMPOSITES**
Technical status and future prospects of carbon fibres and their application in composites with polymer matrix (CFRPs) p 661 A86-40488

**POLYMERIC FILMS**
Process for preparing essentially colorless polyimide film containing phenoxy-linked diamines
[NASA-CASE-LAR-13353-1] p 666 N86-29039

**POLYMETHYL METHACRYLATE**
Characterisation and influence of orientation and internal stress in acrylic aircraft materials --- windows, canopies, PMMA
[NPL-DMA(A)113] p 665 N86-28193

**POROUS MATERIALS**
Generalization of experimental data on the internal hydraulic resistance of laminated porous materials
p 650 A86-43383

**POSITION (LOCATION)**
Siting criteria for Microwave Landing Systems (MLS)
[FAA/PM-86/18] p 636 N86-28073

**POSITIONING**
Automatic eddy current hole centering for aircraft engine components p 670 A86-41582

**POTENTIAL FLOW**
A numerical analysis applied to high angle of attack three-dimensional inlets
[AIAA PAPER 86-1527] p 627 A86-42760
Multi-stage compressor airfoil aerodynamics. I - Airfoil potential flow analysis
[AIAA PAPER 86-1744] p 627 A86-42822

**POWER CONDITIONING**
Digital simulation of regulated electrical power supplies for military applications p 669 A86-40775

**POWER EFFICIENCY**
A new generation T56 turboprop engine
p 642 A86-40133

**PRECIPITATION HARDENING**
Effect of precipitation on mechanical properties of Al-Li-Cu-Mg-Zr alloy p 661 A86-40306

**PREDICTION ANALYSIS TECHNIQUES**
Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060
Probabilistic damage tolerance analysis of aircraft structures
[FFA-TN-1985-68] p 640 N86-28081

A study of the factors affecting boundary layer two-dimensionality in wind tunnels
[NASA-CR-177023] p 631 N86-28914

A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919

An experimental and analytical investigation of isolated rotor flap-lag stability in forward flight
[NASA-CR-177026] p 654 N86-28957

**PRESSURE DISTRIBUTION**

A computational fluid dynamics evaluation of test cell recirculation effects on high-bypass turbofan engine surface pressure distributions
[AIAA PAPER 86-1384] p 655 A86-42606

VSAERO analysis of a wing/pylon/nacelle configuration
[AIAA PAPER 86-1523] p 625 A86-42689

Comparison of theoretical and flight-measured local flow aerodynamics for a low-aspect-ratio fin
[NASA-CR-176995] p 632 N86-28920

Design of transonic airfoils with given pressure, subject to geometric constraints
[NLR-TR-84064-U] p 633 N86-28928

**PRESSURE DRAG**

An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064

**PRESSURE EFFECTS**

An analysis of blade vortex interaction aerodynamics and acoustics
[NASA-CR-177016] p 630 N86-28912

**PRESSURE MEASUREMENT**

NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076

Evaluation of a quartz bourdon pressure gage of wind tunnel Mach number control system application
[NASA-TM-88991] p 677 N86-29198

**PRESSURE OSCILLATIONS**

Dynamic pressure loads associated with twin supersonic plume resonance
[AIAA PAPER 86-1539] p 646 A86-42701

Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240

Large eddy simulations of flow in a ramjet combustor
p 659 N86-28241

**PRESSURE PULSES**

A novel feedback concept for combustion instability in ramjets p 665 N86-28236

**PROBABILITY DENSITY FUNCTIONS**

Probability of detection of flaws in a gas turbine engine component using electric current perturbation
p 669 A86-41574

**PROBABILITY THEORY**

Probabilistic damage tolerance analysis of aircraft structures
[FFA-TN-1985-68] p 640 N86-28081

**PRODUCT DEVELOPMENT**

'Alithalite' alloys - Progress, products and properties
p 660 A86-40256

**PRODUCTION ENGINEERING**

Laser metalworking technology transfer
[AD-A165808] p 664 N86-28168

**PROP-FAN TECHNOLOGY**

Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726

Counter-rotation prop-fan optimization
[AIAA PAPER 86-1470] p 645 A86-42659

Turbofan and propfan as basis for future economic propulsion concepts
[AIAA PAPER 86-1474] p 645 A86-42662

A report on the initial testing of the large scale advanced prop-fan
[AIAA PAPER 86-1551] p 647 A86-42708

Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709

Propfan test assessment (PTA) quick engine change (QEC) nacelle
[AIAA PAPER 86-1626] p 648 A86-42759

Correlation of theory and experiment for propfan inlets
[AIAA PAPER 86-1628] p 627 A86-42761

Aeritalia: Avionics, optoelectronics research, ATR 42
p 642 N86-29080

Experimental classical flutter reesults of a composite advanced turboprop model
[NASA-TM-88792] p 678 N86-29271

**PROPELLANT TANKS**

Development of a reusable, flight-weight cryogenic foam insulation system
[AIAA PAPER 86-1189] p 658 A86-40612

**PROPELLER BLADES**

Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726

A report on the initial testing of the large scale advanced prop-fan
[AIAA PAPER 86-1551] p 647 A86-42708

Theory of the motion of propeller blades for large displacements p 639 A86-43385

Experimental classical flutter reesults of a composite advanced turboprop model
[NASA-TM-88792] p 678 N86-29271

**PROPELLER EFFICIENCY**

A supersonic fan equipped variable cycle engine for a Mach 2.7 supersonic transport
[NASA-CR-177141] p 650 N86-28946

**PROPELLER SLIPSTREAMS**

An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064

**PROPELLERS**

Numerical Navier-Stokes solutions of high speed propeller flows
[AIAA PAPER 86-1538] p 626 A86-42700

Theoretical and experimental analysis of highspeed propeller aerodynamics
[AIAA PAPER 86-1549] p 626 A86-42706

Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709

An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064

NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463

Interaction of airborne and structureborne noise radiated by plates. Volume 1: Analytical study
[NASA-TM-87746] p 683 N86-29633

**PROPULSION SYSTEM CONFIGURATIONS**

Turbofan and propfan as basis for future economic propulsion concepts
[AIAA PAPER 86-1474] p 645 A86-42662

Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems
[AIAA PAPER 86-1545] p 638 A86-42704

Solid fuel gas generator air --- Air TurboRamjet
[AIAA PAPER 86-1682] p 649 A86-42792

**PROTECTIVE COATINGS**

Protective coating systems for high-temperature gas turbine components; Proceedings of the Conference, London, England, November 13, 14, 1984
p 664 A86-43134

Use of protective coatings in aero gas turbine engines
p 664 A86-43147

Thermal stability of gas turbine blades with protective coatings p 673 A86-43410

The future of surface treatments in aeronautical construction
[SNIAS-861-551-101] p 665 N86-29037

Process for preparing essentially colorless polyimide film containing phenoxy-linked diamines
[NASA-CASE-LAR-13353-1] p 666 N86-29039

**PROTOTYPES**

Development of a portable wear metal analyzer for field use
[AD-A166013] p 622 N86-28906

VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119

**PURSUIT TRACKING**

An analysis of a four state model for pursuit-evasion games --- during air combat p 680 A86-42957

**PYLONS**

VSAERO analysis of a wing/pylon/nacelle configuration
[AIAA PAPER 86-1523] p 625 A86-42689

## Q

**QUANTUM MECHANICS**

New alloys from the quantum engineer
p 663 A86-42424

## R

**RADAR APPROACH CONTROL**

A comparison of the effects of two traffic alert and collision avoidance systems (TCAS 3 and TCAS 2) on the performance of the Air Traffic Control Radar Beacon System
[DOT/FAA/PM-86/8] p 636 N86-28930

**RADAR CROSS SECTIONS**

Incoherent imaging of radar targets
p 667 A86-40215

**RADAR DATA**

Flightpath reconstruction and systematic radar error estimation from multi-radar range-azimuth measurements
p 636 A86-42966

**RADAR DETECTION**

Speckle effects on coherent laser radar detection efficiency p 668 A86-40403

**RADAR ECHOES**

Incoherent imaging of radar targets
p 667 A86-40215

**RADAR IMAGERY**

Incoherent imaging of radar targets
p 667 A86-40215

**RADAR MEASUREMENT**

Elimination of directional wave spectrum contamination from noise in elevation measurements
p 641 A86-40854

**RADAR TARGETS**

Incoherent imaging of radar targets
p 667 A86-40215

**RADAR TRACKING**

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695

**RADIAL FLOW**

Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947

**RADIATION ABSORPTION**

Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers
[NASA-TM-87333] p 683 N86-29630

**RADIO COMMUNICATION**

Radio telephony - A case for growing concern
p 635 A86-40569

Language problems in air traffic control
p 635 A86-40570

**RAMJET ENGINES**

Solid fuel gas generator air --- Air TurboRamjet
[AIAA PAPER 86-1682] p 649 A86-42792

A novel feedback concept for combustion instability in ramjets p 665 N86-28236

The flowfield of a side-dump combustor
p 673 N86-28237

Flame driving of longitudinal instabilities in dump type ramjet combustors p 658 N86-28239

Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240

Large eddy simulations of flow in a ramjet combustor
p 659 N86-28241

Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242

**RAREFIED GAS DYNAMICS**

Numerical study of the trailing edge region in slip flow regime p 624 A86-42548

**RAYLEIGH EQUATIONS**

Eigenvalue reanalysis of locally modified structures using a generalized Rayleigh's method
[AIAA PAPER 84-0972] p 670 A86-41714

**REAL TIME OPERATION**

The future of bipolar technology for avionics
p 674 N86-28341

In-flight thrust determination on a real-time basis
[NASA-CR-176997] p 641 N86-28937

**RECIRCULATIVE FLUID FLOW**

A computational fluid dynamics evaluation of test cell recirculation effects on high-bypass turbofan engine surface pressure distributions
[AIAA PAPER 86-1384] p 655 A86-42606

**RECTANGULAR PANELS**

Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715

**RECTANGULAR WINGS**

Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922

A theory for lateral wing-tip blowing
[NASA-CR-176931] p 632 N86-28923

**REFLECTION**

Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria
[DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

**REFRACTORY COATINGS**

Protective coating systems for high-temperature gas turbine components; Proceedings of the Conference, London, England, November 13, 14, 1984
p 664 A86-43134

**REFRACTORY METALS**

Influence of molybdenum, tungsten, and cobalt on the corrosion of high-temperature strength nickel alloys in molten salts p 663 A86-41988

**REGULATIONS**

Computerisation of air information services in France
p 635 A86-40229

**REINFORCED PLATES**

Optimal design of antisymmetric laminated composite plates p 667 A86-40109

**RELAXATION METHOD (MATHEMATICS)**
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88226] p 630 N86-28062
**RELIABILITY ANALYSIS**
An experiment in software reliability
[NASA-CR-172553] p 682 N86-29547
**RELIABILITY ENGINEERING**
R&M 2000 - A look to the future --- Air Force Reliability and Maintainability
[AIAA PAPER 86-1668] p 672 A86-42781
**REMOTELY PILOTED VEHICLES**
The design of a sliding mode controller for dutch roll damping in a non-linear aircraft system
p 651 A86-40766
**REQUIREMENTS**
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236
**RESEARCH AND DEVELOPMENT**
Technical status and future prospects of carbon fibres and their application in composites with polymer matrix (CFRPs) p 661 A86-40488
High performance, stratified charge rotary engines for general aviation
[AIAA PAPER 86-1553] p 647 A86-42710
**RESEARCH MANAGEMENT**
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085
**RESEARCH VEHICLES**
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172593] p 636 N86-28074
**RESIDUAL STRESS**
A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes
p 662 A86-40575
Characterisation and influence of orientation and internal stress in acrylic aircraft materials --- windows, canopies, PMMA
[NPL-DMA(A)113] p 665 N86-28193
**RESONANT FREQUENCIES**
Optical determination of the effects of a microminiature accelerometer on resonance of a small airfoil
p 668 A86-40712
Advances in aero engine dynamics
[AIAA PAPER 86-1677] p 648 A86-42788
**RESONANT VIBRATION**
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105
Linear and nonlinear dynamic analysis of redundant load path bearingless rotor systems
[NASA-CR-177096] p 682 N86-29579
**REVERSED FLOW**
Reverse flow in multistage axial compressors
[AIAA PAPER 86-1747] p 627 A86-42825
**ROBOTICS**
Robotic nondestructive inspection of aerospace structures p 668 A86-40509
**ROBUSTNESS (MATHEMATICS)**
On the relationship between robustness tests and their application to helicopter control system designs
p 652 A86-40771
Robust simplified adaptive control for a class of multivariable continuous-time systems
p 680 A86-42860
Integrated control - A decentralized approach
p 681 A86-42996
Multivariable control of a twin lift helicopter system using the LQG/LTR design methodology
[NASA-CR-177025] p 654 N86-28956
**ROLL**
Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693
Eigenstructure assignment, eigensensitivity, and flight control design p 680 A86-42912
**ROLL FORMING**
Textures developed in Al-Li-Cu-Mg alloy
p 660 A86-40291
**ROLLER BEARINGS**
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236
Design and calculation of high speed engine bearings
p 677 N86-29241
**ROTARY ENGINES**
High performance, stratified charge rotary engines for general aviation
[AIAA PAPER 86-1553] p 647 A86-42710
**ROTARY STABILITY**
Advances in aero engine dynamics
[AIAA PAPER 86-1677] p 648 A86-42788
**ROTARY WING AIRCRAFT**
Rotorcraft propulsion for year 2000 plus
[AIAA PAPER 86-1543] p 646 A86-42702
Small engine technology payoffs for future commuter aircraft
[AIAA PAPER 86-1544] p 646 A86-42703
Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935
Investigation of an advanced fault tolerant integrated avionics system
[NASA-CR-176960] p 642 N86-28945
Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947
**ROTARY WINGS**
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361
Helicopter rotor and engine sizing for preliminary performance estimation
[AIAA PAPER 86-1756] p 638 A86-42829
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
Individual-blade-control research in the MIT VTOL Technology Laboratory 1977-1985
[NASA-CR-177121] p 654 N86-28954
**ROTATING ENVIRONMENTS**
Laser fringe anemometry for aero engine components
[NASA-TM-88798] p 629 N86-28053
**ROTATING STALLS**
Performance deterioration during rotating stall in axial compressors p 644 A86-40738
**ROTOR AERODYNAMICS**
Theoretical and experimental analysis of highspeed propeller aerodynamics
[AIAA PAPER 86-1549] p 626 A86-42706
Knowledge-based systems for rotordynamic diagnostics
[AIAA PAPER 86-1678] p 648 A86-42789
Multi-stage compressor airfoil aerodynamics. I - Airfoil potential flow analysis
[AIAA PAPER 86-1744] p 627 A86-42822
Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[NASA-TM-86828] p 639 N86-28079
**ROTOR BLADES (TURBOMACHINERY)**
Experience with laboratory LDA by measuring flow fields in rotating turbomachinery p 672 A86-43109
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[NASA-TM-86828] p 639 N86-28079
A supersonic fan equipped variable cycle engine for a Mach 2.7 supersonic transport
[NASA-CR-177141] p 650 N86-28946
An experimental and analytical investigation of isolated rotor flap-lag stability in forward flight
[NASA-CR-177028] p 654 N86-28957
**ROTOR BODY INTERACTIONS**
Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[NASA-TM-86828] p 639 N86-28079
**ROTOR SYSTEMS RESEARCH AIRCRAFT**
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917
**ROTORCRAFT AIRCRAFT**
Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems
[AIAA PAPER 86-1545] p 638 A86-42704
**ROTORS**
Improved compressor performance using recessed clearance (trenches) over the rotor
[AIAA PAPER 86-1745] p 649 A86-42823
Laser fringe anemometry for aero engine components
[NASA-TM-88798] p 629 N86-28053
**ROUTES**
An investigation of TNAV equipped aircraft in a simulated en route metering environment
[NASA-CR-178031] p 641 N86-28940
**RUNWAYS**
Runway requirements in instrument flight traffic at regional airports and commercial landing areas
p 635 A86-41873
Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria
[DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

**SAFETY FACTORS**
STOLport London - A design for safety
p 655 A86-40226
**SAFETY MANAGEMENT**
The market price for air safety p 633 A86-40228
**SATELLITE NETWORKS**
Future Aeronautical Communication System (FACS): Report
[ESA-86-96959] p 673 N86-28309
**SATELLITE OBSERVATION**
System and technology considerations for space-based air traffic surveillance
[AIAA PAPER 86-1170] p 658 A86-40581
**SCHEDULING**
Time-based air traffic management using expert systems
[NASA-TM-88234] p 634 N86-28068
**SCHOOLS**
Propulsion education at the Air Force Institute of Technology
[AIAA PAPER 86-1754] p 684 A86-42827
**SELF ADAPTIVE CONTROL SYSTEMS**
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft
[NASA-TM 87706] p 675 N86-28385
**SEMICONDUCTOR DEVICES**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337
The future of bipolar technology for avionics
p 674 N86-28341
**SEMICONDUCTORS (MATERIALS)**
Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys
[PB86-184314] p 665 N86-28186
**SENSITIVITY**
Eigenstructure assignment, eigensensitivity, and flight control design p 680 A86-42912
**SEPARATED FLOW**
A numerical analysis applied to high angle of attack three-dimensional inlets
[AIAA PAPER 86-1527] p 627 A86-42760
**SERVICE LIFE**
Substantiation of regimes for accelerated equivalent tests of gas-turbine aeroengines p 644 A86-41549
Turbine airfoil LCF life prediction verification
[AIAA PAPER 86-1496] p 646 A86-42672
**SHARP LEADING EDGES**
The lift of sharp-leading-edged delta wings with blowing
[NASA-CR-176967] p 631 N86-28915
**SHEAR STRESS**
Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052
A study of the factors affecting boundary layer two-dimensionality in wind tunnels
[NASA-CR-177023] p 631 N86-28914
**SHELL THEORY**
Response of composite material shallow arch to concentrated load p 670 A86-41699
**SHOCK WAVE INTERACTION**
Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261
Mathematical model of the interaction of a single unsteady supersonic jet with a moving barrier of finite size p 628 A86-43401
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173
**SHOCK WAVES**
A novel feedback concept for combustion instability in ramjets p 665 N86-28236
**SHORT TAKEOFF AIRCRAFT**
STOLport London - A design for safety
p 655 A86-40226
Aerodynamics of the Viggen 37 aircraft. Part 1: General characteristics at low speed
[NASA-TM-88403] p 632 N86-28925
Multi-input, multi-output system control for experimental aircraft
[NASA-CR-177017] p 654 N86-28955
Optical technology for flight control systems
[NASA-TM-88400] p 655 N86-28960
**SHROUDED NOZZLES**
Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947

**SIDESLIP**
Wake shape and its effects on aerodynamic characteristics
[NASA-CR-176118] p 631 N86-29918
**SIGNAL ANALYSIS**
An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41506
**SIGNAL PROCESSING**
Weibull-distributed ground clutter in the frequency domain p 671 A86-41863
The future of bipolar technology for avionics
p 674 N86-28341
Mil-DAP: Its architecture and role as a real time airborne digital signal processor p 681 N86-28359
Multivariable control systems with saturating actuators antireset windup strategies
[NASA-CR-177100] p 682 N86-29580
**SIGNAL TRANSMISSION**
Optical technology for flight control systems
[NASA-TM-88400] p 655 N86-28960
**SILANES**
Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610
**SILICON**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337
**SINKS**
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176906] p 676 N86-29159
**SIZE (DIMENSIONS)**
Layout of electrical equipment on an aircraft with allowance for equipment size constraints in the framework of computer-aided design p 639 A86-43389
**SIZE DETERMINATION**
Computer sizing of fighter aircraft
[AIAA PAPER 85-0212] p 637 A86-40106
**SIZING**
Helicopter rotor and engine sizing for preliminary performance estimation
[AIAA PAPER 86-1756] p 638 A86-42829
**SKIN (STRUCTURAL MEMBER)**
A new approach to durability prediction for fuel tank skins -- aircraft industry p 642 A86-40119
**SKIN FRICTION**
Experimental investigation of the turbulent boundary layer at high Reynolds numbers and a Mach number of 0.8 p 624 A86-42168
**SLENDER WINGS**
Ground effect on slender wings at moderate and high angles of attack p 623 A86-40108
**SLIP FLOW**
Numerical study of the trailing edge region in slip flow regime p 624 A86-42548
**SOFTWARE ENGINEERING**
An experiment in software reliability
[NASA-CR-172553] p 682 N86-29547
**SOUND TRANSMISSION**
A study on the transmission of sound through flow ducts of varying cross section
[NLR-TR-83128-U] p 683 N86-29636
**SOUND WAVES**
Large eddy simulations of flow in a ramjet combustor
p 659 N86-28241
Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242
Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers
[NASA-TM-87333] p 683 N86-29630
**SPACE SHUTTLE ORBITERS**
New applications of mu to real-parameter variation problems --- structured singular value theory for flight control systems stability analysis p 680 A86-42871
**SPACE SURVEILLANCE (GROUND BASED)**
Integrated navigation, communication, and surveillance systems based on standard distance measuring equipment p 635 A86-40116
**SPACECRAFT CONSTRUCTION MATERIALS**
Experiences in FRG in aerospace application --- of carbon fiber reinforced plastics p 661 A86-40498
Experiences in UK and France in aerospace application --- of glass and carbon fiber reinforced composites
p 621 A86-40499
**SPACECRAFT CONTROL**
Failure detection and accommodation in structural dynamics systems using analytic redundancy --- in large space structures p 658 A86-42938
**SPACECRAFT DESIGN**
Activities report in aerospace research
[ESA-86-97190] p 622 N86-28907
**SPACECRAFT PROPULSION**
Propulsion education at the Air Force Institute of Technology
[AIAA PAPER 86-1754] p 684 A86-42827
**SPACECRAFT RELIABILITY**
A new approach to durability prediction for fuel tank skins --- aircraft industry p 642 A86-40119
**SPACECRAFT STRUCTURES**
Robotic nondestructive inspection of aerospace structures p 668 A86-40509
Prospects for intelligent aerospace structures
[AIAA PAPER 86-1139] p 672 A86-43326
**SPANWISE BLOWING**
Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922
A theory for lateral wing-tip blowing
[NASA-CR-176931] p 632 N86-28923
**SPATIAL RESOLUTION**
The calculation of the entropy distribution along cloud traverses using aircraft measurements
p 678 A86-40555
**SPECKLE PATTERNS**
Speckle effects on coherent laser radar detection efficiency p 668 A86-40403
**SPLINES**
Aero-engine gears: Manufacturing cracks and their effect on operation p 677 N86-29239
**SPRAY CHARACTERISTICS**
Characterization of fuel sprays using a high-resolution patternator
[AIAA PAPER 86-1726] p 686 A86-42814
**STANDARDIZATION**
Chemical control for Airbus composites. HPLC standardization
[I-104/84] p 664 N86-28133
**STATIC STABILITY**
NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076
**STATISTICAL ANALYSIS**
Annual review of aircraft accident data. US air carrier operations: Calendar year 1982
[PB86-212529] p 634 N86-28929
**STEELS**
Direction of R and D and current status of understanding of advanced gear steels p 666 N86-29245
**STEERABLE ANTENNAS**
Future Aeronautical Communication System (FACS): Report
[ESA-86-96969] p 673 N86-28309
**STRAIN GAGES**
Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2)
[NASA-TM-87677] p 639 N86-28075
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080
**STRAPS**
Aircraft barricade
[AD-D012194] p 656 N86-28102
**STRESS ANALYSIS**
Failure analysis of composite angle structures
p 667 A86-40353
Prospects for intelligent aerospace structures
[AIAA PAPER 86-1139] p 672 A86-43326
**STRESS CORROSION CRACKING**
Aero-engine gears: Manufacturing cracks and their effect on operation p 677 N86-29239
**STRESS CYCLES**
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29026
**STRESS INTENSITY FACTORS**
Stress intensity factor in an integral or bonded stiffened panel using an analytical method --- aircraft structures
[SNIAS-861-111-104] p 676 N86-28481
**STRESS-STRAIN-TIME RELATIONS**
Constitutive modeling of cyclic plasticity and creep, using an internal time concept p 670 A86-41673
**STRESSES**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344
**STROBOSCOPES**
A turbine engine inlet viewing system
[AIAA PAPER 86-1647] p 656 A86-42769
**STRUCTURAL ANALYSIS**
Eigenvalue reanalysis of locally modified structures using a generalized Rayleigh's method
[AIAA PAPER 84-0972] p 670 A86-41714
A large displacement formulation for anisotropic beam analysis p 671 A86-42075
Boundary layer model to compute the edge effects in stratified composite plates
[ONERA-RT-7/3542-RY-041-R] p 678 N86-29279
**STRUCTURAL DESIGN**
Optimal design of antisymmetric laminated composite plates p 667 A86-40109
The OASIS structural optimization system
p 672 A86-43090
Computing codes for development of helicopter crashworthy structures and test substantiation
[SNIAS-861-210-106] p 640 N86-28084
Stress intensity factor in an integral or bonded stiffened panel using an analytical method --- aircraft structures
[SNIAS-861-111-104] p 676 N86-28481
Properties, applications, future of European gyro sensors p 676 N86-29062
**STRUCTURAL DESIGN CRITERIA**
Damage tolerance assessment of aircraft attachment lugs p 672 A86-43084
Flow direction measurement criteria and techniques planned for the 40- by 80-/80- x 120-foot wind tunnel integrated systems tests
[NASA-CR-176969] p 676 N86-29152
**STRUCTURAL RELIABILITY**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344
**STRUCTURAL VIBRATION**
Advances in aero engine dynamics
[AIAA PAPER 86-1677] p 648 A86-42768
**STRUCTURAL WEIGHT**
Influence of structural changes on the fuel-consumption efficiency of a transport aircraft p 638 A86-43380
**STRUTS**
A numerical study of the aerodynamic interference of a model support system used in the RAE 5 metre wind tunnel
[AD-A166671] p 657 N86-28962
**SUBSONIC FLOW**
Experimental investigation of the turbulent boundary layer at high Reynolds numbers and a Mach number of 0.8 p 624 A86-42168
Effects of S-bends on diffuser internal performance and turbulence characteristics
[AIAA PAPER 86-1459] p 625 A86-42654
Rotational-translational subsonic motion of a finite-span wing in an ideal gas p 626 A86-43384
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463
**SUBSONIC SPEED**
Test and evaluation of the HIDEC engine uptrim algorithm
[NASA-TM-88202] p 650 N86-28088
**SUPERCRITICAL WINGS**
Extension of a transonic three-dimensional unsteady small perturbation computing method
[ONERA-RTS-23/3064-RY-048-R] p 633 N86-28927
**SUPERSONIC AIRCRAFT**
Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715
**SUPERSONIC COMBUSTION**
Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610
A detailed numerical model of a supersonic reacting mixing layer
[AIAA PAPER 86-1427] p 671 A86-42636
Effect of different hydrogen-injection techniques on its burnup in a supersonic air flow p 664 A86-43420
**SUPERSONIC COMBUSTION RAMJET ENGINES**
Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models
[AIAA PAPER 86-1595] p 647 A86-42737
**SUPERSONIC FLIGHT**
Effect of longitudinal-contour shape on the aerodynamic characteristics of lifting bodies at supersonic and hypersonic flight velocities p 626 A86-43402
**SUPERSONIC FLOW**
Numerical study of the trailing edge region in slip flow regime p 624 A86-42548
A detailed numerical model of a supersonic reacting mixing layer
[AIAA PAPER 86-1427] p 671 A86-42636
Application of laser-dual-focus velocimetry in a counterflow p 628 A86-43110
Solution of problems of conjugate heat transfer during flow past bodies of different shape p 673 A86-43370
Experimental study of supersonic flow around a single-stage wedge with cheeks at sideslip angles
p 626 A86-43404
Features of the flow structure around polygonal lifting bodies at supersonic velocities p 628 A86-43421
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173
**SUPERSONIC INLETS**
Effects of S-bends on diffuser internal performance and turbulence characteristics
[AIAA PAPER 86-1459] p 625 A86-42654

**SUPERSONIC JET FLOW**

Mathematical model of the interaction of a single unsteady supersonic jet with a moving barrier of finite size p 628 A86-43401

Investigation of the structure of a supersonic jet issuing from a free-vortex nozzle by means of pulsed holographic interferometry p 628 A86-43403

**SUPERSONIC NOZZLES**

Dynamic pressure loads associated with twin supersonic plume resonance [AIAA PAPER 86-1539] p 646 A86-42701

**SUPERSONIC WIND TUNNELS**

Transonic and supersonic wind tunnel tests on schematic missile configurations with two different nose lengths [FFA-TN-1984-62] p 630 N86-28066

**SUPPORT SYSTEMS**

A supportability strategy for 1995 [AIAA PAPER 86-1670] p 684 A86-42783

**SURFACE FINISHING**

Adhesive bonding of aluminium-lithium alloys p 660 A86-40267

The future of surface treatments in aeronautical construction [SNIAS-861-551-101] p 665 N86-29037

**SURFACE NAVIGATION**

Airport surface navigation and traffic control p 635 A86-40227

**SWEEPBACK**

NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems [NASA-CR-174967] p 675 N86-28463

**SWEPT FORWARD WINGS**

A forward-swept-wing fighter configuration designed by a transonic computational method p 638 A86-41696

The use of a panel code on high lift configurations of a swept forward wing [NASA-CR-176960] p 631 N86-28916

**SWEPT WINGS**

A report on the initial testing of the large scale advanced prop-fan [AIAA PAPER 86-1551] p 647 A86-42706

Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2) [NASA-TM-87677] p 639 N86-28075

A theory for lateral wing-tip blowing [NASA-CR-176931] p 632 N86-28923

Multivariable control of a forward swept wing aircraft [NASA-CR-177112] p 654 N86-28953

**SWEPTBACK WINGS**

Aircraft barricade [AD-D012194] p 656 N86-28102

Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model [NASA-TM-88442] p 657 N86-28964

**SYSTEM EFFECTIVENESS**

Sophistication and safety in a semi-automated air traffic control system p 635 A86-41874

**SYSTEM FAILURES**

Design issues for fault tolerant-restructurable aircraft control p 652 A86-42937

**SYSTEM IDENTIFICATION**

Application of system identification to aircraft flight test data processing p 638 A86-43002

**SYSTEMS ANALYSIS**

New applications of mu to real-parameter variation problems --- structured singular value theory for flight control systems stability analysis p 680 A86-42671

Investigation of an advanced fault tolerant integrated avionics system [NASA-CR-176980] p 642 N86-28945

**SYSTEMS ENGINEERING**

Failure detection and accommodation in structural dynamics systems using analytic redundancy --- in large space structures p 658 A86-42938

Development and validation of the crew-station system-integration research facility [NASA-TM-86841] p 622 N86-28051

**SYSTEMS INTEGRATION**

Integrated control - A decentralized approach p 681 A86-42996

Development and validation of the crew-station system-integration research facility [NASA-TM-86841] p 622 N86-28051

The integrated manual and automatic control of complex flight systems [NASA-CR-177066] p 654 N86-28952

Flow direction measurement criteria and techniques planned for the 40- by 80-/80- x 120-foot wind tunnel integrated systems tests [NASA-CR-176969] p 676 N86-29152

**SYSTEMS STABILITY**

Application of parameter estimation to highly unstable aircraft [NASA-TM-88266] p 639 N86-28078

## T

**T-56 ENGINE**

A new generation T56 turboprop engine p 642 A86-40133

**TAIL ASSEMBLIES**

Canard/tail comparison for an advanced variable-sweep-wing fighter p 637 A86-41686

Investigation of empennage buffeting [NASA-CR-177164] p 654 N86-28951

**TAIL SURFACES**

Wake shape and its effects on aerodynamic characteristics [NASA-CR-178118] p 631 N86-28918

**TAKEOFF**

Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112

CTOL ski jump - Analysis, simulation, and flight test p 637 A86-40113

**TARGET ACQUISITION**

A differential dynamic programming method with an abrupt penalty integrand for solving tolerance problems p 680 A86-42877

**TAXIING**

Airport surface navigation and traffic control p 635 A86-40227

**TECHNOLOGICAL FORECASTING**

Which transport technologies will fly? p 621 A86-41037

Small engine propulsion readiness for the 21st century [AIAA PAPER 86-1624] p 647 A86-42758

R&M 2000 - A look to the future --- Air Force Reliability and Maintainability [AIAA PAPER 86-1668] p 672 A86-42781

**TECHNOLOGY ASSESSMENT**

Flight simulator upgrades and modifications p 655 A86-40477

Simulator upgrade - Regulations and benefits p 621 A86-40478

Carbon fibres and their composites p 661 A86-40487

Technical status and future prospects of carbon fibres and their application in composites with polymer matrix (CFRPs) p 661 A86-40488

Using Derivative engine technology to achieve maturity goals [AIAA PAPER 86-1752] p 649 A86-42826

A perspective of computational fluid dynamics [NASA-TM-88246] p 629 N86-28057

Aeroflot officials roundtable on section's technical progress p 623 N86-28909

**TECHNOLOGY TRANSFER**

Laser metalworking technology transfer [AD-A165808] p 664 N86-28168

**TECHNOLOGY UTILIZATION**

Experiences in FRG in aerospace application --- of carbon fiber reinforced plastics p 661 A86-40498

Experiences in UK and France in aerospace application --- of glass and carbon fiber reinforced composites p 621 A86-40499

Aeroflot officials roundtable on section's technical progress p 623 N86-28909

**TELEPHONY**

Radio telephony - A case for growing concern p 635 A86-40569

Language problems in air traffic control p 635 A86-40570

**TELEVISION CAMERAS**

A turbine engine inlet viewing system [AIAA PAPER 86-1647] p 656 A86-42769

**TEMPERATURE DISTRIBUTION**

Redistribution of an inlet temperature distortion in an axial flow turbine stage [AIAA PAPER 86-1468] p 671 A86-42658

**TEMPERATURE EFFECTS**

The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344

**TEMPERATURE MEASUREMENT**

Further development of the dynamic gas temperature measurement system [AIAA PAPER 86-1648] p 672 A86-42770

**TEMPERATURE PROFILES**

Calculation of the characteristics of a multistage gas turbine with allowance for the circumferential nonuniformity of inlet temperature p 649 A86-43381

**TENSILE DEFORMATION**

Deformation and fracture in Al-Li base alloys p 661 A86-40312

**TENSILE PROPERTIES**

Effect of precipitation on mechanical properties of Al-Li-Cu-Mg-Zr alloy p 661 A86-40306

**TENSILE STRENGTH**

Deformation and fracture in Al-Li base alloys p 661 A86-40312

**TERMINAL FACILITIES**

Runway requirements in instrument flight traffic at regional airports and commercial landing areas p 635 A86-41873

**TEST FACILITIES**

Uniform engine testing program phase 7: NASA Lewis Research Center second entry [NASA-TM-87272] p 650 N86-28085

**TF-34 ENGINE**

Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model [NASA-TM-88218] p 629 N86-28056

**THERMAL CYCLING TESTS**

Effect of moisture on thermal properties of composite materials for aerospace applications p 661 A86-40345

**THERMAL ENVIRONMENTS**

Cryogenic wind tunnels: Problems of continuous operation at low temperatures [NASA-TM-88446] p 656 N86-28099

**THERMAL INSULATION**

Development of a reusable, flight-weight cryogenic foam insulation system [AIAA PAPER 86-1189] p 658 A86-40612

**THERMAL PROTECTION**

Process for preparing essentially colorless polyimide film containing phenoxy-linked diamines [NASA-CASE-LAR-13353-1] p 666 N86-29039

**THERMAL STABILITY**

Thermal stability of gas turbine blades with protective coatings p 673 A86-43410

**THERMOCOUPLES**

Further development of the dynamic gas temperature measurement system [AIAA PAPER 86-1648] p 672 A86-42770

**THERMODYNAMIC CYCLES**

Performance estimation of the mixed flow, afterburning, cooled, two-spool turbofan engine with bleed and power extraction [AIAA PAPER 86-1757] p 649 A86-42830

**THERMODYNAMIC PROPERTIES**

Effect of moisture on thermal properties of composite materials for aerospace applications p 661 A86-40345

**THERMOPLASTIC RESINS**

Thermoplastic composites - Design material of the 1990s? p 663 A86-41685

**THREE DIMENSIONAL FLOW**

Particle trajectories in full 3D flow field of turbomachinery p 669 A86-40734

Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261

A forward-swept-wing fighter configuration designed by a transonic computational method p 638 A86-41696

Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code [AIAA PAPER 86-1426] p 624 A86-42635

Simulation of engine installation flowfields using a three-dimensional Euler/Navier-Stokes algorithm [AIAA PAPER 86-1537] p 671 A86-42699

A comparison of computational methods for three-dimensional, turbulent turbomachinery flow fields [AIAA PAPER 86-1599] p 626 A86-42740

Extension of a transonic three-dimensional unsteady small perturbation computing method [ONERA-RTS-23/3064-RY-048-R] p 633 N86-28927

Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model [NASA-TM-88442] p 657 N86-28964

**THRESHOLDS (PERCEPTION)**

Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782

**THRUST MEASUREMENT**

In-flight thrust determination on a real-time basis [NASA-CR-176997] p 641 N86-28937

**THRUST REVERSAL**

Development of the Boeing 767 thrust reverser [AIAA PAPER 86-1536] p 646 A86-42698

**THRUST VECTOR CONTROL**

Multiaxis aircraft control power from thrust vectoring at high angles of attack [NASA-TM-87741] p 629 N86-28054

**THUNDERSTORMS**

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695

**TIDES**

Design technique to reduce effects of tidal variations on an ILS glide slope system p 635 A86-41335

**TIME**
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939
An investigation of TNAV equipped aircraft in a simulated en route metering environment
[NASA-CR-178031] p 641 N86-28940
**TIME DEPENDENCE**
Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049
**TIME LAG**
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092
**TITANIUM ALLOYS**
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29028
**TOLERANCES (MECHANICS)**
Damage tolerance assessment of aircraft attachment lugs p 672 A86-43084
**TORSIONAL STRESS**
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361
**TRAFFIC CONTROL**
Airport surface navigation and traffic control
p 635 A86-40227
**TRAILING EDGES**
Numerical study of the trailing edge region in slip flow regime p 624 A86-42548
Experimental analyses of trailing edge flows
[NASA-CR-176904] p 632 N86-28921
**TRAINING EVALUATION**
Flight simulator upgrades and modifications
p 655 A86-40477
Simulator upgrade - Regulations and benefits
p 621 A86-40478
**TRAINING SIMULATORS**
Simulator upgrade - Regulations and benefits
p 621 A86-40478
**TRAJECTORY MEASUREMENT**
Flightpath reconstruction and systematic radar error estimation from multi-radar range-azimuth measurements
p 638 A86-42966
**TRAJECTORY OPTIMIZATION**
An analysis of a four state model for pursuit-evasion games --- during air combat p 680 A86-42957
**TRANSATMOSPHERIC VEHICLES**
Mastering the transatmosphere p 658 A86-41274
**TRANSIENT RESPONSE**
Response of an operational turbofan engine to a simulated nuclear blast p 643 A86-40728
**TRANSITION FLOW**
Large and small structures in the computation of transition to fully developed turbulent flows
p 669 A86-41254
**TRANSMISSION LINES**
Interface of the transport systems research vehicle monochrome display system to the digital autonomous terminal access communication data bus
[NASA-TM-87728] p 656 N86-28961
**TRANSMISSIONS (MACHINE ELEMENTS)**
Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236
A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant p 666 N86-29242
Requirements on lubricatin oil from the view of a helicopter manufacturer p 666 N86-29244
Future trends in helicopter transmission lubricants
p 666 N86-29250
Scoring tests of aircraft transmission lubricants at high speeds and high temperatures p 667 N86-29253
**TRANSONIC FLOW**
Viscous effects on transonic airfoil stability and response p 623 A86-40110
Aerodynamic investigations toward an adaptive airfoil for a transonic transport aircraft p 623 A86-40115
Unsteady transonic flow calculations for interfering lifting surface configurations p 623 A86-40118
A forward-swept-wing fighter configuration designed by a transonic computational method p 638 A86-41696
Computation of two-dimensional transonic cascade flow using a new Navier-Stokes solver
[AIAA PAPER 86-1381] p 624 A86-42605
Design of transonic airfoils with given pressure, subject to geometric constraints
[NLR-TR-84064-U] p 633 N86-28928
Multivariable control of a forward swept wing aircraft
[NASA-CR-177112] p 654 N86-28953
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173
**TRANSONIC FLUTTER**
Extension of a transonic three-dimensional unsteady small perturbation computing method
[ONERA-RTS-23/3064-RY-048-R] p 633 N86-28927
**TRANSONIC SPEED**
Cryogenic wind tunnels: Problems of continuous operation at low temperatures
[NASA-TM-88446] p 656 N86-28099
**TRANSONIC WIND TUNNELS**
Transonic and supersonic wind tunnel tests on schematic missile configurations with two different nose lengths
[FFA-TN-1984-62] p 630 N86-28066
Improvement in the quality of flow visualization in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87730] p 675 N86-28369
Experimental analyses of trailing edge flows
[NASA-CR-176904] p 632 N86-28921
Evaluation of a quartz bourdon pressure gage of wind tunnel Mach number control system application
[NASA-TM-88991] p 677 N86-29198
**TRANSPARENCE**
New transparent solid material for helicopter windshields
[SNPE-NT-37/85/CRB/NP] p 641 N86-28941
Process for preparing essentially colorless polyimide film containing phenoxy-linked diamines
[NASA-CASE-LAR-13353-1] p 666 N86-29039
**TRANSPONDERS**
A comparison of the effects of two traffic alert and collision avoidance systems (TCAS 3 and TCAS 2) on the performance of the Air Traffic Control Radar Beacon System
[DOT/FAA/PM-86/8] p 636 N86-28930
**TRANSPORT AIRCRAFT**
Aerodynamic investigations toward an adaptive airfoil for a transonic transport aircraft p 623 A86-40115
Which transport technologies will fly?
p 621 A86-41037
Counter-rotation prop-fan optimization
[AIAA PAPER 86-1470] p 645 A86-42659
Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709
Influence of structural changes on the fuel-consumption efficiency of a transport aircraft p 638 A86-43380
An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172593] p 636 N86-28074
Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft
[NASA-CR-159251] p 639 N86-28077
**TRIBOLOGY**
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236
Tribology in aircraft systems: Basic principles and applications p 677 N86-29240
Aircraft engine oils and their behaviour at high temperatures p 667 N86-29251
**TURBINE BLADES**
Effect of particle characteristics on trajectories and blade impact patterns p 643 A86-40731
Clearance effects on heat transfer at the tips of plain and grooved turbine airfoils p 644 A86-40737
Influence of molybdenum, tungsten, and cobalt on the corrosion of high-temperature strength nickel alloys in molten salts p 663 A86-41988
Turbine airfoil LCF life prediction verification
[AIAA PAPER 86-1496] p 646 A86-42672
Thermal stability of gas turbine blades with protective coatings p 673 A86-43410
**TURBINE ENGINES**
The T800 turbine engine solicitation - A new thrust in streamlining the acquisition process
[AIAA PAPER 86-1689] p 684 A86-42782
Advanced turbine engine simulation technique development and applications to testing
[AIAA PAPER 86-1731] p 649 A86-42818
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085
Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947
**TURBINE WHEELS**
Probability of detection of flaws in a gas turbine engine component using electric current perturbation
p 669 A86-41574
**TURBOCOMPRESSORS**
Compressor erosion and performance deterioration
p 643 A86-40727
Prediction of fouled compressor performance using stage stacking techniques p 643 A86-40732
Study of single stage axial flow compressor performance deterioration p 643 A86-40735
Experimental and numerical study of the response of an axial compressor to distorted inlet flow
p 644 A86-40736
Performance deterioration during rotating stall in axial compressors p 644 A86-40738
Direct and system effects of water ingestion into jet engine compressors p 644 A86-40739
Wake induced unsteady aerodynamic interactions in a multi-stage compressor
[AIAA PAPER 86-1455] p 625 A86-42653
Axial-flow fan stalling behavior with circumferential inlet sectoring
[AIAA PAPER 86-1622] p 626 A86-42756
Multi-stage compressor airfoil aerodynamics. I - Airfoil potential flow analysis
[AIAA PAPER 86-1744] p 627 A86-42822
Reverse flow in multistage axial compressors
[AIAA PAPER 86-1747] p 627 A86-42825
Calculation of the balancing efficiency of flexible rotors of compressor units on low-cycle balancing machines
p 673 A86-43379
The development of a model for the unstable operation of a turbocompressor and the design of a device to protect a gas turbine engine against stalling and surging
p 650 A86-43390
A method for the analytical determination of accelerated test schedules for compressor blades working in a corrosive medium p 673 A86-43411
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463
Compressors study: Improving the efficiency of a high performance multistage compressor
[ESA-86-97192] p 651 N86-28948
**TURBOFAN AIRCRAFT**
Turbofan and propfan as basis for future economic propulsion concepts
[AIAA PAPER 86-1474] p 645 A86-42662
**TURBOFAN ENGINES**
Response of an operational turbofan engine to a simulated nuclear blast p 643 A86-40728
Factors relating to deterioration based on Rolls-Royce RB 211 in service performance p 643 A86-40730
After the big turbofans p 645 A86-42099
A computational fluid dynamics evaluation of test cell recirculation effects on high-bypass turbofan engine surface pressure distributions
[AIAA PAPER 86-1384] p 655 A86-42606
Theoretical and experimental investigation of test cell aerodynamics for turbofan applications
[AIAA PAPER 86-1732] p 656 A86-42819
Performance estimation of the mixed flow, afterburning, cooled, two-spool turbofan engine with bleed and power extraction
[AIAA PAPER 86-1757] p 649 A86-42830
A supersonic fan equipped variable cycle engine for a Mach 2.7 supersonic transport
[NASA-CR-177141] p 650 N86-28946
A study on the transmission of sound through flow ducts of varying cross section
[NLR-TR-83128-U] p 683 N86-29636
**TURBOFANS**
A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751
Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers
[NASA-TM-87333] p 683 N86-29630
**TURBOJET ENGINES**
Prediction of the stability performance of a turboreactor combustion chamber
[SNECMA-YKC-3269/85] p 651 N86-28949
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29028
**TURBOMACHINERY**
Turbomachinery performance deterioration; Proceedings of the Fourth Joint Fluid Mechanics, Plasma Dynamics, and Lasers Conference, Atlanta, GA, May 12-14, 1986 p 642 A86-40726
Particle trajectories in full 3D flow field of turbomachinery p 669 A86-40734
A comparison of computational methods for three-dimensional, turbulent turbomachinery flow fields
[AIAA PAPER 86-1599] p 626 A86-42740
Tip leakage reduction through tip injection in turbomachines
[AIAA PAPER 86-1746] p 627 A86-42824
Laser fringe anemometry for aero engine components
[NASA-TM-88798] p 629 N86-28053

NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463

**TURBOPROP AIRCRAFT**
Beech's enterprising Starship p 637 A86-40471

**TURBOPROP ENGINES**
S-duct inlet/diffusers for turboprop offset gearbox applications
[AIAA PAPER 86-1462] p 625 A86-42655
Turboprop and open rotor propulsion for the future
[AIAA PAPER 86-1472] p 645 A86-42660
Improved Euler analysis of advanced turboprop propeller flows
[AIAA PAPER 86-1521] p 625 A86-42688
Rotorcraft propulsion for year 2000 plus
[AIAA PAPER 86-1543] p 646 A86-42702
Small engine technology payoffs for future commuter aircraft
[AIAA PAPER 86-1544] p 646 A86-42703
Small turboshaft/turboprop engine technology study
[AIAA PAPER 86-1623] p 647 A86-42757
Correlation of theory and experiment for propfan inlets
[AIAA PAPER 86-1628] p 627 A86-42761
Experimental classical flutter reesults of a composite advanced turboprop model
[NASA-TM-88792] p 678 N86-29271

**TURBOSHAFTS**
Small turboshaft/turboprop engine technology study
[AIAA PAPER 86-1623] p 647 A86-42757

**TURBULENCE**
A perspective of computational fluid dynamics
[NASA-TM-88246] p 629 N86-28057
Cryogenic wind tunnels: Problems of continuous operation at low temperatures
[NASA-TM-88446] p 656 N86-28099
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173

**TURBULENT BOUNDARY LAYER**
Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261
Experimental investigation of the turbulent boundary layer at high Reynolds numbers and a Mach number of 0.8 p 624 A86-42168
An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064
Feasibility of generating an artificial burst in a turbulent boundary layer
[NASA-CR-4003] p 675 N86-28377

**TURBULENT FLOW**
Large and small structures in the computation of transition to fully developed turbulent flows
p 669 A86-41254
A simplified model of the turbulent microburst
[NASA-CR-177108] p 679 N86-29466

**TURBULENT WAKES**
Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693
Experimental analyses of trailing edge flows
[NASA-CR-176904] p 632 N86-28921

**TWO DIMENSIONAL FLOW**
Application of continuous vorticity panels to general unsteady incompressible two-dimensional lifting flows
p 624 A86-41690
Computation of two-dimensional transonic cascade flow using a new Navier-Stokes solver
[AIAA PAPER 86-1381] p 624 A86-42605

**TWO PHASE FLOW**
Dilute gas-particle flow in a centrifugal compressor impeller p 668 A86-40733

## U

**ULTRASONIC WAVE TRANSDUCERS**
Measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques
p 634 A86-41694

**UNSTEADY FLOW**
Unsteady transonic flow calculations for interfering lifting surface configurations p 623 A86-40118
Application of continuous vorticity panels to general unsteady incompressible two-dimensional lifting flows
p 624 A86-41690
Wake induced unsteady aerodynamic interactions in a multi-stage compressor
[AIAA PAPER 86-1455] p 625 A86-42653
Solution of problems of conjugate heat transfer during flow past bodies of different shape p 673 A86-43370
Mathematical model of the interaction of a single unsteady supersonic jet with a moving barrier of finite size p 628 A86-43401

**UPPER SURFACE BLOWN FLAPS**
Aerodynamic investigations toward an adaptive airfoil for a transonic transport aircraft p 623 A86-40115

**USER MANUALS (COMPUTER PROGRAMS)**
Computation of the transonic flow about a swept wing in the presence of an engine nacelle
[NASA-CR-177113] p 630 N86-28911

**USER REQUIREMENTS**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119

## V

**V/STOL AIRCRAFT**
Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[NASA-TM-88218] p 629 N86-28056

**VANES**
Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947

**VARIABLE GEOMETRY STRUCTURES**
Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947

**VARIABLE STREAM CONTROL ENGINES**
Flight effects on noise from coaxial dual flow. II - Heated jets p 644 A86-41708

**VARIABLE SWEEP WINGS**
Canard/tail comparison for an advanced variable-sweep-wing fighter p 637 A86-41688

**VARIATIONAL PRINCIPLES**
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361

**VERBAL COMMUNICATION**
Radio telephony - A case for growing concern
p 635 A86-40569
Language problems in air traffic control
p 635 A86-40570

**VERY LARGE SCALE INTEGRATION**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337
Mil-DAP: Its architecture and role as a real time airborne digital signal processor p 681 N86-28359
The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372

**VHSIC (CIRCUITS)**
Possible impacts of VHSIC on MIL-STD-1553B data transmission management p 674 N86-28371
The impact of very high performance integrated circuits on avionics system readiness p 674 N86-28373
The impact of artificial intelligence on airborne maritime reconnaissance p 675 N86-28374

**VIBRATION**
Experimental study using nearfield acoustic holography of sound transmission through fuselage sidewall structures
[NASA-CR-177162] p 683 N86-28702
Interaction of airborne and structureborne noise radiated by plates. Volume 1: Analytical study
[NASA-TM-87746] p 683 N86-29633

**VIBRATION DAMPING**
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[NASA-TM-86828] p 639 N86-28079
Flutter prediction for a wing with active aileron control
[NASA-CR-176994] p 655 N86-28959

**VIBRATION MEASUREMENT**
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105

**VIBRATION MODE**
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463

**VIBRATION TESTS**
Aeroelastic tests of OA 206 and OA 207 profiles
[ONERA-RT-22/1841-RY-310-R] p 641 N86-28942

**VIBRATIONAL STRESS**
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29028

**VISCOUS FLOW**
Viscous effects on transonic airfoil stability and response p 623 A86-40110
A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751

**VOLTAGE REGULATORS**
Digital simulation of regulated electrical power supplies for military applications p 669 A86-40775

**VORTEX ALLEVIATION**
Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693

**VORTEX BREAKDOWN**
Investigation of empennage buffeting
[NASA-CR-177164] p 654 N86-28951

**VORTEX GENERATORS**
The flowfield of a side-dump combustor
p 673 N86-28237
Feasibility of generating an artificial burst in a turbulent boundary layer
[NASA-CR-4003] p 675 N86-28377

**VORTEX RINGS**
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935

**VORTEX SHEDDING**
A novel feedback concept for combustion instability in ramjets p 665 N86-28236

**VORTEX SHEETS**
Analytical observations on the aerodynamics of a delta wing with leading edge flaps
[NASA-CR-177022] p 630 N86-28913
Wake shape and its effects on aerodynamic characteristics
[NASA-CR-178118] p 631 N86-28918
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935

**VORTICES**
Interactions between acoustics and vortex structures in a central dump combustor
[AIAA PAPER 86-1609] p 671 A86-42749
The flowfield of a side-dump combustor
p 673 N86-28237
Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242
Feasibility of generating an artificial burst in a turbulent boundary layer
[NASA-CR-4003] p 675 N86-28377
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
An analysis of blade vortex interaction aerodynamics and acoustics
[NASA-CR-177016] p 630 N86-28912
A study of the factors affecting boundary layer two-dimensionality in wind tunnels
[NASA-CR-177023] p 631 N86-28914
Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935
Flow past a flat plate with a vortex/sink combination
[NASA-CR-176908] p 676 N86-29159

**VORTICITY**
Application of continuous vorticity panels to general unsteady incompressible two-dimensional lifting flows
p 624 A86-41690

## W

**WAKES**
Wake induced unsteady aerodynamic interactions in a multi-stage compressor
[AIAA PAPER 86-1455] p 625 A86-42653

**WATER**
Direct and system effects of water ingestion into jet engine compresors p 644 A86-40739

**WATER INJECTION**
Transient engine performance with water ingestion
[AIAA PAPER 86-1621] p 647 A86-42755

**WATER TUNNEL TESTS**
Feasibility of generating an artificial burst in a turbulent boundary layer
[NASA-CR-4003] p 675 N86-28377

**WATER VAPOR**
The calculation of the entropy distribution along cloud traverses using aircraft measurements
p 678 A86-40555

**WATER WAVES**
Elimination of directional wave spectrum contamination from noise in elevation measurements
p 641 A86-40854

**WEAPON SYSTEMS**
An overview of USAF engine diagnostic systems
[AIAA PAPER 86-1679] p 649 A86-42790
Expert systems for aviation maintenance
[AIAA PAPER 86-1143] p 622 A86-43332
The impact of artificial intelligence on airborne maritime reconnaissance p 675 N86-28374
Aeritalia: Avionics, optoelectronics research, ATR 42
p 642 N86-29080

**WEAR**
X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430

Development of a portable wear metal analyzer for field use
[AD-A166013] p 622 N86-28906
**WEAR RESISTANCE**
Carbon-carbon composites for braking
p 661 A86-40364
**WEBS (SHEETS)**
Aircraft barricade
[AD-D012194] p 656 N86-28102
**WEDGE FLOW**
Experimental study of superscnic flow around a single-stage wedge with cheeks at sideslip angles
p 628 A86-43404
**WEIBULL DENSITY FUNCTIONS**
Weibull-distributed ground clutter in the frequency domain p 671 A86-41883
**WEIGHT REDUCTION**
Optimal design of antisymmetric laminated composite plates p 667 A86-40109
Production of aluminium-lithium alloy with high specific properties p 659 A86-40255
Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715
The design of composite structures --- aircraft design
[SNIAS-861-111-103] p 640 N86-28082
**WHIP ANTENNAS**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119
**WIND SHEAR**
Taming the killer wind shear p 678 A86-41035
A simplified model of the turbulent microburst
[NASA-CR-177108] p 679 N86-29466
**WIND TUNNEL APPARATUS**
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375
The effect of a splitter plate as boundary layer removal system in half-model testing --- wings
[DFVLR-FB-85-64] p 657 N86-28969
**WIND TUNNEL CALIBRATION**
Evaluation of a quartz bourdon pressure gage of wind tunnel Mach number control system application
[NASA-TM-88991] p 677 N86-29198
**WIND TUNNEL MODELS**
Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 682 A86-41689
A numerical study of the aerodynamic interference of a model support system used in the RAE 5 metre wind tunnel
[AD-A165671] p 657 N86-28962
Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model
[NASA-TM-88442] p 657 N86-28964
The effect of a splitter plate as boundary layer removal system in half-model testing --- wings
[DFVLR-FB-85-64] p 657 N86-28969
**WIND TUNNEL TESTS**
Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 682 A86-41689
Experimental investigation of the turbulent boundary layer at high Reynolds numbers and a Mach number of 0.8 p 624 A86-42168
S-duct inlet/diffusers for turboprop offset gearbox applications
[AIAA PAPER 86-1462] p 625 A86-42655
Theoretical and experimental analysis of highspeed propeller aerodynamics
[AIAA PAPER 86-1549] p 626 A86-42706
A report on the initial testing of the large scale advanced prop-fan
[AIAA PAPER 86-1551] p 647 A86-42708
Correlation of theory and experiment for propfan inlets
[AIAA PAPER 86-1628] p 627 A86-42761
Application of laser-dual-focus velocimetry in a counterflow p 628 A86-43110
An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064
Transonic and supersonic wind tunnel tests on schematic missile configurations with two different nose lengths
[FFA-TN-1984-62] p 630 N86-28066
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919
Experimental analyses of trailing edge flows
[NASA-CR-176904] p 632 N86-28921
Development of flight testing techniques
[NASA-CR-176996] p 640 N86-28936
Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model
[NASA-TM-88442] p 657 N86-28964
The effect of a splitter plate as boundary layer removal system in half-model testing --- wings
[DFVLR-FB-85-64] p 657 N86-28969
**WIND TUNNEL WALLS**
Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 682 A86-41689
Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers
[NASA-TM-87333] p 683 N86-29630
**WIND TUNNELS**
Flow direction measurement criteria and techniques planned for the 40- by 80-/80- x 120-foot wind tunnel integrated systems tests
[NASA-CR-176969] p 676 N86-29152
**WINDSHIELDS**
Characterisation and influence of orientation and internal stress in acrylic aircraft materials --- windows, canopies, PMMA
[NPL-DMA(A)113] p 665 N86-28193
New transparent solid material for helicopter windshields
[SNPE-NT-37/85/CRB/NP] p 641 N86-28941
**WING LOADING**
The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080
**WING NACELLE CONFIGURATIONS**
VSAERO analysis of a wing/pylon/nacelle configuration
[AIAA PAPER 86-1523] p 625 A86-42689
Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709
**WING PANELS**
Design of a carbon-fiber reinforced wing for the Alpha-Jet major panel tests p 638 A86-41692
**WING PROFILES**
Aerodynamic investigations toward an adaptive airfoil for a transonic transport aircraft p 623 A86-40115
Aeroelastic tests of OA 206 and OA 207 profiles
[ONERA-RT-22/1641-RY-310-R] p 641 N86-28942
**WING SPAN**
Rotational-translational subsonic motion of a finite-span wing in an ideal gas p 628 A86-43384
**WING TIPS**
Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922
A theory for lateral wing-tip blowing
[NASA-CR-176931] p 632 N86-28923
**WINGS**
A study of the factors affecting boundary layer two-dimensionality in wind tunnels
[NASA-CR-177023] p 631 N86-28914
Flutter prediction for a wing with active aileron control
[NASA-CR-176994] p 655 N86-28959
**WORKLOADS (PSYCHOPHYSIOLOGY)**
The integrated manual and automatic control of complex flight systems
[NASA-CR-177086] p 654 N86-28952

## X

**X RAY FLUORESCENCE**
X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430
**X RAY IMAGERY**
Robotic nondestructive inspection of aerospace structures p 668 A86-40509
**X WING ROTORS**
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917

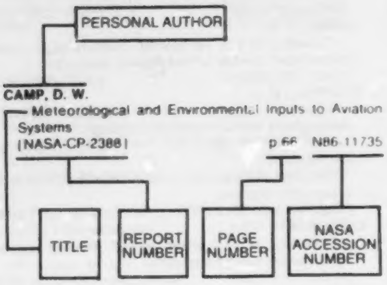
## Y

**YAW**
Multiaxis aircraft control power from thrust vectoring at high angles of attack
[NASA-TM-87741] p 629 N86-28054
**YIELD POINT**
Probabilistic damage tolerance analysis of aircraft structures
[FFA-TN-1985-68] p 640 N86-28081

# PERSONAL AUTHOR INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 206)* November 1986

### Typical Personal Author Index Listing



PERSONAL AUTHOR
CAMP, D. W.
Meteorological and Environmental Inputs to Aviation Systems
[NASA-CP-2388] p 66 N86-11735
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABDEL-WAHAB, M.**
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085

**ACURIO, J.**
The T800 turbine engine solicitation - A new thrust in streamlining the acquisition process
[AIAA PAPER 86-1669] p 684 A86-42782

**ADAMS, R. M.**
Response of an operational turbofan engine to a simulated nuclear blast p 643 A86-40728

**ADAMSON, M.**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344

**ADIBHATLA, S.**
A design approach to a performance seeking control
[AIAA PAPER 86-1674] p 652 A86-42785

**AFROSIMOVA, V. N.**
Small film-evaporation type combustion chamber for a low-power gas turbine engine p 650 A86-43395

**AGARWAL, N. K.**
Flight simulator upgrades and modifications
p 655 A86-40477

**AGARWAL, R. K.**
Euler solutions for airfoil/jet/ground-interaction flowfields p 623 A86-40112

**AGGARWAL, B. B.**
Knowledge-based systems for rotordynamic diagnostics
[AIAA PAPER 86-1678] p 648 A86-42789

**AHMAD, M.**
Coarsening of delta prime, T1, S prime phases and mechanical properties of two Al-Li-Cu-Mg alloys
p 660 A86-40303

**ALCORTA, J. A.**
Small engine propulsion readiness for the 21st century
[AIAA PAPER 86-1624] p 647 A86-42758

**ALJABRI, A. S.**
Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709

**ALLEN, J. M.**
Application of a supersonic Euler code (SWINT) to wing-body-tail geometries p 624 A86-41697

**ALLEN, R. J.**
Turbine airfoil LCF life prediction verification
[AIAA PAPER 86-1496] p 646 A86-42672

**ANDERSON, G. Y.**
Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code
[AIAA PAPER 86-1426] p 624 A86-42635

**ANDERSON, L. C.**
Application of system identification to aircraft flight test data processing p 638 A86-43002

**ANEX, R. P.**
Integrated control - A decentralized approach
p 681 A86-42996

**ANTROPIUS, K.**
Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105

**ARROWSMITH, D. J.**
Adhesive bonding of aluminium-lithium alloys
p 660 A86-40267

**ASH, R. L.**
An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction
[NASA-CR-177133] p 630 N86-28064

**ASLIN, P. P.**
The design of a sliding mode controller for dutch roll damping in a non-linear aircraft system
p 651 A86-40766

**ASTRIDGE, D. G.**
Health and usage monitoring techniques for greater safety in helicopter operations p 621 A86-40232

**ATHANS, M.**
Multivariable control of a twin lift helicopter system using the LOG/LTR design methodology
[NASA-CR-177025] p 654 N86-28956
Multivariable control systems with saturating actuators antireset windup strategies
[NASA-CR-177100] p 682 N86-29580

**ATLURI, S. N.**
Constitutive modeling of cyclic plasticity and creep, using an internal time concept p 670 A86-41673

**AVRAAMOV, Y. S.**
Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys
[PB86-184314] p 665 N86-28186

**AZZAZY, M.**
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375

## B

**BAKER, C.**
Aluminium-lithium alloys III; Proceedings of the Third International Aluminium-Lithium Conference, Oxford University, England, July 8-11, 1985 p 659 A86-40251

**BALABUYEV, P. V.**
General designer Balabuyev on An-124 Ruslan features p 623 N86-28910

**BALL, W. H.**
Effects of S-bends on diffuser internal performance and turbulence characteristics
[AIAA PAPER 86-1459] p 625 A86-42654

**BALOUGH, D. L.**
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917

**BAR-KANA, I.**
Robust simplified adaptive control for a class of multivariable continuous-time systems
p 680 A86-42860

**BAR-SHALOM, Y.**
Dual control and prevention of the turn-off phenomenon in a class of mimo systems p 681 A86-43000

**BARRAU, J.-J.**
A model for the equivalent bending characteristics of a composite beam p 667 A86-40361

**BARTON, J. M.**
Improved Euler analysis of advanced turboprop propeller flows
[AIAA PAPER 86-1521] p 625 A86-42688

**BATINA, J. T.**
Viscous effects on transonic airfoil stability and response p 623 A86-40110
Unsteady transonic flow calculations for interfering lifting surface configurations p 623 A86-40118

**BAUMEISTER, K. J.**
Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 682 A86-41689
Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers
[NASA-TM-87333] p 683 N86-29630

**BEACHER, B. F.**
Improved compressor performance using recessed clearance (trenches) over the rotor
[AIAA PAPER 86-1745] p 649 A86-42823

**BEANE, G. A., IV**
Military aircraft propulsion lubricants: Current and future trends p 666 N86-29249

**BECKER, A.**
Integrated navigation, communication, and surveillance systems based on standard distance measuring equipment p 635 A86-40116

**BEHAR, S.**
The flowfield of a side-dump combustor
p 673 N86-28237

**BEINER, L.**
Weight minimization of orthotropic flat panels subjected to a flutter speed constraint p 671 A86-41715

**BEISSNER, R. E.**
Probability of detection of flaws in a gas turbine engine component using electric current perturbation
p 669 A86-41574
Application of a computer model to electric current perturbation probe design p 669 A86-41576

**BELLOMY, D. C.**
Theoretical and experimental investigation of test cell aerodynamics for turbofan applications
[AIAA PAPER 86-1732] p 656 A86-42819

**BELZ, R. A.**
A turbine engine inlet viewing system
[AIAA PAPER 86-1647] p 656 A86-42769

**BERARDI, L.**
Possible impacts of VHSIC on MIL-STD-1553B data transmission management p 674 N86-28371

**BERG, D. F.**
A design approach to a performance seeking control
[AIAA PAPER 86-1674] p 652 A86-42785

**BERNARD, J.-P.**
The French air traffic control system today - A paradox p 635 A86-40230

**BERRY, H. M.**
Viscous effects on transonic airfoil stability and response p 623 A86-40110

**BIANCHINI, J. C.**
Computing codes for development of helicopter crashworthy structures and test substantiation
[SNIAS-861-210-106] p 640 N86-28084

**BIEHL, W.**
Effect of engine technology on advanced fighter design and cost p 644 A86-41691

**BIESIADNY, T. J.**
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085

**BILLET, G.**
Experimental and numerical study of the response of an axial compressor to distorted inlet flow
p 644 A86-40736

**BIPPES, H.**
The effect of a splitter plate as boundary layer removal system in half-model testing
[DFVLR-FB-85-64] p 657 N86-28969

**BLANCHARD, A.**
Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model
[NASA-TM-88442] p 657 N86-28964

**BLEAU, R. O.**
Developing a maintenance concept for future electronic systems
[AIAA PAPER 86-1145] p 684 A86-43333

READEX FICHE best copy available

**BLEVINS, E. G.**
Advanced turbine engine simulation technique development and applications to testing
[AIAA PAPER 86-1731] p 649 A86-42818

**BLOM, A. F.**
Probabilistic damage tolerance analysis of aircraft structures
[FFA-TN-1985-68] p 640 N86-28081

**BOBER, L. J.**
Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726
Improved Euler analysis of advanced turboprop propeller flows
[AIAA PAPER 86-1521] p 625 A86-42688

**BOBO, S.**
Development of an operating profile for aircraft tires
[FAA/CT-85-32] p 677 N86-29218

**BOERSTOEL, J. W.**
Design of transonic airfoils with given pressure, subject to geometric constraints
[NLR-TR-84064-U] p 633 N86-28928

**BOHLMANN, R. E.**
Bolted composite repairs subjected to biaxial or shear loads p 662 A86-41052

**BOOTHE, E. M.**
Simulator upgrade - Regulations and benefits
p 621 A86-40478

**BORIS, J.**
Interactions between acoustics and vortex structures in a central dump combustor
[AIAA PAPER 86-1609] p 671 A86-42749
Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242

**BORN, M.**
A large displacement formulation for anisotropic beam analysis p 671 A86-42075

**BOUSQUET, J. M.**
Theoretical and experimental analysis of highspeed propeller aerodynamics
[AIAA PAPER 86-1549] p 626 A86-42706

**BOWERS, A. H.**
A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919

**BOWLES, J. V.**
Helicopter rotor and engine sizing for preliminary performance estimation
[AIAA PAPER 86-1756] p 638 A86-42829

**BOWLES, S. J.**
An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41596

**BRADLAUGH-DREDGE, T.**
Propfan test assessment (PTA) quick engine change (QEC) nacelle
[AIAA PAPER 86-1626] p 648 A86-42759

**BRADSHAW, A.**
The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767

**BRADY, L. D.**
Investigations for improving operational reliability and maintainability of ILS components. Volume 2: Figures and illustrations
[FAA/PM-86/7.11-VOL-2] p 636 N86-28932

**BRAHNEY, J. H.**
Composite repair techniques examined
p 662 A86-41684

**BRAITHWAITE, W. M.**
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085

**BRASIER, C. W.**
A turbine engine inlet viewing system
[AIAA PAPER 86-1647] p 656 A86-42769

**BREIL, J. F.**
Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model
[NASA-TM-88442] p 657 N86-28964

**BRETZ, P. E.**
'Alithalite' alloys - Progress, products and properties
p 660 A86-40256

**BROOKE, D.**
Initial performance evaluation of 2DCD ejector exhaust systems
[AIAA PAPER 86-1615] p 626 A86-42753

**BROOM, I.**
STOLport London - A design for safety
p 655 A86-40226

**BROQUERE, B.**
Carbon-carbon composites for braking
p 661 A86-40364

**BROWN, E. N.**
Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29508

**BROWN, J. J.**
A nozzle design analysis technique
[AIAA PAPER 86-1613] p 647 A86-42751

**BROWN, P. E.**
The T800 turbine engine solicitation - A new thrust in streamlining the acquisition process
[AIAA PAPER 86-1669] p 684 A86-42782

**BRUNSCH, K.**
Autoclave, compression moulding p 668 A86-40495
Experiences in FRG in aerospace application
p 661 A86-40498

**BRUSSAT, T. R.**
Damage tolerance assessment of aircraft attachment lugs p 672 A86-43084

**BRYAN, T.**
An Orbital Maneuvering Vehicle simulator
p 658 A86-40515

**BUCHARLES, A.**
Eigenvalues assignment method: An application to designing an autopilot
[SNIAS-861-111-106] p 653 N86-28095

**BUCK, V.**
Tribology in aircraft systems: Basic principles and applications p 677 N86-29240

**BULL, M. J.**
Textures developed in Al-Li-Cu-Mg alloy
p 660 A86-40291

**BULYCHEV, V. A.**
Calculation of the balancing efficiency of flexible rotors of compressor units on low-cycle balancing machines
p 673 A86-43379

**BURGE, S. E.**
The design of multi-functional flight controllers for structural load alleviation p 651 A86-40767

**BURKARDT, L. A.**
Uniform engine testing program phase 7: NASA Lewis Research Center second entry
[NASA-TM-87272] p 650 N86-28085

**BURKHARDT, G. L.**
Probability of detection of flaws in a gas turbine engine component using electric current perturbation
p 669 A86-41574
Application of a computer model to electric current perturbation probe design p 669 A86-41576

**BURNER, A. W.**
Improvement in the quality of flow visualization in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87730] p 675 N86-28389

**BUTLER, T. L.**
Redistribution of an inlet temperature distortion in an axial flow turbine stage
[AIAA PAPER 86-1468] p 671 A86-42658

**BYRD, F.**
Using Derivative engine technology to achieve maturity goals
[AIAA PAPER 86-1752] p 649 A86-42826

## C

**CAGLAYAN, A. K.**
Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors
[NASA-TM-88998] p 637 N86-28933

**CALISE, A. J.**
An analysis of a four state model for pursuit-evasion games p 680 A86-42957

**CALVO, W. C.**
Solid fuel gas generator air
[AIAA PAPER 86-1682] p 649 A86-42792

**CAMPBELL, A. F.**
Effects of S-bends on diffuser internal performance and turbulence characteristics
[AIAA PAPER 86-1459] p 625 A86-42654

**CAMPBELL, D. R.**
Software position and velocity limiting for a synergistic six degree-of-freedom motion system
p 655 A86-42170

**CANAN, J. W.**
Mastering the transatmosphere p 658 A86-41274

**CANSLER, F.**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119

**CAPACE, V. R.**
Wake induced unsteady aerodynamic interactions in a multi-stage compressor
[AIAA PAPER 86-1455] p 625 A86-42653

**CAPONE, F. J.**
Multiaxis aircraft control power from thrust vectoring at high angles of attack
[NASA-TM-87741] p 629 N86-28054

**CARALYUS, J.**
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119

**CARDON, A.**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344

**CARPENTER, T.**
In-flight thrust determination on a real-time basis
[NASA-CR-176997] p 641 N86-28937

**CARPER, D. M.**
Response of composite material shallow arch to concentrated load p 670 A86-41609

**CHAPIN, W. G.**
Evaluation of a quartz bourdon pressure gage of wind tunnel Mach number control system application
[NASA-TM-88991] p 677 N86-29198

**CHAPPELL, M. A.**
Advanced turbine engine simulation technique development and applications to testing
[AIAA PAPER 86-1731] p 649 A86-42818

**CHAUVEAU, Y.**
Prediction of the stability performance of a turboreactor combustion chamber
[SNECMA-YKC-3269/85] p 651 N86-28949

**CHEGINI, H.**
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft
[NASA-TM-87706] p 675 N86-28385

**CHEVALIER, P.**
Experimental and numerical study of the response of an axial compressor to distorted inlet flow
p 644 A86-40736

**CHOUDHURY, P. R.**
A novel feedback concept for combustion instability in ramjets p 665 N86-28236

**CHRISTENSEN, K. L.**
Solid fuel gas generator air
[AIAA PAPER 86-1682] p 649 A86-42792

**CHRISTIE, T. J.**
Design for engine supportability
[AIAA PAPER 86-1671] p 648 A86-42784

**CHUNG, S. Y.**
Formal optimization of hovering performance using free wake lifting surface theory

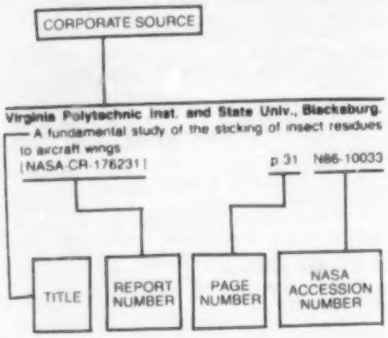
# CORPORATE SOURCE INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 206)*

November 1986

## Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems
[AGARD-CP-380] p 674 N86-28337
Shock-wave boundary layer interactions
[AGARD-AG-280] p 676 N86-29173
Aircraft and Bearing Tribological Systems
[AGARD-CP-394] p 677 N86-29236

**Aeritalia S.p.A., Caselle Torinese (Italy).**
Possible impacts of VHSIC on MIL-STD-1553B data transmission management p 674 N86-28371

**Aeronautical Research Inst. of Sweden, Stockholm.**
Transonic and supersonic wind tunnel tests on schematic missile configurations with two different nose lengths
[FFA-TN-1984-62] p 630 N86-28066
Probabilistic damage tolerance analysis of aircraft structures
[FFA-TN-1985-60] p 640 N86-28081

**Aeronautical Research Labs., Melbourne (Australia).**
Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985
[AD-A165846] p 640 N86-28080

**Aerostructures, Inc., Arlington, Va.**
NASTRAN supplemental documentation for modal forced vibration analysis of aerodynamically excited turbosystems
[NASA-CR-174967] p 675 N86-28463

**Air Force Aero Propulsion Lab., Wright-Patterson AFB, Ohio.**
Military aircraft propulsion lubricants: Current and future trends p 666 N86-29249

**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**
Crack growth in titanium alloys under the conjoint action of high and low cycle fatigue
[AD-A166429] p 665 N86-29026

**Air Force Systems Command, Wright-Patterson AFB, Ohio.**
Apparatus for the preparation of air
[AD-A165603] p 673 N86-28266

**Alabama Univ., Huntsville.**
An Orbital Maneuvering Vehicle simulator
p 658 A86-40515

**Alphatech, Inc., Burlington, Mass.**
Initial design and evaluation of automatic restructurable flight control system concepts
[NASA-CR-178064] p 652 N86-28090

**Analytical Mechanics Associates, Inc., Mountain View, Calif.**
Evaluation of the usefulness of various simulation technology options for TERPS enhancement
[NASA-CR-177408] p 636 N86-28931

**Army Aviation Systems Command, St. Louis, Mo.**
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[NASA-TM-86828] p 639 N86-28079
VHF-FM communications antennas for project SINCGARS (UH-1 tail whip antenna evaluation)
[AD-A165897] p 676 N86-29119

**Army Materials and Mechanics Research Center, Watertown, Mass.**
Direction of R and D and current status of understanding of advanced gear steels p 666 N86-29245

**Avco-Everett Research Lab., Mass.**
Laser metalworking technology transfer
[AD-A165808] p 664 N86-28168

**Avco Lycoming Div., Stratford, Conn.**
Small engine technology payoffs for future commuter aircraft
[AIAA PAPER 86-1544] p 646 A86-42703

## B

**Boeing Commercial Airplane Co., Seattle, Wash.**
Local flow management/profile descent algorithm. Fuel-efficient, time-controlled profiles for the NASA TSRV airplane
[NASA-CR-172593] p 636 N86-28074
Design requirements and development of an airborne descent path definition algorithm for time navigation
[NASA-CR-178037] p 641 N86-28939
An investigation of TNAV equipped aircraft in a simulated en route metering environment
[NASA-CR-178031] p 641 N86-28940

**Boeing Vertol Co., Philadelphia, Pa.**
A study of the potential benefits associated with the development of a dedicated helicopter transmission lubricant p 666 N86-29242

**British Aerospace Aircraft Group, Woodford (England).**
The impact of artificial intelligence on airborne maritime reconnaissance p 675 N86-28374

## C

**California Inst. of Tech., Pasadena.**
Nonlinear analysis of pressure oscillations in ramjet engines p 659 N86-28240

**California Polytechnic State Univ., San Luis Obispo.**
The use of a panel code on high lift configurations of a swept forward wing
[NASA-CR-176968] p 631 N86-28916
Identification of linearized equations of motion for the fixed wing configuration of the rotor systems research aircraft
[NASA-CR-176977] p 631 N86-28917
A comparison of computer-generated lift and drag polars for a Wortmann airfoil to flight and wind tunnel results
[NASA-CR-176963] p 631 N86-28919
Comparison of theoretical and flight-measured local flow aerodynamics for a low-aspect-ratio fin
[NASA-CR-176995] p 632 N86-28920
Development of flight testing techniques
[NASA-CR-176996] p 640 N86-28936
In-flight thrust determination on a real-time basis
[NASA-CR-176997] p 641 N86-28937
Flutter prediction for a wing with active aileron control
[NASA-CR-176994] p 655 N86-28959
Flow direction measurement criteria and techniques planned for the 40- by 80-/80- x 120-foot wind tunnel integrated systems tests
[NASA-CR-176969] p 676 N86-29152

**Clemson Univ., S.C.**
Collocation for an integral equation arising in duct acoustics p 682 A86-43038

**Connecticut Univ., Storrs.**
Dual control and prevention of the turn-off phenomenon in a class of mimo systems p 681 A86-43000

**Construcciones Aeronauticas S.A., Madrid (Spain).**
Chemical control for Airbus composites. HPLC standardization
[I-104/84] p 664 N86-28133

## D

**Department of the Navy, Washington, D. C.**
Aircraft barricade
[AD-D012194] p 656 N86-28102

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany).**
The effect of a splitter plate as boundary layer removal system in half-model testing
[DFVLR-FB-85-64] p 657 N86-28969

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen (West Germany).**
Processing and meteorological evaluation of research flights with DFVLR motor gliders using the software package RAMF
[DFVLR-FB-85-57] p 678 N86-28588

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Stuttgart (West Germany).**
Tribology in aircraft systems: Basic principles and applications p 677 N86-29240

**Deutsche Lufthansa Aktiengesellschaft, Cologne (West Germany).**
Control systems for the Airbus design and functional experience
[ESA-86-96936] p 653 N86-28094

## E

**EG and G Washington Analytical Services Center, Inc., Pocomoke City, Md.**
Elimination of directional wave spectrum contamination from noise in elevation measurements
p 641 A86-40854

**Essex Corp., Huntsville, Ala.**
An Orbital Maneuvering Vehicle simulator
p 658 A86-40515

## F

**Florida Atlantic Univ., Boca Raton.**
An experimental and analytical investigation of isolated rotor flap-lag stability in forward flight
[NASA-CR-177028] p 654 N86-28957

**Flow Research, Inc., Kent, Wash.**
Large eddy simulations of flow in a ramjet combustor
p 659 N86-28241
Feasibility of generating an artificial burst in a turbulent boundary layer
[NASA-CR-4003] p 675 N86-28377

## G

**Garrett Turbine Engine Co., Phoenix, Ariz.**
Advanced technology payoffs for future rotorcraft, commuter aircraft, cruise missile, and APU propulsion systems
[AIAA PAPER 86-1545] p 638 A86-42704

**General Dynamics Corp., Fort Worth, Tex.**
Viscous effects on transonic airfoil stability and response p 623 A86-40110

**General Motors Corp., Indianapolis, Ind.**
Rotorcraft propulsion for year 2000 plus
[AIAA PAPER 86-1543] p 646 A86-42702

**Georgia Inst. of Tech., Atlanta.**
Constitutive modeling of cyclic plasticity and creep, using an internal time concept p 670 A86-41673
Flame driving of longitudinal instabilities in dump type ramjet combustors p 658 N86-28239
Pilot interaction with automated airborne decision making systems
[NASA-CR-177002] p 679 N86-29508

## I

**IIT Research Inst., Annapolis, Md.**
A comparison of the effects of two traffic alert and collision avoidance systems (TCAS 3 and TCAS 2) on the performance of the Air Traffic Control Radar Beacon System
[DOT/FAA/PM-86/8] p 636 N86-28930
**Imperial Coll. of Science and Technology, London (England).**
Future trends in helicopter transmission lubricants p 666 N86-29250

## J

**Jet Propulsion Lab., California Inst. of Tech., Pasadena.**
System and technology considerations for space-based air traffic surveillance
[AIAA PAPER 86-1170] p 658 A86-40581
**Joint Publications Research Service, Arlington, Va.**
USSR report: Transportation
[JPRS-UTR-86-007] p 622 N86-28908
Aeroflot officials roundtable on section's technical progress p 623 N86-28909
General designer Balabuyev on An-124 Ruslan features p 623 N86-28910
Aeritalia: Avionics, optoelectronics research, ATR 42 p 642 N86-29080
Properties, applications, future of European gyro sensors p 676 N86-29082

## K

**Kansas Univ. Center for Research, Inc., Lawrence.**
Wake shape and its effects on aerodynamic characteristics
[NASA-CR-178118] p 631 N86-28918
Investigation of empennage buffeting
[NASA-CR-177164] p 654 N86-28951
**KHD Luftfahrttechnik G.m.b.H., Oberursel (West Germany).**
Multifunctional requirements for a gearbox secondary power system in a modern fighter aircraft and its components and interface requirements p 678 N86-29243

## L

**Lockheed-California Co., Burbank.**
Development of a reusable, flight-weight cryogenic foam insulation system
[AIAA PAPER 86-1189] p 658 A86-40612
Development of an operating profile for aircraft tires
[FAA/CT-85-32] p 677 N86-29218
**Lockheed-Georgia Co., Marietta.**
Evaluation of propeller/nacelle interactions in the PTA program
[AIAA PAPER 86-1552] p 626 A86-42709

## M

**Maryland Univ., College Park.**
Response of composite material shallow arch to concentrated load p 670 A86-41699
**Massachusetts Inst. of Tech., Cambridge.**
Measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques p 634 A86-41694
Formal optimization of hovering performance using free wake lifting surface theory
[NASA-CR-177103] p 640 N86-28935
A supersonic fan equipped variable cycle engine for a Mach 2.7 supersonic transport
[NASA-CR-177141] p 650 N86-28946
Multivariable control of a forward swept wing aircraft
[NASA-CR-177112] p 654 N86-28953
Individual-blade-control research in the MIT VTOL Technology Laboratory 1977-1985
[NASA-CR-177121] p 654 N86-28954
Multivariable control of a twin lift helicopter system using the LQG/LTR design methodology
[NASA-CR-177025] p 654 N86-28956
Multivariable control systems with saturating actuators antireset windup strategies
[NASA-CR-177100] p 682 N86-29580
**Material Concepts, Inc., Columbus, Ohio.**
Advanced rotary engine components utilizing fiber reinforced Mg castings
[AIAA PAPER 86-1559] p 663 A86-42712
**McDonnell-Douglas Corp., Long Beach, Calif.**
Evaluation of laminar flow control systems concepts for subsonic commercial transport aircraft
[NASA-CR-159251] p 639 N86-28077
**Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany).**
Requirements on lubricatin oil from the view of a helicopter manufacturer p 666 N86-29244
**Missouri Univ., Rolla.**
Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 682 A86-41689
**Motoren- und Turbinen-Union Muenchen G.m.b.H. (West Germany).**
Aero-engine gears: Manufacturing cracks and their effect on operation p 677 N86-29239
Aircraft engine oils and their behaviour at high temperatures p 667 N86-29251
**Murray State Univ., Ky.**
X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430

## N

**National Aeronautics and Space Administration, Washington, D.C.**
Cryogenic wind tunnels: Problems of continuous operation at low temperatures
[NASA-TM-88446] p 656 N86-28099
NASA supercomputer system to become available nationally
[NASA-NEWS-RELEASE-86-92] p 681 N86-28628
Aerodynamics of the Viggen 37 aircraft. Part 1: General characteristics at low speed
[NASA-TM-88403] p 632 N86-28925
Optical technology for flight control systems
[NASA-TM-88400] p 655 N86-28960
Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model
[NASA-TM-88442] p 657 N86-28964
**National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.**
The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344
Wake hazard alleviation associated with roll oscillations of wake-generating aircraft p 624 A86-41693
Displacement thresholds in central and peripheral vision during tracking p 679 A86-41782
Helicopter rotor and engine sizing for preliminary performance estimation
[AIAA PAPER 86-1756] p 638 A86-42829
A time-based concept for terminal-area traffic management
[NASA-TM-88243] p 622 N86-28049
Geometry definition and grid generation for a complete fighter aircraft
[NASA-TM-88242] p 622 N86-28050
Development and validation of the crew-station system-integration research facility
[NASA-TM-86841] p 622 N86-28051
Hover in-ground-effect testing of a full-scale, tilt-nacelle V/STOL model
[NASA-TM-88218] p 629 N86-28056
A perspective of computational fluid dynamics
[NASA-TM-88246] p 629 N86-28057
Rotor/wing aerodynamic interactions in hover
[NASA-TM-88255] p 629 N86-28060
Patched-grid calculations with the Euler and Navier-Stokes equations: Theory and applications
[NASA-TM-88228] p 630 N86-28062
Time-based air traffic management using expert systems
[NASA-TM-88234] p 634 N86-28068
NASTRAN/FLEXSTAB procedure for static aeroelastic analysis
[NASA-TM-84897] p 639 N86-28076
Effects of blade-to-blade dissimilarities on rotor-body lead-lag dynamics
[NASA-TM-86828] p 639 N86-28079
Light weight fire resistant graphite composites
[NASA-CLASS-ARC-11615-1SB] p 664 N86-28131
Nonlinear control of aircraft
[NASA-TM-89225] p 655 N86-28958
**National Aeronautics and Space Administration. Dryden (Hugh L.) Flight Research Center, Edwards, Calif.**
Application of parameter estimation to highly unstable aircraft
[NASA-TM-88266] p 639 N86-28078
Test and evaluation of the HIDEC engine uptrim algorithm
[NASA-TM-88262] p 650 N86-28088
Effect of time delay on flying qualities: An update
[NASA-TM-88264] p 653 N86-28092
**National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.**
Test and evaluation of the HIDEC engine uptrim algorithm
[AIAA PAPER 86-1676] p 648 A86-42787
**National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.**
Computer sizing of fighter aircraft
[AIAA PAPER 85-0212] p 637 A86-40106
Viscous effects on transonic airfoil stability and response p 623 A86-40110
Unsteady transonic flow calculations for interfering lifting surface configurations p 623 A86-40118
Development of a reusable, flight-weight cryogenic foam insulation system
[AIAA PAPER 86-1189] p 658 A86-40612
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695
A forward-swept-wing fighter configuration designed by a transonic computational method p 638 A86-41696
Application of a supersonic Euler code (SWINT) to wing-body-tail geometries p 624 A86-41697
Measured and predicted heating distributions for biconics at Mach 10 p 624 A86-41734
Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610
Study of hypersonic inlet flow fields with a three-dimensional Navier-Stokes code
[AIAA PAPER 86-1426] p 624 A86-42635
A detailed numerical model of a supersonic reacting mixing layer
[AIAA PAPER 86-1427] p 671 A86-42636
Dynamic pressure loads associated with twin supersonic plume resonance
[AIAA PAPER 86-1539] p 646 A86-42701
Flight research on natural laminar flow nacelles - A progress report
[AIAA PAPER 86-1629] p 627 A86-42762
Failure detection and accommodation in structural dynamics systems using analytic redundancy p 658 A86-42938
X-ray fluorescence analysis of wear metals in used lubricating oils p 673 A86-43430
Multiaxis aircraft control power from thrust vectoring at high angles of attack
[NASA-TM-87741] p 629 N86-28054
Loads calibrations of strain gage bridges on the DAST project Aeroelastic Research Wing (ARW-2)
[NASA-TM-87677] p 639 N86-28075
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 2: Complete set of flight data
[NASA-TM-87632-PT-2] p 653 N86-28093
Feasibility study of optical boundary layer transition detection method
[NASA-CR-178109] p 675 N86-28375
Feasibility of a nuclear gauge for fuel quantity measurement aboard aircraft
[NASA-TM-87706] p 675 N86-28385
Improvement in the quality of flow visualization in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87730] p 675 N86-28389
Wind-tunnel acoustic results of two rotor models with several tip designs
[NASA-TM-87698] p 682 N86-28701
Design considerations for flight test of a fault inferring nonlinear detection system algorithm for avionics sensors
[NASA-TM-88998] p 637 N86-28933
Implementation and flight tests for the Digital Integrated Automatic Landing System (DIALS). Part 1: Flight software equations, flight test description and selected flight test data
[NASA-TM-87632-PT-1] p 653 N86-28950
Interface of the transport systems research vehicle monochrome display system to the digital autonomous terminal access communication data bus
[NASA-TM-87728] p 656 N86-28961
Process for preparing essentially colorless polyimide film containing phenoxy-linked diamines
[NASA-CASE-LAR-13353-1] p 666 N86-29039
Evaluation of a quartz bourdon pressure gage of wind tunnel Mach number control system application
[NASA-TM-88991] p 677 N86-29198

Interaction of airborne and structureborne noise radiated by plates. Volume 2: Experimental study [NASA-TM-87747] p 683 N86-29632

Interaction of airborne and structureborne noise radiated by plates. Volume 1: Analytical study [NASA-TM-87746] p 683 N86-29633

**National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.**

The measurement of aircraft performance and stability and control after flight through natural icing conditions [AIAA PAPER 86-9758] p 651 A86-40681

Modeling wind tunnel effects on the radiation characteristics of acoustic sources p 662 A86-41689

Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726

An LU implicit scheme for high speed inlet analysis [AIAA PAPER 86-1520] p 625 A86-42687

Improved Euler analysis of advanced turboprop propeller flows [AIAA PAPER 86-1521] p 625 A86-42688

Advanced rotary engine components utilizing fiber reinforced Mg castings [AIAA PAPER 86-1559] p 663 A86-42712

A numerical analysis applied to high angle of attack three-dimensional inlets [AIAA PAPER 86-1527] p 627 A86-42760

Laser fringe anemometry for aero engine components [NASA-TM-88798] p 629 N86-28053

Uniform engine testing program phase 7: NASA Lewis Research Center second entry [NASA-TM-87272] p 650 N86-28085

Experimental classical flutter reesults of a composite advanced turboprop model [NASA-TM-88792] p 678 N86-29271

Modeling the effects of wind tunnel wall absorption on the acoustic radiation characteristics of propellers [NASA-TM-87333] p 683 N86-29630

**National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.**

An Orbital Maneuvering Vehicle simulator p 658 A86-40515

New vistas in the determination of hydrogen in aerospace engine metal alloys [AIAA PAPER 86-1479] p 663 A86-42665

**National Aeronautics and Space Administration. Wallops Flight Center, Wallops Island, Va.**

Elimination of directional wave spectrum contamination from noise in elevation measurements p 641 A86-40854

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695

**National Aerospace Lab., Amsterdam (Netherlands).**

The use of mathematical optimization techniques by the designer [NLR-MP-85005-U] p 682 N86-28673

Design of transonic airfoils with given pressure, subject to geometric constraints [NLR-TR-84064-U] p 633 N86-28928

An introductory course on aircraft loading [NLR-MP-84090-U] p 641 N86-28943

A study on the transmission of sound through flow ducts of varying cross section [NLR-TR-83128-U] p 683 N86-29636

**National Bureau of Standards, Gaithersburg, Md.**

Materials technology for electrical appliances: Magnetic and electrical properties of metals and alloys [PB86-184314] p 665 N86-28186

**National Oceanic and Atmospheric Administration, Boulder, Colo.**

Elimination of directional wave spectrum contamination from noise in elevation measurements p 641 A86-40854

**National Physical Lab., Teddington (England).**

Characterisation and influence of orientation and internal stress in acrylic aircraft materials [NPL-DMA(A)113] p 665 N86-28193

**National Severe Storms Lab., Norman, Okla.**

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes p 634 A86-41695

**National Transportation Safety Board, Washington, D. C.**

Aircraft accident report: China Airlines Boeing 747-SP, N4522V 300 nautical miles northwest of San Francisco, California, February 19, 1985 [PB86-910403] p 634 N86-28069

Aircraft accident reports: Brief format US Civil and Foreign Aviation, issue number 10 of 1984 accidents [PB86-916906] p 634 N86-28070

Annual review of aircraft accident data. US air carrier operations: Calendar year 1982 [PB86-212529] p 634 N86-28929

**Naval Research Lab., Washington, D. C.**

Acoustic-vortex interactions in an idealized ramjet combustor p 659 N86-28242

**New York Univ., New York.**

Computation of the transonic flow about a swept wing in the presence of an engine nacelle [NASA-CR-177113] p 630 N86-28911

## O

**Office National d'Etudes et de Recherches Aerospatiales, Paris (France).**

Activities report in aerospace research [ESA-86-97190] p 622 N86-28907

Extension of a transonic three-dimensional unsteady small perturbation computing method [ONERA-RTS-23/3064-RY-048-R] p 633 N86-28927

Aeroelastic tests of OA 206 and OA 207 profiles [ONERA-RT-22/1841-RY-310-R] p 641 N86-28942

Boundary layer model to compute the edge effects in stratified composite plates [ONERA-RT-7/3542-RY-041-R] p 678 N86-29279

**Ohio State Univ., Columbus.**

Experimental analyses of trailing edge flows [NASA-CR-176904] p 632 N86-28921

**Ohio Univ., Athens.**

Siting criteria for Microwave Landing Systems (MLS) [FAA/PM-86/18] p 636 N86-28073

Investigations for improving operational reliability and maintainability of ILS components. Volume 2: Figures and illustrations [FAA/PM-86/7.11-VOL-2] p 636 N86-28932

**Old Dominion Coll., Norfolk, Va.**

An investigation of the feasibility of active boundary layer thickening for aircraft drag reduction [NASA-CR-177133] p 630 N86-28064

**Old Dominion Univ., Norfolk, Va.**

The influence of source location on the structural-acoustic interaction of cylinders p 638 A86-41710

**Oregon State Univ., Corvallis.**

First order analysis of the effect of pitching on the drag coefficient [DE86-006324] p 633 N86-28926

## P

**Pennsylvania State Univ., University Park.**

A comparison of computational methods for three-dimensional, turbulent turbomachinery flow fields [AIAA PAPER 86-1599] p 626 A86-42740

Experimental study using nearfield acoustic holography of sound transmission through fuselage sidewall structures [NASA-CR-177162] p 683 N86-28702

**Perkin-Elmer Corp., Pomona, Calif.**

Development of a portable wear metal analyzer for field use [AD-A166013] p 622 N86-28906

**Pratt and Whitney Aircraft, Middletown, Conn.**

Response of composite material shallow arch to concentrated load p 670 A86-41699

**Pratt and Whitney Aircraft, West Palm Beach, Fla.**

Further development of the dynamic gas temperature measurement system [AIAA PAPER 86-1648] p 672 A86-42770

**PRC Kentron, Inc., Hampton, Va.**

Dynamic pressure loads associated with twin supersonic plume resonance [AIAA PAPER 86-1539] p 646 A86-42701

Flight research on natural laminar flow nacelles - A progress report [AIAA PAPER 86-1629] p 627 A86-42762

**Princeton Univ., N. J.**

An LU implicit scheme for high speed inlet analysis [AIAA PAPER 86-1520] p 625 A86-42687

**Purdue Univ., West Lafayette, Ind.**

Viscous effects on transonic airfoil stability and response p 623 A86-40110

Direct and system effects of water ingestion into jet engine compresors p 644 A86-40739

Transient engine performance with water ingestion [AIAA PAPER 86-1621] p 647 A86-42755

The integrated manual and automatic control of complex flight systems [NASA-CR-177086] p 654 N86-28952

Multi-input, multi-output system control for experimental aircraft [NASA-CR-177017] p 654 N86-28955

Optimal cooperative control synthesis of active displays [NASA-177102] p 683 N86-29651

## R

**Research Triangle Inst., Research Triangle Park, N.C.**

An experiment in software reliability [NASA-CR-172553] p 682 N86-29547

**Resource International, Inc., Columbus, Ohio.**

Mechanistic methodology for airport pavement design with engineering fabrics. Volume 2: Advanced concepts, validation and criteria [DOT/FAA/PM-84/9,II-VOL-2] p 657 N86-28963

**Rijksluchtvaartdienst, The Hague (Netherlands).**

Future Aeronautical Communication System (FACS): Report [ESA-86-96959] p 673 N86-28309

**RJO Enterprises, Inc., Lanham, Md.**

Aircraft avionics suitable for advanced approach applications. Volume 1: Aircraft fleet equipage [DOT/FAA/PM-86/25,1] p 642 N86-28944

**Royal Aircraft Establishment, Farnborough (England).**

The impact of VHPIC on avionic system architecture, packaging and maintainability p 674 N86-28372

A numerical study of the aerodynamic interference of a model support system used in the RAE 5 metre wind tunnel [AD-A165671] p 657 N86-28962

**Royal Signals and Radar Establishment, Malvern (England).**

Mil-DAP: Its architecture and role as a real time airborne digital signal processor p 681 N86-28359

**Rutgers Univ., New Brunswick, N. J.**

Modelling of three-dimensional shock wave turbulent boundary layer interactions p 669 A86-41261

## S

**San Diego State Univ., Calif.**

The flowfield of a side-dump combustor p 673 N86-28237

**Schaefer (Georg) and Co., Schweinfurt (West Germany).**

Effects of unfavorable environmental conditions on the service life of jet engine and helicopter bearings p 677 N86-29238

De [illegible]culation of high speed engine bearings p 677 N86-29241

**Science Applications International Corp., Princeton, N.J.**

Computational models for the analysis/design of hypersonic scramjet components. I - Combustor and nozzle models [AIAA PAPER 86-1595] p 647 A86-42737

**Societe Nationale d'Etude et de Construction de Moteurs d'Aviation, Paris (France).**

Prediction of the stability performance of a turboreactor combustion chamber [SNECMA-YKC-3269/85] p 651 N86-28949

**Societe Nationale des Poudres et Explosifs, Vert-Le-Petit (France).**

New transparent solid material for helicopter windshields [SNPE-NT-37/85/CRB/NP] p 641 N86-28941

**Societe Nationale Industrielle Aerospatiale, Marignane (France).**

Computing codes for development of helicopter crashworthy structures and test substantiation [SNIAS-861-210-106] p 640 N86-28084

**Societe Nationale Industrielle Aerospatiale, Paris (France).**

The future of surface treatments in aeronautical construction [SNIAS-861-551-101] p 665 N86-29037

**Societe Nationale Industrielle Aerospatiale, Toulouse (France).**

The design of composite structures [SNIAS-861-111-103] p 640 N86-28082

The SIGMA cadcam software [SNIAS-861-111-110] p 640 N86-28083

Eigenvalues assignment method: An application to designing an autopilot [SNIAS-861-111-106] p 653 N86-28095

Main flight controls [SNIAS-861-111-111] p 653 N86-28096

Stress intensity factor in an integral or bonded stiffened panel using an analytical method [SNIAS-861-111-104] p 676 N86-28481

**Stanford Univ., Calif.**

An analysis of blade vortex interaction aerodynamics and acoustics [NASA-CR-177016] p 630 N86-28912

Analytical observations on the aerodynamics of a delta wing with leading edge flaps [NASA-CR-177022] p 630 N86-28913

A study of the factors affecting boundary layer two-dimensionality in wind tunnels [NASA-CR-177023] p 631 N86-28914

The lift of sharp-leading-edged delta wings with blowing
[NASA-CR-176967] p 631 N86-28915

Measurements on wing-tip blowing
[NASA-CR-176930] p 632 N86-28922

A theory for lateral wing-tip blowing
[NASA-CR-176931] p 632 N86-28923

Flow past a flat plate with a vortex/sink combination
[NASA-CR-176908] p 676 N86-29159

A simplified model of the turbulent microburst
[NASA-CR-177108] p 679 N86-29406

**Sverdrup Technology, Inc., Cleveland, Ohio.**

An LU implicit scheme for high speed inlet analysis
[AIAA PAPER 86-1520] p 625 A86-42667

**Syracuse Univ., N. Y.**

Linear and nonlinear dynamic analysis of redundant load path bearingless rotor systems
[NASA-CR-177098] p 682 N86-29579

## T

**Technische Univ., Munich (West Germany).**

Scoring tests of aircraft transmission lubricants at high speeds and high temperatures p 667 N86-29253

**Teledyne CAE, Toledo, Ohio.**

Variable area radial turbine fabrication and test program
[NASA-CR-175091] p 651 N86-28947

**Texas A&M Univ., College Station.**

Numerical evaluation of propeller noise including nonlinear effects p 645 A86-41726

**Thomson-CSF, Montrouge (France).**

The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369

**TRW Electronics and Defense Sector, Redondo Beach, Calif.**

The future of bipolar technology for avionics
p 674 N86-28341

**Turbomeca S. A. - Brevets Szydlowski, Bordes (France).**

Compressors study: Improving the efficiency of a high performance multistage compressor
[ESA-86-97192] p 651 N86-28948

## U

**University of Southern California, Los Angeles.**

A novel feedback concept for combustion instability in ramjets p 665 N86-28236

**University of Southern Colorado, Pueblo.**

Investigation of an advanced fault tolerant integrated avionics system
[NASA-CR-176980] p 642 N86-28945

## V

**Vigyan Research Associates, Inc., Hampton, Va.**

Effect of silane concentration on the supersonic combustion of a silane/methane mixture
[AIAA PAPER 86-1396] p 663 A86-42610

Flight research on natural laminar flow nacelles - A progress report
[AIAA PAPER 86-1629] p 627 A86-42762

**Virginia Polytechnic Inst. and State Univ., Blacksburg.**

Response of composite material shallow arch to concentrated load p 670 A86-41699

The influence of source location on the structural-acoustic interaction of cylinders
p 638 A86-41710

**Vrije Universiteit, Brussels (Belgium).**

The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344

## W

**Waterloo Univ. (Ontario).**

Critical evaluation of the unsteady aerodynamics approach to dynamic stability at high angles of attack
[NASA-CR-177104] p 632 N86-28924

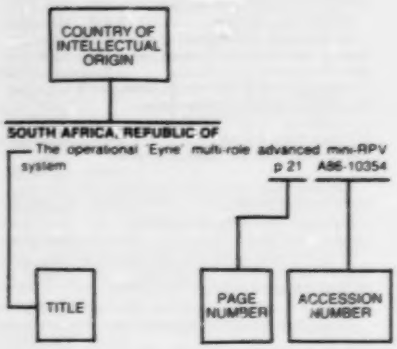
**Westinghouse Electric Corp., Baltimore, Md.**

The impact of very high performance integrated circuits on avionics system readiness p 674 N86-28373

# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 206)* November 1986

### Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

An analysis of acoustic emission detected during fatigue testing of an aircraft p 670 A86-41596

Mirage A3-002 strain responses to ground calibration loadings between 1978 and 1985 [AD-A165846] p 640 N86-28080

## B

**BELGIUM**

The combined effects of stress and moisture on the structural integrity of composites p 667 A86-40344

**BRAZIL**

Application of laser-dual-focus velocimetry in a counterflow p 628 A86-43110

## C

**CANADA**

Textures developed in Al-Li-Cu-Mg alloy p 660 A86-40291

Prediction of fouled compressor performance using stage stacking techniques p 643 A86-40732

A fiber optic damage monitor p 670 A86-41605

**CHINA, PEOPLE'S REPUBLIC OF**

A simplified residual stress model for predicting fatigue crack growth behavior at coldworked fastener holes p 662 A86-40575

Dilute gas-particle flow in a centrifugal compressor impeller p 668 A86-40733

Particle trajectories in full 3D flow field of turbomachinery p 669 A86-40734

**CZECHOSLOVAKIA**

Holographic mode shape investigation of aircraft engine impellers p 672 A86-43105

Experience with laboratory LDA by measuring flow fields in rotating turbomachinery p 672 A86-43109

## F

**FRANCE**

Computerisation of air information services in France p 635 A86-40229

The French air traffic control system today - A paradox p 635 A86-40230

Production of aluminium-lithium alloy with high specific properties p 659 A86-40255

A model for the equivalent bending characteristics of a composite beam p 667 A86-40361

Carbon-carbon composites for braking p 661 A86-40364

Sampling of solid particles in clouds p 668 A86-40720

Experimental and numerical study of the response of an axial compressor to distorted inlet flow p 644 A86-40736

Large and small structures in the computation of transition to fully developed turbulent flows p 669 A86-41254

Numerical study of the trailing edge region in slip flow regime p 624 A86-42548

Theoretical and experimental analysis of highspeed propeller aerodynamics [AIAA PAPER 85-1549] p 626 A86-42706

The design of composite structures [SNIAS-861-111-103] p 640 N86-28082

The SIGMA cadcam software [SNIAS-861-111-110] p 640 N86-28083

Computing codes for development of helicopter crashworthy structures and test substantiation [SNIAS-861-210-106] p 640 N86-28084

Eigenvalues assignment method: An application to designing an autopilot [SNIAS-861-111-106] p 653 N86-28095

Main flight controls [SNIAS-861-111-111] p 653 N86-28096

Cryogenic wind tunnels: Problems of continuous operation at low temperatures [NASA-TM-88446] p 656 N86-28099

The Impact of Very High Performance Integrated Circuits on Radar, Guidance and Avionics Systems [AGARD-CP-380] p 674 N86-28337

The application of high-performance integrated circuits for airport fire control radars p 674 N86-28369

Stress intensity factor in an integral or bonded stiffened panel using an analytical method [SNIAS-861-111-104] p 676 N86-28481

Activities report in aerospace research [ESA-86-97190] p 622 N86-28907

Extension of a transonic three-dimensional unsteady small perturbation computing method [ONERA-RTS-23/3064-RY-048-R] p 633 N86-28927

New transparent solid material for helicopter windshields [SNPE-NT-37/85/CRB/NP] p 641 N86-28941

Aeroelastic tests of OA 206 and OA 207 profiles [ONERA-RT-22/1841-RY-310-R] p 641 N86-28942

Compressors study: Improving the efficiency of a high performance multistage compressor [ESA-86-97192] p 651 N86-28948

Prediction of the stability performance of a turboreactor combustion chamber [SNECMA-YKC-3269/85] p 651 N86-28949

Tests with three-dimensional adjustments in the rectangular working section of the French T2 wind tunnel with an AS 07-type swept-back wing model [NASA-TM-88442] p 657 N86-28964

The future of surface treatments in aeronautical construction [SNIAS-861-551-101] p 665 N86-29037

Shock-wave boundary layer interactions [AGARD-AG-280] p 676 N86-29173

Aircraft and Bearing Tribological Systems [AGARD-CP-394] p 677 N86-29236

Boundary layer model to compute the edge effects in stratified composite plates [ONERA-RT-7/3542-RY-041-R] p 678 N86-29279

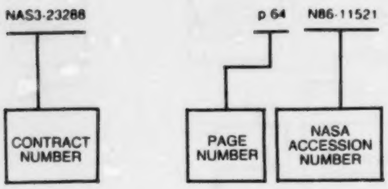
# CONTRACT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 206)* November 1986

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

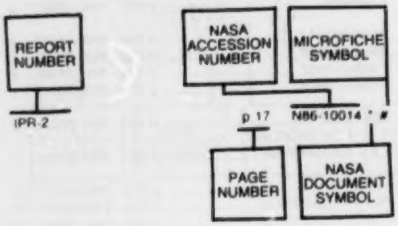
## Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

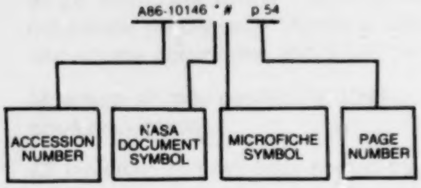
# ACCESSION NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 206)* November 1986

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Offfice at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts.* Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA – Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

## FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign–includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 484 reports, journal articles and other documents originally announced in November 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cummulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01** **Aeronautics (General)** 685

**Category 02** **Aerodynamics** 687
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03** **Air Transportation and Safety** 698
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04** **Aircraft Communications and Navigation** 702
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05** **Aircraft Design, Testing and Performance** 705
Includes aircraft simulation technology.

**Category 06** **Aircraft Instrumentation** 717
Includes cockpit and cabin display devices; and flight instruments.

**Category 07** **Aircraft Propulsion and Power** 720
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08** **Aircraft Stability and Control** 723
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09** **Research and Support Facilities (Air)** 730
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10** **Astronautics** 732
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communicatons, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11** **Chemistry and Materials** 732
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 735

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 746

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** N.A.

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 746

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 749

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 758

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** 758

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** N.A.

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

CONFERENCE DATE

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

## 01

## AERONAUTICS (GENERAL)

**A86-43890#**

**LINE REPLACEABLE MODULES - THE NEXT GENERATION OF AVIONICS**

D. H. WEISS (USAF, Washington, DC) IN: AUTOTESTCON '85; Proceedings of the International Automatic Testing Conference, Uniondale, NY, October 22-24, 1985 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 187-190.

New trends in avionics, their impact on test equipment, and third generation avionics capabilities are considered. An improved modular automatic test equipment concept is discussed, and an evolution towards third generation Line Replacement Modules instead of Line Replaceable Units and Shop Replaceable Units is indicated. Improved reliability and maintainability is the goal for Air Force second generation avionics, with a more-than 1300 hour mean time between failures required for new systems. It is suggested that new technologies would permit evolution of the USAF test philosophy from an avionics fly-to-failure policy to an avionics integrity program of preemptive removals. Other issues considered are changes due to material and human resource related issues. R.R.

**A86-43906**

**BUILT IN TEST (BIT) UTILIZATION FOR IMPROVED SUPPORTABILITY OF THE F-20 AIRCRAFT**

R. K. WALKER (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: AUTOTESTCON '85; Proceedings of the International Automatic Testing Conference, Uniondale, NY, October 22-24, 1985 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 446-449.

The use of avionics built-in test (BIT) as a fundamental part of off-aircraft support is demonstrated using F-20 avionics systems. The F-20 avionics systems briefly described here include the head-up display, the digital display indicator, the display processor, the data entry panel, the armament control panel, the mission computer, the multimode radar, the inertial navigation set, the pylon interface unit, the AIM-9 missile interface unit, and the communications, navigation identification interface unit. The equipment manufacturers are named and the projected mean time between failures is given. The application of BIT to these systems is described, and the improved reliability of this new generation of avionics is compared with that of the complex and expensive Avionics Intermediate Shops of the present. C.D.

**A86-44006#**

**DOUBLING THE AIR FORCE THROUGH GREATER RELIABILITY**

R. T. RODENROTH (USAF, Advanced Tactical Fighter Office, Wright-Patterson AFB, OH) Aerospace America (ISSN 0740-722X), vol. 24, June 1986, p. 44-46.

The U.S. Air Force, in studies conducted in anticipation of Advanced Tactical Fighter (ATF) design and performance requirements, has determined that greater attention to reliability and maintenance considerations should result not merely in cost reductions but in force-multiplying effects. At any given time, 90-92 percent of the ATF force will be available for use; half the aircraft grounded for maintenance should be ready to fly again in two hours, 75 percent in four hours, and fully 85 percent in eight hours. The ATF should also require only 8.7 maintainers per aircraft, which is less than half as many as those servicing current fighter aircraft. O.C.

**A86-44284**

**METHODS OF THE ASSEMBLY OF AIRCRAFT INSTRUMENTATION AND SYSTEMS [TEKHNOLOGIIA MONTAZHA PRIBORNOGO OBORUDOVANIIA LETATEL'NYKH APPARATOV]**

V. A. NEGREBA and L. V. MARKIN Moscow, Izdatel'stvo Mashinostroenie, 1985, 312 p. In Russian. refs

The book is concerned with methods, tools, and special techniques used in the assembly of on-board instrumentation and various aircraft systems. In particular, attention is given to general metal working and assembly techniques, assembly of electrical equipment and wiring, electric measurements and electric testing equipment, and assembly of navigation and control systems. The discussion also covers the assembly of high-altitude and oxygen systems, television and photographic equipment, and safety engineering. V.L.

**A86-44291**

**FUNDAMENTALS OF AVIATION TECHNOLOGY AND AIRPORT EQUIPMENT [OSNOVY AVIATSIONNOI TEKHNIKI I OBORUDOVANIE AEROPORTOV]**

V. I. BLOKHIN, ED. Moscow, Izdatel'stvo Transport, 1985, 256 p. In Russian. No individual items are abstracted in this volume.

The fundamental of aerodynamics, flight dynamics, and general aircraft design are presented, as are the basic principles of aircraft service and maintenance and characteristics of the main types of airfield equipment. In particular, attention is given to ground power supply sources, compressed air supply, towing and cleaning machines, and equipment for the storage and handling of fuels and lubricants. The discussion also covers navigation and ranging equipment, light signals, and the electric power supply system of airfields. V.L.

**A86-44422#**

**GENERIC INTEGRATED MAINTENANCE DIAGNOSTICS**

H. M. SEAMAN (USAF, Directorate of Support Systems Engineering, Wright-Patterson AFB, OH) IEEE Aerospace and Electronic Systems Magazine (ISSN 0885-8985), vol. 1, June 1986, p. 9-12.

An Air Force program designated GIMADS (Generic Integrated Maintenance Diagnostics) has been initiated to pursue a systems approach to weapon system maintenance using both prognostics and diagnostics. The program is an outgrowth of a study by the Air Force Operational Test and Evaluation Command of field maintenance effectiveness for the E-3A, EF-111 and F-16 aircraft. The 1984 directive initiating GIMADS stressed the requirement for 100 percent fault detection and isolation of weapon system faults by an optimized combination of testing techniques. Over a five-year period, the program will utilize a combination of ASD in-house engineering and contracted engineering support to gather data, perform studies and analyses, prepare technical and management

documentation, and develop hardware and software tools needed to implement an integrated diagnostics approach to maintenance for both electronic and nonelectronic systems. Technical integration will be accomplished by ASD engineering, and will consider and utilize on-going integrated diagnostics efforts in industry and government.

**A86-44442**
**LAUNCHING THE AEROSPACE PLANE**
T. A. HEPPENHEIMER High Technology (ISSN 0277-2981), vol. 6, July 1986, p. 46-51.

A discussion is presented concerning the performance requirements, the possible configurational, structural, and propulsion system features, and the R&D program management aspects, of the proposed 'aerospace plane'. Attention is given to the tradeoffs that must be considered in the use of airbreathing rather than rocket engines, as well as to the advanced refractory materials and fabrication techniques called for by high friction temperature, hypersonic flight, and the comparative advantages of various proposed fuels and engine multiple cycle schemes. NASA, DARPA, and British Aerospace are noted to be the most prominent research institutions in the development of aerospace plane designs.
O.C.

**A86-44919**
**WORLD AEROSPACE PROFILE 1986**
London, Sterling Publications, Ltd., 1986, 352 p. No individual items are abstracted in this volume.

A comprehensive evaluation is made of state-of-the-art achievement and development trends for numerous fields in aerospace technology throughout the industrial world, with attention to airframe, engine and avionics manufacturers in the U.S., U.K., France, West Germany, and Japan. Both civilian and military programs are discussed in articles covering composite airframes for materials, anticorrosion design practices, tilt-rotor aircraft design, next-generation SSTs, supersonic STOL and V/STOL development trends, Unducted Fan engine design evolution, propeller design trends, and novel aviation fueling methods. Also discussed are avionics for all glass cockpits, HUDs, future ATC developments, RPVs, flight simulators, advanced components, safety systems, commercial aircraft interior design, airport and airline planning, and financial management.
O.C.

**A86-44935**
**THE SELECTION AND ACQUISITION OF COMMERCIAL AIRCRAFT FLEETS**
W. PETERS (South African Airways, Johannesburg, Republic of South Africa) Aeronautica Meridiana (ISSN 0257-8573), vol. 6, no. 1, 1985, p. 43-50.

Fleet planning, aircraft selection and aircraft acquisition processes must be constantly undertaken by airlines irrespective of their size, and will have as their primary concern the matching of aircraft performance characteristics with market route networks, on the one hand, and on the other the large amounts and high cost of capital for fleet refurbishment. Other considerations encompass market analyses, the purchase of new or used aircraft, aircraft performance suitability for certain route sectors, and the guarantee of engine and airframe manufacturers' performance specifications.
O.C.

**A86-45063**
**NEW TECHNOLOGIES OFFER QUANTUM LEAP IN FUTURE FIGHTER CAPABILITIES**
R. R. ROPELEWSKI Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 23, 1986, p. 48, 49, 51, 52.

A new generation of airframe, engine, materials, and avionics technologies which will provide substantial performance, reliability, and survivability gains in future fighter aircraft is discussed. The expected advances in structures and materials, propulsion, avionics, and stealth are examined, including the contributions of the USAF advanced tactical fighter (ATF) the USN advanced tactical aircraft (ATA), and the multinational European fighter aircraft (EFA) programs. The characteristics of the super cockpits now under development, the first of which will enter full-scale development around 1990, are briefly addressed.
C.D.

**A86-45065**
**NASA'S LANGLEY CENTER MAKING GAINS IN ADVANCED TECHNOLOGY PROJECTS**
D. M. NORTH Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 23, 1986, p. 85, 87, 89.

Research projects at NASA's Langley Research Center aimed at achieving increased maneuverability in high angle of attack flight using multiaxis thrust vectoring in future fighter aircraft are discussed. Development programs to establish generic technology for aircraft beyond the USAF advanced tactical fighter and the USN advanced tactical aircraft are considered. The F/A-18 prototype acquired from the Navy will be used as a test bed. Wind tunnel testing of pylon, tangent, and semisubmerged pallet weapon mounting concepts on a generic aircraft wing is described, as is a leading edge flap vortex research program for fighter and attack aircraft. Future flight control systems for new technology aircraft which will accommodate the expanded flight envelopes permitted by thrust vectoring are discussed.
C.D.

**A86-45704#**
**LHX TARGETS DOLLARS AS WELL AS BOGEYS**
G. K. ANDRESON (U.S. Army, Aviation Systems Command, Saint Louis, MO) Aerospace America (ISSN 0740-722X), vol. 24, July 1986, p. 24-27.

The Army is reported to be working on the initial stages to develop a Light Helicopter family (LHX) to supplant its aging fleet of light rotorcraft. Affordability will be a key concern. Mission gross weight for the single-pilot scout and attack version called SCAT must be only 7500-8500 lb. Its flyaway cost must not exceed $6 million in 1984 dollars, and that of the utility version must be held to $4 million. Instead of the usual array of instruments and switches requiring pilot attention and physical actions, the SCAT cockpit will be simplified, integrated, and largely automated. SCAT will include a Mission Equipment Package (a sort of central nervous system) with sensors, processors, displays, controls and flight management interconnections. The helmet-mounted display approach is being considered. Considerable work will be required to develop workable software and assure that sufficient mission reliability is achieved. Prospective contractors include Boeing-Vertol/Sikorski, Bell, and Hughes; Hughes has been acquired by McDonnell Douglas, which has teamed with Bell. All have developed technology test beds. The request-for-proposals point is expected to be reached in March 1987.
D.H.

**A86-46199#**
**CFRP-WING FOR THE ALPHA JET**
D. ROSER Dornier Post (English Edition) (ISSN 0012-5563), no. 2, 1986, p. 21-24.

Carbon-fiber reinforced plastic (CFRP) wings were developed for the Alpha jet to control production costs while providing structural strength as high as that available from metals. The wings were required to satisfy the mission, operational range and flight envelope of the aircraft. The CFRP mixture selected was chosen on the basis of the environmental and external forces it would encounter, weight and optimal design constraints, the ability to handle complex loads, and the readiness of suitable quality control technologies. The wings have aluminum ribs and attachment fittings which were already qualified for the aircraft. Sample coupons of the CFRP material met the mechanical properties test criteria and a multi-rib configuration was selected as an additional weight saving measure. The manufacturing techniques for producing the complex composite components are outlined.

**MOTION AND INTERACTION OF DECAYING TRAILING VORTICES IN SPANWISE SHEAR WIND**
C. H. LIU and T. LU (New York Univ., New York.) Sep. 1986 26 p
(NASA-TP-2599; L-16040; NAS 1.60:2599) Avail: NTIS HC A03/MF A01 CSCL 01B

A simulation is presented of the drift of trailing vortices in a cross-wind near the ground by an unsteady, two-dimensional, rotational flow field with a concentration of large vorticity in vortical spots (having a finite but small effective size and finite total strength). The problem is analyzed by a combination of the method of matched asymptotic analyses for the decay of the vortical spots and the Euler solution for the unsteady rotational flow. Using the method of averaging, a special numerical method is developed in which the grid size and time step depend only on the length and velocity scales of the background flow and are independent of the effective core size of a vortical spot. The core size can be much smaller than the grid size, whereas the peak velocity in the core is inversely proportional to the spot size. Numerical results are presented to demonstrate the strong interaction between the trajectories of the vortical spots and the change of the vorticity distribution in the background flow field. Author

**INTRODUCTION TO THE RECENT DEVELOPMENTS OF CHINA'S CIVIL AVIATION**
11 Mar. 1986 10 p Transl. into ENGLISH from Hangkong Zhishi (China), no. 1, 1985 p 11-12
(AD-A166194; FTD-ID(RS)T-1165-85) Avail: NTIS HC A02/MF A01 CSCL 01B

The Civil Aviation Administration of China, abbreviated CAAC, is in charge of the whole China civil aviation system. It is different from ordinary airline companies but similar to the Traffic Administration of the Japan Transportation Ministry. Its responsibility includes making policy and regulations for civil aviation, aviation traffic, operation and maintenance of civil airlines, selling of airline tickets and other commodities, management of airports, passenger lounges and anything related to civil aviation. **EFFECTS OF ANISOTROPIC DESIGN ON THE STATIC AEROELASTICITY OF A SWEPT WING**
M. PIENING *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 451-456 1985
Avail: NTIS HC A99/MF E03

A simple structural idealization is adopted to model an arbitrary swept anisotropic wing of moderate to high aspect ratio. The related differential equations are solved for the deformations and internal forces by multiple shooting. The divergence speed is calculated by searching the lowest eingenvalue of the structural matrix formed from the transfer matrices of the wing sections and the according boundary conditions. Parametric evaluations are performed. ESA

## AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**A86-43485#**
**A SECOND-ORDER THEORY FOR THREE-DIMENSIONAL UNSTEADY FLOWS AND ITS APPLICATION TO THIN WINGS WITH ANGLE OF ATTACK AT SUPERSONIC AND HYPERSONIC SPEEDS**
L. HE, Y. HAN, and F. QIAN (Chinese Academy of Sciences, Institute of Mechanics, Beijing, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 585-589. In Chinese, with abstract in English.

**A86-43501#**
**SOME PROBLEMS IN THE FINITE-DIFFERENCE COMPUTATION OF THREE-DIMENSIONAL TRANSONIC FLOWS**
T. CHEN (Beijing Institute of Aerodynamics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, Feb. 1986, p. 104-107. In Chinese, with abstract in English.

The mixed finite-difference relaxation iteration method is applied to the calculation of the wing-body combination with rectangular wings. It is based on the three-dimensional transonic small-disturbance potential equation in the cylinder coordinates. The effect of different computation regions and relaxation parameters (on subsonic points) on the ranges of the computed Mach numbers, angles of attack and calculated results is also studied. It is shown that extending the computation limits brings an increase in the convergence rates of the small-disturbance equation. The convergence rate and computation accuracy are enhanced if the subsonic relaxation parameter is supposed to be 1.9. It is also demonstrated that the calculated results differ when the finite or infinite regions are taken as the computation region of the r-direction. Particularly the distribution of the pressure

coefficients near the wingtip varies as the incident Mach number becomes larger.

### MEASUREMENTS OF FLUCTUATIONS OF SURFACE HEAT TRANSFER RATE IN THE INTERACTING REGION OF OBLIQUE SHOCK WAVE AND TURBULENT BOUNDARY LAYER

M. HAYASHI, S. ASO, and A. TAN (Kyushu University, Fukuoka, Japan) Kyushu University, Technology Reports (ISSN 0023-2718), vol. 58, Dec. 1985, p. 1001-1006. In Japanese, with abstract in English. refs

Fluctuations of surface heat-transfer rate have been measured in the regions of interaction between an oblique shock wave and a turbulent boundary layer. A new type of heat-transfer-rate gage with high spatial resolution and fast response is used. Experiments were made at a nominal Mach number of 4, wall temperature condition Tw/To of 0.56, and Reynolds number of 1.26 x 10 to the 7th based on the distance from the flat-plate leading edge. Measurements were made under separated and unseparated boundary-layer conditions, depending on different incident shock-wave strength. When the boundary layer is separated, significant fluctuations of the heat-transfer rate are observed throughout the interaction region, particularly near the separation point, at the end of the wall pressure plateau, and near the reattachment point. Near the separation point, intermittency is observed in the heat-transfer rate. It changes remarkably with a small length scale. When the boundary layer is unseparated, fluctuations of the heat-transfer rate get strong near the impinging point of the incident shock, but no intermittency is observed. The fluctuations are nearly Gaussian throughout the interaction.

### FLUCTUATIONS OF WALL PRESSURE IN THE INTERACTING REGION OF OBLIQUE SHOCK WAVE AND TURBULENT BOUNDARY LAYER

M. HAYASHI, S. ASO, and A. TAN (Kyushu University, Fukuoka, Japan) Kyushu University, Technology Reports (ISSN 0023-2718), vol. 59, Jan. 1986, p. 75-82. In Japanese, with abstract in English. refs

Fluctuations of wall pressure have been measured in the region of interaction between an oblique shock wave and a turbulent boundary layer. Experiments were made at a nominal Mach number of 4, wall temperature condition Tw/T0 of 0.56, and Reynolds number of 1.26 x 10 to the 7th based on the distance from the flat plate leading edge. When boundary layer is separated, significant fluctuations of wall pressure are observed throughout the interaction region. Near the separation point, intermittency is observed in wall pressure signals. The fluctuations change remarkably with a small length scale. The distribution of intensity of wall pressure fluctuations shows the same tendency as that of the surface heat transfer rate fluctuations. Both of them have a sharp peak near separation point. When the boundary layer is unseparated, the fluctuations of wall pressure show a peak near the impinging point of the incident shock wave, but no intermittency is observed.

### FLOWS PAST A ROTATING CIRCULAR CYLINDER AT HIGH REYNOLDS NUMBER

T. KIMURA and M. TSUTAHARA (Kobe University, Japan) Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 34, April 1986, p. 188-194. In Japanese, with abstract in English. refs

Flows past a rotating circular cylinder at high Reynolds number are investigated by a discrete vortex method. The nascent vortices are introduced to the flowfield at each time step from several points uniformly distributed around and near the surface of the circular cylinder. Calculations are performed for omega = 0.5, and 1.0, where omega is the angular velocity of rotation, and equals the specific speed, i.e., in this case, the ratio of the peripheral velocity to the uniform flow. The results agree qualitatively with experimental results. The reverse Magnus effect, however, due to the transitions of the boundary layers on the upper side and the lower side of the circular cylinder, did not appear, and the simulation for this by the present method seems to be difficult.

### APPLICATION OF UNSTEADY AERODYNAMICS TO LARGE-EDDY BREAKUP DEVICES IN A TURBULENT FLOW

P. BALAKUMAR and S. E. WIDNALL (MIT, Cambridge, MA) Physics of Fluids (ISSN 0031-9171), vol. 29, June 1986, p. 1779-1787. refs
(Contract F49620-83-C-0019)

The modifications to the vertical velocity of a turbulent flow by the large-eddy breakup devices (LEBU) were analyzed using linear three-dimensional unsteady aerodynamics. A Fourier component of the input turbulence convected over these devices was considered and the modified vertical velocity in the far downstream wake was solved. It is shown that the amplitude of the vertical velocity behind the device is reduced, the effect increasing with increasing stream and spanwise wavenumber. Two plates placed far apart in series produce a reduction that is the square of that for a single plate. The presence of the ground plane decreases the effectiveness of the LEBU in reducing the amplitude of the vertical velocity in the far wake.

### THE REVERSE-FLOW THEOREM FOR TRANSONIC FLOW

G. SCHNERR and J. ZIEREP (Karlsruhe, Universitaet, West Germany) IN: Flow of real fluids . Berlin and New York, Springer-Verlag, 1985, p. 17-27. refs

A generalized form of the reverse flow theorem (RFT) is developed for airfoils with contours symmetrical to the maximum thickness in transonic flows and considered for its range of applicability. The prime concern with the RFT is that the pressure drag of the body remain constant even if the flow is reversed, i.e., the drag freezing criterion. The use of the RFT is validated for the hodograph method for double-wedge profiles. A parabolic method is formulated for applying the RFT to a Guderley cusped nose profile. The calculations are extended to supersonic flows. Comparisons with experimental data and Schlieren photographs from a Guderley profile in a shocked wind tunnel illustrate the accuracy of the RFT calculations when the freezing criterion is satisfied.

### ON AERODYNAMIC SOUND GENERATION BY AIRFOIL-VORTEX INTERACTION

F. OBEMEIER (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, West Germany) IN: Flow of real fluids . Berlin and New York, Springer-Verlag, 1985, p. 41-50. refs

An analytical examination is carried out of aerodynamic sound generation by blade vortex interaction, such as happens with helicopter blades, to demonstrate the difficulties in accurately modeling the sound field. The discussion covers the Mach numbers up to transonic flows, concentrating on a single line vortex sweeping past the leading edge of a semi-infinite solid plate in a flow parallel to the plate. Sound field properties dominate in the outer region, away from the leading edge, while hydrodynamical incompressibility effects are most important in the inner region near the leading edge. Models are developed for both fields and approximate expressions are defined for acoustic effects in the far field. A Hamiltonian formalism is used for the vortex path. Compressibility effects in the inner region are considered to extend the model to transonic flows. Further investigations required to characterize the leading edge flow and to equate unsteady vortex motion with sound wave propagation are indicated. M.S.K.

**ON SLENDER VORTICES**
E. KRAUSE (Aachen, Rheinisch-Westfaelische Techische Hochschule, West Germany) IN: Flow of real fluids . Berlin and New York, Springer-Verlag, 1985, p. 211-218.

A numerical model is developed for the breakdown of slender vortices. The model considers the conditions which will permit the vortices to remain slender, noting the necessity of maintaining small axial pressure gradients and limitations on the magnitude of circumferential velocity variations. Local accelerations of the axial velocity components are also permitted. Inviscid theory shows that breakdown is controlled by an axial pressure gradient imposed by the external flow and on a swirl component which causes the flow to become unsteady. Viscosity, although significant in core dissipation, does not have a significant impact on breakdown. M.S.K.

**FAR-FIELD BOUNDARY CONDITIONS FOR TRANSONIC LIFTING SOLUTIONS TO THE EULER EQUATIONS**
J. L. THOMAS and M. D. SALAS (NASA, Langley Research Center, Hampton, VA) AIAA Journal (ISSN 0001-1452), vol. 24, July 1986, p. 1074-1080. refs

Far-field boundary conditions for the Euler equations are formulated and applied to transonic lifting flow over an airfoil in an unbounded domain. An expansion of the linearized small-disturbance equation in the far field is developed and the leading-order term, corresponding to a point vortex representation for the airfoil, is retained. A comprehensive evaluation across the Mach number range of the procedure's effectiveness in eliminating dependence of the numerical results on the boundary extent is presented. Extension of the method to three dimensions is also outlined. Author

**INTEGRATION OF SINGULAR FUNCTIONS ASSOCIATED WITH LIFTING SURFACE THEORY**
B. VAN NIEKERK (Stanford University, CA) AIAA Journal (ISSN 0001-1452), vol. 24, July 1986, p. 1194-1196. refs
(Contract AF-AFOSR-84-0099)

A simple quadrature rule directly applicable to subsonic aerodynamic problems is presented whose main advantage is that it allows kernel function applications to be as conceptually simple as the vortex panel method; this is due to the fact that careful identification and treatment of singularities is unnecessary. The technique may be used to compute time-accurate transient aerodynamic loads on wings. O.C.

**TRANSIENT INDUCED DRAG**
D. WEIHS and J. KATZ (NASA, Ames Research Center, Moffett Field, CA) AIAA Journal (ISSN 0001-1452), vol. 24, July 1986, p. 1203-1205. refs

In the present treatment of the calculation of forces on a wing that is suddenly brought into motion at a constant speed, attention is given to the unsteady potential's contribution to the force balance. Total bound vorticity is produced at the initial impulse. The results obtained are independent of wing aspect ratio; as time increases, this effect on the drag force becomes smaller as the vortex emanating from the trailing edge is left behind. The second contributor to induced drag is the spanwise vorticity shedding that results from the spanwise load distribution of three-dimensional wings. This contribution grows with time as the length of the wake grows. O.C.

**UNIFIED SUPERSONIC/HYPERSONIC SIMILITUDE FOR OSCILLATING WEDGES AND PLANE OGIVES**
K. GHOSH (Indian Institute of Technology, Kanpur, India) AIAA Journal (ISSN 0001-1452), vol. 24, July 1986, p. 1205-1207. refs

The unified supersonic/hypersonic similitude for a wedge and quasi-wedge first reported in abstract form by Ghosh (1983) is presented under the tentative assumption that streamlines are straight. For a steady wedge, the present similitude applies in a plane normal to the shock with exactitude for freestream Mach numbers greater than 1. For a quasi-wedge or an oscillating wedge, another constraint in addition to the Mach number restriction is required. In the hypersonic domain, both similitudes are valid. O.C.

**CALCULATION OF THE POTENTIAL FLOW AROUND WING PROFILES WITH THE AID OF A CONTINUOUSLY DIFFERENTIABLE VORTEX DISTRIBUTION [BERECHNUNG DER POTENTIALSTROEMUNG UM TRAGFLUEGELPROFILE MIT HILFE EINER STETIG DIFFERENZIERBAREN WIRBELBELEGUNG]**
H. JAEGER (Stuttgart, Universitaet, West Germany) (Gesellschaft fuer angewandte Mathematik und Mechanik, Wissenschaftliche Jahrestagung, Dubrovnik, Yugoslavia, April 1-4, 1985) Zeitschrift fuer angewandte Mathematik und Mechanik (ISSN 0044-2267), vol. 66, no. 4, 1986, p. T 228, T 229. In German.

The numerical calculation of the compressible potential flow by means of the field panel procedure involves a combination of a panel procedure with a source distribution of the flow region. The derivatives have to be determined by numerical differentiation. A description is provided of a panel procedure which makes it possible to calculate also the derivatives by a direct approach. The steady flow around a wing profile is considered for the case of an incompressible flow, taking into account a procedure discussed by Jaeger (1984). The occurring curvilinear integrals can be approximated by integrals which can be evaluated analytically. The results provided by the described procedure, involving the case of a continuously differentiable vorticity distribution, are compared with the results of a panel procedure of a higher order. **THE CLASSICAL STREAMLINE CURVATURE METHOD IN THE SUPERSONIC RANGE - A NUMERICALLY ILL-POSED BOUNDARY VALUE PROBLEM**

G. SPINDLER (DFVLR, Institut fuer technische Physik, Stuttgart, West Germany) and H. PAETZOLD (Brown Boveri et Cie AG, Baden, Switzerland) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 10, Mar.-Apr. 1986, p. 107-115. refs

A linear stability analysis of the streamline curvature method using a homogeneous (isentropic) flow model, produces a numerical stability condition, first encountered by Wilkinson. It sets an upper limit on the (relative) Mach number in the supersonic range depending on streamline curve fitting and aspect ratio of the computational grid. Numerical test calculations of the flow in an axially parallel annular duct show that beyond this limit small perturbations of the streamline positions grow. This indicates that convergence to the homogeneous solution can no longer be achieved. Analytical considerations yield infinitely many neighboring solutions in certain cases, proving that the underlying hyperbolic boundary value problem is not properly posed. It is demonstrated that the numerical instability is strongly related to the non-uniqueness of the supersonic flow field. The application of backward differences for the approximation of the streamline curvature is discussed from a mathematical point of view. Author

**ACTIVE SUPPRESSION OF COMPRESSOR INSTABILITIES**

A. H. EPSTEIN, J. E. FFOWCS WILLIAMS, and E. M. GREITZER (MIT, Cambridge, MA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 13 p. NASA-supported research. refs

(AIAA PAPER 86-1914)

A strategy is proposed for controlling aerodynamic instabilities which limit the useful range of both axial and centrifugal turbomachines. Both local and global instabilities (incipient rotating stall and surge) are analyzed. A theory is developed which shows how an additional disturbance, driven from real time data measured within the machine, can be generated so as to realize a device with characteristics fundamentally different from those of the turbomachine without control; for the particular compressor analyzed, the control led to a 20 percent increase in the extent of the stable operating range. The use of structural dynamics to enhance stability is also discussed. K.K.

**CONTROL OF THE DISCRETE VORTICES FROM A DELTA WING**

M. GAD-EL-HAK and R. F. BLACKWELDER (Flow Research Co., Kent, WA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 12 p. refs

(Contract F49620-85-C-0131)

(AIAA PAPER 86-1915)

The modulation of shedding and pairing of discrete vortices is examined. The injection of a secondary fluid is utilized to control the development and strength of the bound-leading-edge vortices on delta wings. Flow visualization and wind tunnel tests were conducted in order to characterize the flow field around a delta wing. A delta wing with a sharp leading edge and a sweep of 60 deg was used in the towing tank and a delta-wing model with a root chord of 40 cm, a 60 deg sweep angle, and a sharp leading edge was employed in the wind tunnel tests. The procedure for perturbing the shear layer at the leading edge of the delta wing is described. The rms, spectral distribution, auto- and cross-correlations, and the probability density function of the velocity field are calculated using the instanteous velocity signal. The effects of the leading edge on the excitations of the shear layer are investigated. The data reveal that the maximum amount of variations in the leading edge vortices occurs when the perturbation frequency is a subharmonic of the natural shedding frequency of the unperturbed wing and when the injection/suction speed is about the same order of magnitude as the ambient velocity. **AN EXPERIMENTAL INVESTIGATION OF WING TIP TURBULENCE WITH APPLICATIONS TO AEROSOUND**

S. A. MCINERNY, W. C. MEECHAM (California, University, Los Angeles), and P. T. SODERMAN (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 21 p. refs
(AIAA PAPER 86-1918)

Wind tunnel tests were carried out to measure the turbulence characteristics of flow in the wing tip region of a blunt tipped NACA 0012 airfoil at 16-, 12-, and 6-deg angles of attack and 75-, 55-, and 35-m/s flow speeds. Results suggest the presence of a well organized turbulence structure with a peak Strouhal number 0.8 to 1.1 based on the wing thickness. At positions near the primary tip vortex on the upper wing surface, high frequency turbulence of lesser intensity was measured. Near-far field correlations reveal that the well-ordered tip turbulence and the separation region surface on the upper surface both radiate significant levels of far field sound. K.K.

**COHERENT LARGE-SCALE STRUCTURES IN HIGH REYNOLDS NUMBER SUPERSONIC JET OF MACH NUMBER 1.4**

J. LEPICOVSKY, K. K. AHUJA, W. H. BROWN, and R. H. BURRIN (Lockheed-Georgia Co., Marietta) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs
(Contract NAS1-17442)
(AIAA PAPER 86-1941)

Large-scale coherent structures are found to exist in fully expanded shock free supersonic jets with Reynolds number 1.6 million and Mach number 1.4. The jet was excited by a weak upstream tone to extract the large-scale structures from the random turbulence. The most preferential excitation Strouhal number is found to be in the vicinity of 0.4, and the dependence of the large-scale structure phase velocity on the excitation Strouhal number shows a similar trend to that found for subsonic acoustically excited jets. R.R.

**AERODYNAMICS VIA ACOUSTICS - APPLICATION OF ACOUSTIC FORMULAS FOR AERODYNAMIC CALCULATIONS**

F. FARASSAT (NASA, Langley Research Center, Hampton, VA) and M. K. MYERS (George Washington University, Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. refs
(AIAA PAPER 86-1877)

Prediction of aerodynamic loads on bodies in arbitrary motion is considered from an acoustic point of view, i.e., in a frame of reference fixed in the undisturbed medium. An inhomogeneous wave equation which governs the disturbance pressure is constructed and solved formally using generalized function theory. When the observer is located on the moving body surface there results a singular linear integral equation for surface pressure. Two different methods for obtaining such equations are discussed. Both steady and unsteady aerodynamic calculations are considered. Two examples are presented, the more important being an application to propeller aerodynamics. Of particular interest for numerical applications is the analytical behavior of the kernel functions in the various integral equations. Author

**MORE ACCURATE SIMULATIONS OF WHOLE AIRCRAFT**

E. J. LERNER Aerospace America (ISSN 0740-722X), vol. 24, July 1986, p. 12, 13.

A full, exact Euler equation simulation of an entire aircraft has been demonstrated for the first time. Previously tradeoffs had to be made: accurate simulation of only a wing for example or greatly simplified simulation of the whole aircraft; in either case, validating wind-tunnel tests of models were required with the incumbent problems of choosing appropriate scaling factors. The new method, by Princeton scientists T. J. Baker, A. Jameson, and N. P. Wetherhill, uses an unstructured grid - one without a set of coordinates. A set of points is built, working outward from each aircraft surface, the points being in the form of an array of tetrahedra (four triangles joined together). A new algorithm was devised to work well without coordinates, so that the grid is defined by each edge of a triangle and the two points opposite it. The simulation program balances energy flow into and out of the two triangles so defined. Bookkeeping is minimized and the program runs just as fast as more approximate methods. In the first demonstration of the program, pressures were calculated on a Boeing 747 airframe, based on 12,000 points; adequate accuracy would require taking 500,000 points and this simulation would require several hours on a Cray MXMP computer (comparable with run times of other simulations). Such simulations will permit engineers not only to develop more intelligent designs prior to wind-tunnel testing but also to focus on problem areas revealed by simulations. D.H.

**SPIRAL VORTEX FLOW OVER A SWEPT-BACK WING**

D. I. A. POLL (Cranfield Institute of Technology, England) Aeronautical Journal (ISSN 0001-9240), vol. 90, May 1986, p. 185-199. Research supported by the Ministry of Defence (Procurement Executive). refs

An experimental investigation has been performed to study the formation and development of spiral vortex flow over a swept-back wing. An aerofoil section with three alternative leading edge shapes was tested at sweep angles ranging from 0 to 56 deg for unit Reynolds numbers of 1,000,000/m and 2,000,000/m. The principal diagnostic tool was the surface oil-flow visualization technique supplemented by pressure distribution measurements in certain cases. No spiral vortex flow was observed for sweep angles of 0 and 15 deg but at higher sweep angles the oil-flows indicated that there were three different mechanisms for the formation of spiral vortices. The angle of incidence at the onset of vortex flow, and the mechanism responsible for its formation, were found to depend upon the sweep angle, the leading edge shape and the Reynolds number. It was also noted that the larger the leading edge radius, the greater the dependence upon Reynolds number. However, comparison with other work suggests that Reynolds number, incidence and sweep angle alone are insufficient to determine the type of spiral vortex flow occurring on a given wing. Author

### MODELING THREE-DIMENSIONAL FLOWS IN TERMS OF VISCOUS-INVISCID INTERACTION BY MEANS OF THE MSZ METHOD [CALCUL D'ECOULEMENTS TRIDIMENSIONNELS PAR INTERACTION VISQUEUX-NON VISQUEUX UTILISANT LA METHODE 'MZM']

M. LAZAREFF and J. C. LE BALLEUR (ONERA, Chatillon-sous-Bagneux, France) (NATO, AGARD, Symposium on Applications of Computational Fluid Dynamics in Aeronautics, Aix-en-Provence, France, Apr. 7-11, 1986) ONERA, TP, no. 1986-29, 1986, 16 p. In French. refs
(ONERA, TP NO. 1986-29)

A multi-zonal marching (MZM) method for solving systems of hyperbolic equations governing viscous fluid layers and modeling turbulent velocity profiles is extended to modeling three-dimensional separated flows over swept wings. The flow equations for a viscous fluid are decomposed into two-dimensional deficit equations for the viscous layer, equations for a perfect fluid, and equations for strong coupling. The concept of thin layers is applied in decomposing the numerical operators before coupling. Defining the viscous deficit equations in closed integral form permits retaining the hyperbolic form of the set of equations and generating a MacCormack space marching solution. Sample results are provided from modeling viscosity by coupling on a transonic wing, the boundary layer on an ellipsoid of revolution and a flattened ellipsoid at 60 deg angles of attack, and of the boundary layer on a glider geometry at a 30 deg angle of attack and 10 deg of sideslip.

### 10 YEARS OF ROTOR FLOWS STUDIES AT ONERA - STATE OF THE ART AND FUTURE STUDIES

A. DESOPPER, P. LAFON, P. CERONI, and J. J. PHILIPPE (ONERA, Chatillon-sous-Bagneux, France) ONERA, TP, no. 1986-49, 1986, 12 p. refs
(ONERA, TP NO. 1986-49)

For about 10 years now, at the Aerodynamics Department of ONERA, experimental and theoretical studies have been performed in order to improve the capability to perform accurate measurements as well as to predict the characteristics of the flow around a helicopter blade. The different phases of the experimental work and analytical studies concerning blade tip planform effects are presented and the main results are analyzed. The results demonstrate that it is possible for high speed rotor blades to define new blade tip shapes that minimize some of the problems due to transonic flows such as the increase of power required, of vibration level or of impulsive noise generated by the rotor. Finally, future studies planned to study the difficult problem of aeroelastic optimization are outlined.

### NUMERICAL CALCULATIONS OF INVISCID TRANSONIC FLOWS OVER WINGS

Z. CHEN, F. YAO, and Y. ZHANG (China Aerodynamics Research and Development Center, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 4, June 1986, p. 184-192. In Chinese, with abstract in English. refs

A numerical method for calculating steady inviscid transonic flows over wings is introduced. The full potential equation is chosen as the mathematical model. The infinite physical domain is transformed to a finite computing domain, and the swept wing is transformed to a rectangular wing using proper mathematical transformation. The equation is discretized in the computing domain using a mixed finite scheme, and the line-relaxation method is used for solving the resulting nonlinear algebraic equation. Successively refining, the mesh makes the calculation very economical.

### HIGH RESOLUTION SOLUTIONS OF THE EULER EQUATIONS FOR VORTEX FLOWS

E. M. MURMAN, K. G. POWELL (MIT, Cambridge, MA), and A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) IN: Progress and supercomputing in computational fluid dynamics; Proceedings of U.S.-Israel Workshop, Jerusalem, Israel, December 1984 . Boston, MA, Birkhaeuser, 1985, p. 93-113. Research supported by Flygtekniska Forsoksanstalten. refs
(Contract NAG1-358)

Solutions of the Euler equations are presented for M = 1.5 flow past a 70-degree-swept delta wing. At an angle of attack of 10 degrees, strong leading-edge vortices are produced. Two computational approaches are taken, based upon fully three-dimensional and conical flow theory. Both methods utilize a finite-volume discretization solved by a pseudounsteady multistage scheme. Results from the two approaches are in good agreement. Computations have been done on a 16-million-word CYBER 205 using 196 x 56 x 96 and 128 x 128 cells for the two methods. A sizable data base is generated, and some of the practical aspects of manipulating it are mentioned. The results reveal many interesting physical features of the compressible vortical flow field and also suggest new areas needing research.

### TRANSONIC NAVIER-STOKES WING SOLUTION USING A ZONAL APPROACH. PART 1: SOLUTION METHODOLOGY AND CODE VALIDATION

J. FLORES, T. L. HOLST, U. KAYNAK (Sterling Software, Palo Alto, Calif.), K. GUNDY, and S. D. THOMAS Apr. 1986 2 p Presented at the AGARD Symposium on Applications of Computational Fluid Dynamics in Aeronautics, Aix En Provence, France, 7-10 Apr. 1986
(NASA-TM-88248; A-86206; NAS 1.15:88248) Avail: NTIS HC A02/MF A01 CSCL 01A

A fast diagonalized Beam-Warming algorithm is coupled with a zonal approach to solve the three-dimensional Euler/Navier-Stokes equations. The computer code, called Transonic Navier-Stokes (TNS), uses a total of four zones for wing configurations (or can be extended to complete aircraft configurations by adding zones). In the inner blocks near the wing surface, the thin-layer Navier-Stokes equations are solved, while in the outer two blocks the Euler equations are solved. The diagonal algorithm yields a speedup of as much as a factor of 40 over the original algorithm/zonal method code. The TNS code, in addition, has the capability to model wind tunnel walls. Transonic viscous solutions are obtained on a 150,000-point mesh for a NACA 0012 wing. A three-order-of-magnitude drop in the L2-norm of the residual requires approximately 500 iterations, which takes about 45 min of CPU time on a Cray-XMP processor. Simulations are also conducted for a different geometrical wing called WING C. All cases show good agreement with experimental data. Author

**AN INVESTIGATION OF TIP PLANFORM INFLUENCE ON THE AERODYNAMIC LOAD CHARACTERISTICS OF A SEMI-SPAN, UNSWEPT WING AND WING-TIP Final Technical Report**

J. M. VANAKEN Dec. 1985 83 p

(Contract NCC2-112)

(NASA-CR-177110; NAS 1.26:177110; CRINC-5171-1) Avail: NTIS HC A05/MF A01 CSCL 01A

A semi-span wing, equipped with an interchangeable tip, which was varied in planform and size was examined. Total wing aerodynamic loading was obtained from the wind tunnel scale system. The wing tip was mounted on a separate six-component strain gauge balance, which provided the aerodynamic loads on the tip. The tests were accomplished in the NASA Ames 7 x 10 foot Wind Tunnel at a Mach number of 0.178. The aerodynamic load characteristics of the wing and of the tip were presented with the tip at several incidence angles relative to the wing inboard section. B.G.

R. MILLER and E. M. MURMAN 16 Jan. 1986 21 p

(Contract NAG2-275)

(NASA-CR-177032; NAS 1.26:177032) Avail: NTIS HC A02/MF A01 CSCL 01A

A number of refinements in the computer code were worked out and tested. Three codes have been written to date. One program is for an isolated wing and is being used to compare with data for the vortex wake (Weston). The second code is for an isolated wing with a streamwise vortex passing above it. This program is being used to validate the computational procedure for incorporating the vortex into the Euler equation calculations. The third program is the hovering rotor code which is the overall objective of the research. The optimization calculations for a hovering helicopter rotor have been completed. Author

**AN EXPERIMENTAL AND ANALYTICAL METHOD FOR APPROXIMATE DETERMINATION OF THE TILT ROTOR RESEARCH AIRCRAFT ROTOR/WING DOWNLOAD Final Report, 30 May 1984 - 30 Nov. 1985**

D. E. JORDON, W. PATTERSON, and D. R. SANDLIN Nov. 1985 116 p

(Contract NCC2-259)

(NASA-CR-176970; NAS 1.26:176970) Avail: NTIS HC A06/MF A01 CSCL 01A

The XV-15 Tilt Rotor Research Aircraft download phenomenon was analyzed. This phenomenon is a direct result of the two rotor wakes impinging on the wing upper surface when the aircraft is in the hover configuration. For this study the analysis proceeded along tow lines. First was a method whereby results from actual hover tests of the XV-15 aircraft were combined with drag coefficient results from wind tunnel tests of a wing that was representative of the aircraft wing. Second, an analytical method was used that modeled that airflow caused gy the two rotors. Formulas were developed in such a way that acomputer program could be used to calculate the axial velocities were then used in conjunction with the aforementioned wind tunnel drag coefficinet results to produce download values. An attempt was made to validate the analytical results by modeling a model rotor system for which direct download values were determinrd.. Author

**VORTEX SHEET MODELING WITH HIGHER ORDER CURVED PANELS Ph.D Thesis Final Technical Report**

M. G. NAGATI 1985 115 p

(Contract NCC2-19)

(NASA-CR-176971; NAS 1.26:176971) Avail: NTIS HC A06/MF A01 CSCL 01A

A numerical technique is presented for modeling the vortex sheet with a deformable surface definition, along which a continuous vortex strength distribution in the spanwise direction is applied, so that by repeatedly modifying its shape, its true configuration is approached, in the proximity of its generating wing. Design problems requiring the inclusion of a realistic configuration of the vortex sheet are numerous. Examples discussed include: control effectiveness and stability derivatives, longitudinal stability, lateral stability, canards, propellers and helicopter rotors, and trailing vortex hazards. B.G.

**CORRELATION OF TRANSONIC-CONE PRESTON-TUBE DATA AND SKIN FRICTION Final Report, Nov. 1980 - May 1984**

A. S. ABU-MOSTAFA and T. D. REED May 1984 104 p

(Contract NAG2-76)

(NASA-CR-176902; NAS 1.26:176902) Avail: NTIS HC A06/MF A01 CSCL 01A

Preston-tube measurements obtained on the Arnold Engineering Development Center (AEDC) Transition Cone have been correlated with theoretical skin friction coefficients in transitional and turbulent flow. This has been done for the NASA Ames 11-Ft Transonic Wind Tunnel (11 TWT) and flight tests. The developed semi-empirical correlations of Preston-tube data have been used to derive a calibration procedure for the 11 TWT flow quality. This procedure has been applied to the corrected laminar data, and an effective freestream unit Reynolds number is defined by requiring a matching of the average Preston-tube pressure in flight and in the tunnel. This study finds that the operating Reynolds number is below the effective value required for a match in laminar Preston-tube data. The distribution of this effective Reynolds number with Mach number correlates well with the freestream noise level in this tunnel. Analyses of transitional and turbulent data, however, did not result in effective Reynolds numbers that can be correlated with background noise. This is a result of the fact that vorticity fluctuations present in transitional and turbulent boundary layers dominate Preston-tube pressure fluctuations and, therefore, mask the tunnel noise effects. So, in order to calibrate the effects of noise on transonic wind tunnel tests only laminar data should be used, preferably at flow conditions similar to those in flight tests. To calibrate the effects of transonic wind-tunnel noise on drag measurements, however, the Preston-tube data must be supplemented with direct measurements of skin friction. M.G.

**EXPERIMENTAL AND THEORETICAL STUDY OF PROPELLER SPINNER/SHANK INTERFERENCE M.S. Thesis**

C. C. CORNELL May 1986 143 p
(Contract NAS3-272)
(NASA-CR-176954; NAS 1.26:176954) Avail: NTIS HC A07/MF A01 CSCL 01A

A fundamental experimental and theoretical investigation into the aerodynamic interference associated with propeller spinner and shank regions was conducted. The research program involved a theoretical assessment of solutions previously proposed, followed by a systematic experimental study to supplement the existing data base. As a result, a refined computational procedure was established for prediction of interference effects in terms of interference drag and resolved into propeller thrust and torque components. These quantities were examined with attention to engineering parameters such as two spinner finess ratios, three blade shank forms, and two/three/four/six/eight blades. Consideration of the physics of the phenomena aided in the logical deduction of two individual interference quantities (cascade effects and spinner/shank juncture interference). These interference effects were semi-empirically modeled using existing theories and placed into a compatible form with an existing propeller performance scheme which provided the basis for examples of application. **PSEUDO-TIME ALGORITHMS FOR THE NAVIER-STOKES EQUATIONS**

R. C. SWANSON and E. TURKEL (Tel-Aviv Univ. (Israel).) May 1986 33 p
(Contract NAS1-17070; NAS1-18107)
(NASA-CR-178127; ICASE-86-37; NAS 1.26:178127) Avail: NTIS HC A03/MF A01 CSCL 01A

A pseudo-time method is introduced to integrate the compressible Navier-Stokes equations to a steady state. This method is a generalization of a method used by Crocco and also by Allen and Cheng. We show that for a simple heat equation that this is just a renormalization of the time. For a convection-diffusion equation the renormalization is dependent only on the viscous terms. We implement the method for the Navier-Stokes equations using a Runge-Kutta type algorithm. This permits the time step to be chosen based on the inviscid model only. We also discuss the use of residual smoothing when viscous terms are present. Author

**AN ENTROPY CORRECTION METHOD FOR UNSTEADY FULL POTENTIAL FLOWS WITH STRONG SHOCKS**

W. WHITLOW, JR., M. M. HAFEZ (California Univ., Davis.), and S. J. OSHER (California Univ., Los Angeles.) Jun. 1986 14 p
(NASA-TM-87769; NAS 1.15:87769) Avail: NTIS HC A02/MF A01 CSCL 01A

An entropy correction method for the unsteady full potential equation is presented. The unsteady potential equation is modified to account for entropy jumps across shock waves. The conservative form of the modified equation is solved in generalized coordinates using an implicit, approximate factorization method. A flux-biasing differencing method, which generates the proper amounts of artificial viscosity in supersonic regions, is used to discretize the flow equations in space. Comparisons between the present method and solutions of the Euler equations and between the present method and experimental data are presented. The comparisons show that the present method more accurately models solutions of the Euler equations and experiment than does the isentropic potential formulation. Author

**BOUNDARY LAYER STABILITY MEASUREMENTS OVER A FLAT PLATE AT MACH 3 Final Report**

A. DEMETRIADES Nov. 1985 203 p
(Contract AF-AFOSR-0267-80)
(AD-A166188; SWT-TR-85-1; AFOSR-86-0056TR) Avail: NTIS HC A10/MF A01 CSCL 20D

Amplification of natural disturbances in a flat plate laminar boundary layer at edge Mach number 3 have been measured in a supersonic wind tunnel with and without turbulent sidewall boundary layers. Detailed flowfield measurements were made to define the self-similar region and the point where the velocity profile first departs from the Blasius theory. The first instability mode was detected with a minimum critical momentum Reynolds number of 190 and a maximum amplified frequency of 0.000225. Amplification rates for this mode agree with the available theoretical predictions, and its low-frequency, low-R region is not as distorted by monotonic amplification as previously thought. A second, very prominent and extensive instability was found which extends to much higher frequencies beyond F = 0.00035 and which dominates the pretransitional flow. The neutral branch location of this mode associates it with the second instability mode found in hypersonic flow and serves to clarify and present a stability diagram rational over the M = 0 to 8 range. The overall amplitude gain before the first departure is still confined to low frequencies with the first mode contributing little net gain, the combined first-second modes contributing a gain of about 3, while an additional factor of 5 to 10 is provided by a mechanism active near the leading edge and apparently consistent with Mack's forcing-stability approach. **AN INVESTIGATION OF TURBULENCE MECHANISMS IN V/STOL UPWASH FLOW FIELDS Final Report, Mar. 1982 - Jun. 1985**

B. GILBERT 15 Sep. 1985 94 p
(Contract F49620-82-C-0025)
(AD-A166286; RE-707; AFOSR-86-0096TR) Avail: NTIS HC A05/MF A01 CSCL 20D

This report presents results of an experimental investigation of the abnormally high turbulent mixing layer growth rate characteristics found in the upwash regions of V/STOL flows in ground effect. The fundamental turbulent V/STOL upwash mechanisms were investigated in increasingly more complex flow configurations. Most of this study uses the two-dimensional upwash formed by the collision of opposed two-dimensional wall jets. Initial parameters used to characterize the upwash formation were identified as the maximum wall jet velocity and wall jet half velocity width. Upwash measurements were taken in flows formed from equal wall jets with the same maximum velocities and equal wall jets with the same half widths. While mixing layer growth rates were larger than those found in a free two-dimensional jet, these values were less than those previously reported. An explanation based on non-similarity conditions in the flow is offered. Abnormally high turbulence levels reported by other investigators were not found. The increased growth rate seem to be a direct effect of the head-on collision process. There is an indication that in the far field the upwash growth characteristics are approaching those found in free jets which has profound implications to the turbulence modelers. GRA

(ONERA-RT-24/3064-RY-044-R; ESA-86-97276) Avail: NTIS HC A03/MF A01

Variations of the critical lift velocity in transonic flow (Mach 0.8) was studied. A first method is based on a linear computation of the corrections to perform on wind tunnel steady flow pressure measurements. A second nonlinear method is based on the analysis of small perturbations which take in account the deformations and the exact profile of the model. The comparison shows that both methods are close to the experimental results. ESA

**TRANSONIC EQUIVALENT STRIP METHOD FOR AEROELASTIC APPLICATIONS**

D. D. LIU, Y. F. KAO, and K. Y. FUNG (Arizona Univ., Tucson) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 17-32 1985 Sponsored by DTNSRDC/NAVAIR
Avail: NTIS HC A99/MF E03

For unsteady flow computations of arbitrary wing planforms including control surfaces, a method based on the transonic equivalent strip (TES) model is developed. It consists of two consecutive correction steps to a given unsteady two-dimensional code. The latter can be a time-linearized transonic code or a nonlinear one such as LTRAN2 code. The mean-flow correction step involves an equivalent airfoil design procedure; the spanwise phase correction step accounts for the effects of acoustic wave propagation in three dimensions. Computed results using the TES method are compared with those obtained by methods such as versions of XTRAN3 code, Isogai's full potential code, and measured data. Computed cases include the Northrop F-5 wing in pitching oscillation, the AGARD standard RAE wing with an oscillating flap, and the LANN wing in pitching oscillation. ESA

**EXACT CLOSED-FORM SOLUTIONS FOR NONLINEAR UNSTEADY TRANSONIC AERODYNAMICS**

G. A. OYIBO *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 71-78 1985
Avail: NTIS HC A99/MF E03

The existence of exact closed-form solutions for nonlinear unsteady aerodynamics is established. The full nonlinear unsteady velocity potential equations for an airfoil are considered. Evidence indicating why the traditional hodograph approach is ineffective for solving these equations is provided. A mapping scheme transforms these full nonlinear equations into the hodograph plane. Examination of the resulting hodograph equations reveals that by prescribing the Jacobian of the transformation, ab initio, the exact closed-form solutions can be obtained for the nonlinear unsteady aerodynamic characteristics of an airfoil in a potential flow. The shockless transonic results for inviscid analysis show trends that agree with previous data. Dips are observed in the pressure distributions as the free stream Mach number is varied. There are finite optimum reduced frequencies (Strouhal numbers) for the pressure distributions. This suggests a solution to the transonic dip problem associated with aeroelastic stability characteristics at transonic Mach numbers. ESA

**AN EXACT FORMULATION OF THE UNSTEADY AERODYNAMIC THEORY OF LIFTING SURFACES UNDERGOING ARBITRARY SMALL MOTIONS IN A SUPERSONIC FLOW FIELD**

L. LIBRESCU *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 163-168 1985
Avail: NTIS HC A99/MF E03

The indirect theory of unsteady lifting surfaces is developed. The integral equation (IE) relating a known downwash distribution to an unknown pressure distribution is derived without any restriction on the time dependence of field variables. The IE for simple harmonic motions and arbitrary small motions starting from rest at a certain time are obtained. In the latter case, the theory of generalized functions is used to derive the appropriate integral equation, by incorporating the associated initial conditions, and by highlighting properties of the aerodynamic kernel such as causality. The relationship between the aerodynamic kernels in the time and frequency domains is established. The problem analyzed is useful in the evaluation of the structural response of flight vehicles as well as in the active control problem of aeroelastic response. ESA

**ANISOTROPIC WING AEROELASTIC THEORIES WITH WARPING EFFECTS**

G. A. OYIBO and J. H. BERMAN *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 434-440 1985
Avail: NTIS HC A99/MF E03

The influence of warping (spanwise axial constraints on wing twist) on anisotropic wing aeroelastic oscillations is investigated using a similarity rule approach. Results show that a high aspect ratio anisotropic wing could behave aeroelastically like a low aspect ratio wing and vice-versa. Similarity parameters derived in the analysis expose conditions for which this might happen. The analysis also indicates that the parameter that is currently used in determining when warping is important (or when not to use the St Venant's torsion theory) is inaccurate for anisotropic wings. The correct parameter is presented. ESA

**THE METHOD OF COMPLEX CHARACTERISTICS FOR DESIGN OF TRANSONIC BLADE SECTIONS Research and Development Report**

M. R. BLEDSOE Jun. 1986 203 p
(Contract NAG2-345; DE-AC02-76ER-03077; NSF DMS-83-20430)
(NASA-CR-176978; NAS 1.26:176978; DOE/ER-03077/273)
Avail: NTIS HC A10/MF A01 CSCL 01A

A variety of computational methods were developed to obtain shockless or near shockless flow past two-dimensional airfoils. The approach used was the method of complex characteristics, which determines smooth solutions to the transonic flow equations based on an input speed distribution. General results from fluid mechanics are presented. An account of the method of complex characteristics is given including a description of the particular spaces and coordinates, conformal transformations, and numerical procedures that are used. The operation of the computer program COMPRES is presented along with examples of blade sections designed with the code. A user manual is included with a glossary to provide additional information which may be helpful. The computer program in Fortran, including numerous comment cards is listed. B.G.

With the renewed interest in propellers as means of obtaining thrust and fuel efficiency in addition to the increased utilization of the computer, a significant amount of progress was made in the development of theoretical models to predict the performance of propeller systems. Inherent in the majority of the theoretical performance models to date is the need for airfoil data banks which provide lift, drag, and moment coefficient values as a function of Mach number, angle-of-attack, maximum thickness to chord ratio, and Reynolds number. Realizing the need for such data, a study was initiated to provide airfoil data banks for three commonly used airfoil families in propeller design and analysis. The families chosen consisted of the Clark-Y, NACA 16 series, and NACA 4 digit series airfoils. The various component of each computer code, the source of the data used to create the airfoil data bank, the limitations of each data bank, program listing, and a sample case with its associated input-output are described. Each airfoil data bank computer code was written to be used on the Amdahl Computer system, which is IBM compatible and uses Fortran.

**COMPARISON OF EXPERIMENTAL SURFACE PRESSURES WITH THEORETICAL PREDICTIONS ON TWIN TWO-DIMENSIONAL CONVERGENT-DIVERGENT NOZZLES**
J. R. CARLSON, O. C. PENDERGRAFT, JR., and J. R. BURLEY, II Aug. 1986 31 p Presented at the AIAA 4th Applied Aerodynamics Conference, San Diego, Calif., 9-11 Jun. 1986
(NASA-TM-87757; NAS 1.15:87757; AIAA-86-1803-CP) Avail: NTIS HC A03/MF A01 CSCL 01A

A three-dimensional subsonic aerodynamic panel code (VSAERO) was used to predict the effects of upper and lower external nozzle flap geometry on the external afterbody/nozzle pressure coefficient distributions and external nozzle drag of nonaxisymmetric convergent-divergent exhaust nozzles having parallel external sidewalls installed on a generic twin-engine high performance aircraft model. Nozzle static pressure coefficient distributions along the upper and lower surfaces near the model centerline and near the outer edges (corner) of the two surfaces were calculated, and nozzle drag was predicted using these surface pressure distributions. A comparison between the theoretical predictions and experimental wind tunnel data is made to evaluate the utility of the code in calculating the flow about these types of non-axisymmetric afterbody configurations. For free-stream Mach numbers of 0.60 and 0.90, the conditions where the flows were attached on the boattails yielded the best comparison between the theoretical predictions and the experimental data. For the Boattail terminal angles of greater than 15 deg., the experimental data for $M = 0.60$ and 0.90 indicated areas of separated flow, so the theoretical predictions failed to match the experimental data. Even though calculations of regions of separated flows are within the capabilities of the theoretical method, acceptable solutions were not obtained.

**EXPERIMENTAL AND NUMERICAL RESULTS FOR A GENERIC AXISYMMETRIC SINGLE-ENGINE AFTERBODY WITH TAILS AT TRANSONIC SPEEDS**
J. R. BURLEY, II, J. R. CARLSON, and W. P. HENDERSON Aug. 1986 20 p Presented at the AIAA 4th Applied Aerodynamics Conference, San Diego, Calif., 9-11 Jun. 1986
(NASA-TM-87755; NAS 1.15:87755; AIAA-86-1797-CP) Avail: NTIS HC A02/MF A01 CSCL 01A

Static pressure measurements were made on the afterbody, nozzle and tails of a generic single-engine axisymmetric fighter configuration. Data were recorded at Mach numbers of 0.6, 0.9, and 1.2. NPR was varied from 1.0 to 8.0 and angle of attack was varied from -3 deg. to 9 deg. Experimental data were compared with numerical results from two state-of-the-art computer codes.

(Contract NCC2-355)
(NASA-CR-179655; NAS 1.26:179655) Avail: NTIS HC A06/MF A01 CSCL 01A

A numerical tool is constructed to examine the effects of a porous surface on transonic airfoil performance and to help understand the flow structure of passive shockwave/boundary layer interactions. The porous region is located near the shock with a cavity underneath it. This study is composed of two parts. Solved in the first part, with an inviscid-flow approach, is the transonic full-potential equation associated with transpiration boundary conditions which are obtained from porosity modeling. The numerical results indicate that a porous airfoil has a wave drag lower than that of a solid airfoil. The observed lambda-shock structure in the wind-tunnel testing can be predicted. Furthermore, the lift could be increased with an appropriate porosity distribution. In the second part of this work, the modified version of either an interactive boundary layer (IBL) algorithm or a thin-layer Navier-Stokes (TLNS) algorithm is used to study the outer flow, while a stream-function formulation is used to model the inner flow in the shallow cavity. The coupling procedure at the porous surface is based on Darcy's law and the assumption of a constant total pressure in the cavity. In addition, a modified Baldwin-Lomax turbulence model is used to describe the transpired turbulent boundary layer in the TLNS approach, while the Cebeci turbulence model is used in the IBL approach. According to the present analysis, a porous surface can reduce the wave drag appreciably, but can also increase the viscous losses. As has been observed experimentally, the numerical results indicate that the total drag is reduced at higher Mach numbers and increased at lower Mach numbers when the angles of attack are small. Furthermore, the streamline pattern of passive shock/boundary layer interaction are revealed.

The report describes progress in research directed towards the efficient solution of the inviscid Euler and Reynolds-averaged Navier-Stokes equations for transonic flows through engine inlets, and past complete aircraft configurations, with emphasis on the flowfields in the vicinity of engine inlets. The research focusses upon the development of solution-adaptive grid procedures for these problems, and the development of multi-grid algorithms in conjunction with both, implicit and explicit time-stepping schemes for the solution of three-dimensional problems. The work includes further development of mesh systems suitable for inlet and wing-fuselage-inlet geometries using a variational approach. Work during this reporting period concentrated upon two-dimensional problems, and has been in two general areas: (1) the development of solution-adaptive procedures to cluster the grid cells in regions of high (truncation) error;and (2) the development of a multigrid scheme for solution of the two-dimensional Euler equations using a diagonalized alternating direction implicit (ADI) smoothing algorithm. **PAN AIR APPLICATION TO THE F-106B**
F. GHAFFARI Aug. 1986 60 p
(Contract NAS1-17919)
(NASA-CR-178165; NAS 1.26:178165) Avail: NTIS HC A04/MF A01 CSCL 01A

The PAN AIR computer code was employed in the present study to investigate the aerodynamic effects of the various geometrical changes and flow conditions on a configuration similar to the F-106B half-airplane tested in the Langley 30x60-foot wind tunnel. The various geometries studied included two forebodies (original and shortened), two inlet flow conditions (open and closed) two vortex flap situations (off and on). The attached flow theoretical solutions were obtained for Mach number of 0.08 and angle of attack of 8 deg., 10 deg., 12 deg., and 14 deg. In general this investigation revealed that the shortening of the forebody or closing of the inlet produced only a small change in the overall aerodynamic coefficients of the basic F-106B configuration throughout the examined angles of attack. However, closing the inlet of the configuration resulted in a slightly higher drag level at low angles of attack. Furthermore, at and above 10 deg. angle of attack, it was shown that the presence of the vortex flap causes an increase in the total lift and drag. Also, these theoretical results showed the expected reduction in longitudinal stability level with addition of the vortex flap to the basic F-106B configuration. Author

An air-on demonstration of the Captive Trajectory Support (CTS) system was conducted in the AEDC Propulsion Wind Tunnel (16T). The test objectives were: (1) to demonstrate the structural integrity of the CTS system; (2) to demonstrate the ability of the CTS system to satisfactorily obtain grid and trajectory generation data for a typical store model in free stream and relative to a simulated (flat plate) aircraft in a dynamic wind tunnel environment; (3) to obtain a Mach number calibration for the Tunnel 16T Cart 2 (Multipurpose Cart) with the CTS system installed. The 1/4-scale Maximum Volume Bomb (MVB) was used to represent a typical store. Data were obtained at free-stream numbers from 0.6 to 1.6 and at various compressor ratios. GRA

**THE FIRE-HARD AIRLINER**
J. M. RAMSDEN Flight International (ISSN 0015-3710), vol. 129, May 17, 1986, p. 27-30.

The complex problems posed by airliner cabin fires are examined and the continuing search for even more fire-resistant materials is described. In 25 years the airlines have suffered about 50 cabin fires in the air, of which fewer than half have been fatal. This is a fatal cabin-fire rate of only one per 10,000,000 flights. Three tragic fires are described. At Riyadh in 1980, all 301 occupants of a Saudi TriStar died when a flashover of combustible gases ran through the cabin when engines and air conditioning were shut down after an emergency landing. In Manchester, England, British Airways 737 caught fire on takeoff; blazing fuel melted the fuelage and 55 of the 137 occupants died, most of them from hydrogen cyanide or carbon monoxide gases or 'black ash' emitted by burning cabin furnishings. Approaching Greater Cincinnati, in 1983, an Air Canada DC-9 had a fire aboard smoldering for almost 15 minutes before being discovered; during the emergency landing, acrid black smoke filled the cabin but it only ignited a minute after the doors and exits had been opened on landing; half of the 46 occupants died. A major question in fire hardening is whether to try to make cabin furnishing harder to ignite (noting that all plastics do burn) or to try to find materials that emit gases that are less toxic when they are burning. Topics covered include: plastic materials, wool, fireblockers, tests (Airbus and Boeing standards, FAA rulemaking - NPRM 85-10), and structure (aircraft skin, sidewalls, ceiling, windows, fuel tanks). **1985 USAF EJECTION SUMMARY**
R. C. DELGADO (USAF, Directorate of Aerospace Safety, Norton AFB, CA) SAFE Journal, vol. 16, no. 2, Summer 1986, p. 16, 17.

An analysis of the USAF ejection statistics for the 58 crewmembers involved in escape-system-equipped aircraft mishaps during 1985 is presented. An 81 percent ejection survival rate from the 43 attempted ejections (the lowest number of ejections since 1950) is found. Six out of eight of the fatalities were due to out-of-envelope ejection, involving three in F-4s, two in a T-38, and one in an F-16. Specific ejection mishaps are discussed, and recommendations are made. R.R.

**AUTOMATIC INFLATION MODULATION (A.I.M.) PARACHUTE UP-DATE**
D. B. WEBB (Irvin Industries Canada, Ltd., Fort Erie) SAFE Journal, vol. 16, no. 2, Summer 1986, p. 38-45. refs

The current status of the AIM parachute and parachute system testing in each of the Martin Baker MK.12, the Stencel S4S and the McDonnell Douglas ACES II ejection seats is reviewed. The benefits of deploying the main canopy at the highest possible speed are discussed, together with the necessary structural integrity and inflation control requirements. Results of additional environmental testing of the stretch fabric used in the AIM canopy crown area (for relief of inflation loads) are included, which show that it closely follows the standard MIL-C-7020 parachute cloth results. **SNIFFING OUT TROUBLE**
H. HOPKINS Flight International (ISSN 0015-3710), vol. 129, June 28, 1986, p. 24-26.

The 'Condor' contraband detector system is a mobile explosives and illegal drugs cargo inspection apparatus for use at airports against smugglers and terrorists. The entire system is contained in two installations through which cargo vehicles pass on a conveyor belt, with an inspection capacity of around 100 tonnes/hr. Luggage does not have to be unpacked for inspection. Condor is housed in a 30-ft-long trailer, and is currently priced at over 2 million pounds sterling. Operations are conducted by two personnel, one of whom works outside it on the actual sampling manipulations while the other is inside, monitoring the analysis functions. O.C.

On June 25, 1985, a Cessna Model 150 airplane, N704ZS, sustained substantial damage after a loss of engine power in flight forced the pilot to execute an emergency landing at Rushville, Missouri. The National Transportation Safety Board's investigation of the accident disclosed that the power loss occurred because a self-locking nut became disengaged from the bolt that connects the throttle cable rod end to the carburetor throttle arm, permitting the bolt to back out of the bolt hole. Since January 1, 1980, throttle linkages have become disconnected from carburetor throttle arms for similar reasons on seven other Cessna Model 150 airplanes. Additionally, the loss of connecting hardware has caused the separation of engine throttle or mixture controls on Cessna Model 152, 172, 177RG, A188, and U206 airplanes, resulting in six accidents, one incident, and eight service difficulty reports. On July 16, 1984, a Hiller Aviation UH-12E helicopter, N1043L, crashed while engaged in an agricultural spraying operation near Redmond, Oregon. The helicopter was destroyed. The pilot, the sole occupant, received minor injuries. The investigation by the National Transportation Safety Board revealed that an outboard section of main rotor blade had separated in flight. Subsequent detailed examination of the fractured surfaces of main rotor blade spar in the Safety Board's metallurgical laboratory revealed that a fatigue crack had propagated through 80 percent of the spar cross section prior to separation. The fatigue crack originated at the interface between the spar lower surface leading edge and the external spar doubler. The failed blade was manufactured by the Parsons Company, a Hiller Aviation vendor, in the 1960's. The Safety Board understands that this was the fourth such blade failure since the AD was issued. All four failures reportedly occurred when the blades had accumulated about 4,000 hours, although the approved service life of the PN 2253-1101-04 blade is 6,600 hours. The inspection now being conducted at 100-hour intervals apparently is not adequate to identify fatigue crack propagation originating at the interface between the spar lower surface leading edge and the external spar doubler. The Safety Board concludes that a one-time inspection using ultrasonic or eddy current techniques should be imposed on the remaining Parsons main rotor blades with more than 3,000 hours of accumulated time, in addition to the existing AD requirement. Data from this one-time inspection program should be evaluated to determine if any further nondestructive tests are necessary or if the approved service life of the blades should be reduced. Author

**TASK FORCE REPORT ON EMERGENCY EVACUATION OF TRANSPORT AIRPLANES, VOLUME 1 Final Summary Report**
Jul. 1986 109 p
(DOT/FAA/VS-86/1.1) Avail: NTIS HC A06/MF A01

This is one of two volumes that report on the study of the emergency evacuation of transport airplanes that was sponsored by the Federal Aviation Administration (FAA). The study included the September 1985 Public Technical Conference and the public meetings of the three technical working groups formed during the conference as part of a task force effort. The working groups are: Design and Certification, Training and Operations, and Maintenance and Reliability. The task force program focused on the reassessment of existing Federal Aviation Regulations pertaining to emergency evacuation. Topics considered in the study include: evacuation demonstrations; emergency exits; evacuation slide certification, inspection, and maintenance; emergency equipment; crewmember training and duties; passenger safety information; air carrier operations; and others. Volume I, Summary Report, summarizes the issues considered during the study and the outcome of those issues. Volume II, Supporting Documentation, contains meeting reports, formal presentation papers, and other documents on which the summary report is based. Author

**HALON EXTINGUISHER AGENT BEHAVIOR IN A VENTILATED SMALL AIRCRAFT Final Report, Mar. - Jul. 1984**
G. R. SLUSHER, J. WRIGHT, and J. E. DEMAREE Jun. 1986 53 p
(DOT/FAA/CT-86/5) Avail: NTIS HC A04/MF A01

Hand held fire extinguishers (Halon 1211 and Halon 1301) were evaluated in a four-passenger Cessna Model 210C aircraft. The aircraft was operated in the FAA's Technical Center airflow facility under simulated flight conditions. Extinguishers were discharged without fires to determine the dissipation rate and toxicity levels of Halon extinguishing agents. Agent concentrations dissipated rapidly. Analysis of dose calculations demonstrated that 2.5 pound Halon 1211 and 3.0 pound Halon 1301 extinguishers were safe in the four-passenger test aircraft. Dose calculations for the pilot were a maximum of 60 percent of the limit for Halon 1211, and maximum dose was 31 percent of the limit for Halon 1301. Stratification of the Halons together with cabin ventilation resulted in safe conditions for the pilot. Distribution of extinguishing agents under the instrument panel was investigated. When the extinguishers were discharged on either the pilot's or the copilot's side, four percent concentration was measured on the side opposite of the discharge of the extinguishers. Extinguisher gas stratification was determined by measuring agent levels on the cabin floor. Author

During 1983 and 1984, Systems Control Technology, Inc. conducted a country-wide survey of civil helicopter pilot organizations involved in a wide range of helicopter operations for the purpose of determining the hazards of the latter and the root causes of the high rate of helicopter accidents. The survey was conducted through personal interviews, meetings, and questionnaires. The questionnaire included census data, profiles of the pilot work environment and procedures,and their own perspectives on the hazards of helicopter operations and causes of helicopter accidents. These data were compared with historical National Transportation Safety Board accident reports and accident briefs to determine more specifically the causes of helicopter accidents. The results of the analysis include a list of hazards and probable causes of accidents, as well as technological, training and standardization remedies.

Work of Meyer and Cicolani was adapted for application to open seat escape systems in current Air Force fighter aircraft. The control system design is a fully self-contained system whose major on-seat components are: acceleration, rate, attitude and altitude sensors, real-time control logic imbedded on a microprocessor chip, rocket thrusters with thrust vectoring and throttling capability, and various avionics and support subsystem hardware items (e.g., power supply). The control concept is based on a comparison of measured translational and rotational accelerations with desired values; the propulsion system is then configured to provide adequate energy to follow the desired trajectory and simultaneously eliminate acceleration errors. The concept uses nonlinear models and incorporates state and control constraints. This volume contains the detailed documentation of specification development, control logic design, hardware identification, and trade study efforts. Volume II (Ad-A166 596) contains a description of the prototype design, real time breadboard simulation, and the results and analysis of the verification task. Volume III contains the supporting appendices for volumes I and II. Volume IV details the results of the real time hybrid computer simulation effort.

**AMINE-CO2 ADDUCTS AS AVIATION FUEL GELLING AGENTS**
W. W. BANNISTER *In* FAA Proceedings of Fuel Safety Workshop p 279-298 31 Dec. 1985
Avail: NTIS HC A17/MF A01 CSCL 21D

On addition of small amounts of cyclododecylamine (CDDN) to jet fuels, with subsequent addition of CO2, a zwitterionic carbamate forms to set up a gelling matrix within the fuel. This system is proposed for application in controlled crash landings in which the crew would have one or two second to undertake fire-prevention measures. There is also a possibility for use in very low non-gelling concentrations which may still provide antimisting kerosene (AMK) characteristics, in which case there would be no weight penalties and no reaction time would be required. Use with other additives may provide synergistic effects. Cost estimates, payload requirements, heat of combustion and NOx emission data are included. Author

**JET FUEL VISCOSITY AT LOW TEMPERATURES WITH NOTES ON N-ALKALINE CRYSTALS Final Report**
D. SCHRUBEN *In* FAA Proceedings of Fuel Safety Workshop p 317-356 31 Dec. 1985
(Contract NAG3-488)
(NASA-CR-174911; NAS 1.26:174911) Avail: NTIS HC A17/MF A01 CSCL 21D

Apparatus and procedures were developed to collect jet fuel viscosity versus temperature data for temperatures down to about -60 deg C in a manner compatible with prior jet fuel data bases generated with the Brookfield viscometer. Viscosity data showed good reproducibility even at temperatures a few degrees into the two-phase region. The viscosity-temperature relationship could be correlated by two linear segments when plotted as a standard log-log type representation. The breakpoint between the high and low temperature line segments is the filter flow temperature, a fuel characteristic approximated by the freezing point. A generalized correlation appears sufficiently accurate for many design or performance calculations. In the low temperature two-phase region, wax precipitation is significant. Qualitative literature was quantitatively analyzed along with data in this study to plot crystal size versus composition for the fuel model C sub 20-C sub 24 n-alkane system in solvent. This suggested that wax mixtures tend towards smaller crystal sizes than pure wax species. Complex mixtures in jet fuels lead to two-phase states, at least in some instances, that have small enough crystals to be treated as a continuum. Author

(DOT/FAA/CT-85/25; TR-85413) Avail: NTIS HC A11/MF A01

The results of the Federal Aviation Administration (FAA) seat experiments tested in the joint FAA/NASA Controlled Impact Demonstration (CID) are described. Twenty-three seats were placed on the test aircraft. Thirteen seats were modifications of existing transport seats which were designed structurally to improve their crashworthiness. The remaining experiments were unmodified standard seats which included seven light and heavy-weight forward-facing seats, two aft-facing seats, and one flight attendant seat. Three additional seat experiments were placed onboard the test aircraft: two by NASA, and one by a private contractor. Onboard instrumentation was placed at specific locations to obtain data pertaining to airframe structural loads and seat/occupant response. Accelerometers were attached to the airframe and floor structure, the seat experiments, and the anthropomorphic dummies occupying the seats. The data base resulting from the test was intended for validating crash prediction models and occupant/seat dynamic simulation models. Author

**AIRCRAFT ACCIDENT REPORT: PROVINCETOWN, BOSTON AIRLINES FLIGHT 1039, EMBRAER BANDEIRANTE, EMB-110P1, N96PB, JACKSONVILLE, FLORIDA, DECEMBER 6, 1984**
24 Jun. 1986 100 p
(PB86-910405; NTSB/AAR-86/04) Avail: NTIS HC A05/MF A01

Provincetown-Boston Airlines Flight 1039, an Embraer Bandeirante, was cleared from the Jacksonville International Airport, Jacksonville, Florida, to Tampa, Florida at 1805 eastern standard time on December 6, 1985, in visual flight conditions. There were 11 passengers and 2 crewmembers aboard the scheduled domestic passenger flight operating under 14 CFR 135. At 1812, flight 1039 was cleared for takeoff, and, at 1813, while over the departure end of the runway and climbing, the crew acknowledged a frequency change. Thirty seconds later, about 1814, the airplane was seen in a steep descent near the extended centerline of the runway. Flight 1039 struck the ground 7,800 feet beyond the departure end of runway 31 and 85 feet to the northeast (right) of the extended runway centerline in an inverted nose down attitude, after which it caught fire and burned. The airplane was demolished, and all 13 persons aboard were killed. Before ground impact, the horizontal stabilizer, including bulkhead No. 36, had separated from the fuselage. Both elevators and elevator tips, the tail cone assembly, and the aft portion of the ventral fin also had separated in flight. Author

**AIRCRAFT TRANSPARENCY TESTING: ARTIFICIAL BIRDS Final Report, 1 Jul. 1984 - 1 May 1985**
C. J. WELSH and V. CENTONZE Apr. 1986 18 p Prepared in cooperation with AEDC
(AD-A166832; AEDC-TR-86-2) Avail: NTIS HC A02/MF A01 CSCL 14B

An analysis was made concerning the use of artificial birds in bird impact testing of aircraft transparencies. Results of this analysis, including impact measurements at a nominal velocity of 500 fps, indicated that the use of artificial birds for impact testing at these conditions is impractical. This follows from the importance and difficulty of simulating the shear strength characteristics of real birds in transparency impacts. GRA

**DEVELOPMENT OF AIRBORNE ELECTRIC FIELD AND LIGHTNING DETECTION INSTRUMENTATION FOR AVIATION SAFETY Final Report**
R. MARKSON 20 Apr. 1986 30 p
(Contract N00014-85-C-0707)
(AD-A167342) Avail: NTIS HC A03/MF A01 CSCL 01D

The objectives of Phase I were to investigate the use of simple corona current instrumentation on aircraft to measure thunderstorm electric fields and to conduct a feasibility study of a single station aircraft lightning interferometer to detect the occurrence and position of lightning. Both of these techniques have the common purpose of providing warning to aircraft crews when they are approaching potentially hazardous clouds and thunderstorms. The electric field measurement has the advantage of detecting electrified clouds which may not be producing lightning flashes but are nevertheless dangerous because an aircraft can trigger lightning; however this is a relatively short range system (on the order of 10 to 20 miles). The interferometer, which responds to RF pulses from lightning, has the advantage of long range detection (more than 100 miles) and can map the the position of lightning flashes in a manner similar to the way radar maps areas of rain. Thus the systems complement each other. GRA

Requirements, design and development, and feasibility aspects of Flight Data Recorders (FDR) and Cockpit Voice Recorders (CVR) are treated. Examples of existing systems (e.g., the U.S. Navy Universal Locator Airborne Data Systems, and the solid-state FDR) are given. Installation of FDR/CVR combined crash recorders in Westland Lynx helicopters is discussed. Aircraft accident relevant information, necessary adaptions of the helicopter, and feasibility were investigated. As the present aircraft indicating instruments often contain information after accidents it is concluded that installation of only a CVR is a feasible solution. However, future aircraft instruments (e.g., digital computers, and displays) might necessitate FDRs also.

**AVIATION WEATHER HAZARDS: FAA (FEDERAL AVIATION ADMINISTRATION) SYSTEM FOR DISSEMINATING SEVERE WEATHER WARNINGS TO PILOTS Briefing Report**

Apr. 1986 34 p
(PB86-195070; GAO/RCED-86-152BR; B-222882) Avail: NTIS HC A03/MF A01 CSCL 01B

Controllers at the nation's busiest airports sometimes do not have time to disseminate weather information to pilots. In addition, when weather information is given, it may not be given as soon as possible because controllers are too busy performing their primary duty of separating aircraft. FAA's procedure for communicating weather warnings by having controllers read them over their radio frequencies is too slow to avoid potential hazards, and some pilots may not receive any warning because of radio frequency changes. On-airport weather detection systems (LLWAS and ASR) do not provide controllers adequate detection or information about potentially hazardous weather because the radar cannot detect storm intensities, and the wind shear system cannot reliably detect the most dangerous form of wind shear, microbursts.

**INTERACTION BETWEEN EMP (ELECTROMAGNETIC PULSE), LIGHTNING AND STATIC ELECTRICITY WITH AIRCRAFT AND MISSILE AVIONICS SYSTEMS**

1986 144 p Presented at a Lecture Series, Ankara, Turkey, 29-30 May 1986, Oberpfaffenhofen, West Germany, 2-3 Jun. 1986, and The Hague, The Netherlands, 5-6 Jun. 1986; sponsored by Avionics Panel and the Consultant and Exchange Programme of AGARD
(AGARD-LS-144; ISBN92-835-1528-5) Avail: NTIS HC A07/MF A01

Interactions between transient electromagnetic waves with aircraft and missile avionics systems are described. Transient electromagnetic waves include electromagnetic pulses (EMP) from nuclear explosions, lightning, and static electricity. Interactions are introduced by coupling of EMP and lightning induced currents and voltages with avionics components. Shielding against these interactions is discussed with respect to induced currents and voltages from EMP and lightning, and induced voltages from static charging effects. Several examples of interactions, coupling, shielding, and measurement techniques are presented. This Lecture Series, sponsored by the Avionics Panel of AGARD, has been implemented by the Consultant and Exchange Program of AGARD.

**CRASHWORTHINESS OF AIRFRAMES**

1986 34 p Presented at the 61st Meeting of the Structures and Materials Panel of AGARD in Oberammergau, West Germany, 8-13 Sep. 1985
(AGARD-R-737; ISBN92-835-1525-0) Avail: NTIS HC A03/MF A01

At its 61st Meeting the AGARD Structures and Materials Panel heard three papers as a preliminary to setting up a Sub-Committee on this topic; this publication contains these papers. They survey a range of theoretical and experimental aspects of crashworthiness relating to metallic structures. For structures made of these materials theoretical methods are becoming useful design tools, but much further development is required before composite structures can be satisfactorily handled. There is a very great need for a data base of reliable experimental information (including accident data bases) on both metallic and composite structures.

**AN INERTIAL NAVIGATION SYSTEM WITH SINGLE-AXIS STABILIZATION**

S. REN and Z. LI (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 578-584. In Chinese, with abstract in English.

The principles, error model and simulation results of an inertial navigation system with single-axis stabilization are addressed. The error propagation characteristics are obtained by means of covariance analysis based on the developed error model. A series iteration technique is adopted for computation. An assumed trajectory of a short range missile is used for simulating the error covariance propagation. The principle of operation of the present system is simpler than that of a pure strapdown system, and lessens the requirements of the gyro dynamic range. As a result, it is possible to utilize a cheap gyro instead of an expensive one in the execution of the same navigation and guidance missions.

**APPLICATIONS OF SATELLITE COMMUNICATIONS TECHNOLOGIES TO INTERNATIONAL CIVIL AVIATION**

D. W. FREER (International Civil Aviation Organization, Air Navigation Bureau, Montreal, Canada) IN: SPACECOM '85; Space and Radiocommunications Symposium, 5th, Paris and Le Bourget, France, June 5-7, 1985, Speakers' Papers . Geneva, Switzerland, International Telecommunication Union, 1985, p. 75-82.

ICAO's considerations of satellite technologies for civil aviation from 1964-1985 are reviewed. The recommendations of the Application of Space Technology Relating to Aviation panel (1969) and the Aeronautical Satellite Service (1972) for the use of satellite-communication systems in aircraft are discussed. The development of a new international civil air infrastructure by the Future Air Navigation Systems (FANS) committee is examined. The disadvantages of satellite-communications and navigation systems, which include line-of-sight propagation constraints, limited flight routing flexibility, and the absence of air-ground data interchange capability, are studied. The infrastructure proposed by the FANS committee includes a satellite-based communications system with digital data and voice transmissions, nonsatellite ground-based communication capability in airport areas, global satellite navigation service, coverage from the earth surface to the 21,336 m range, and the integration of satellite-based communications, navigation, and serveillance systems. Policy issues affecting the implementation of the proposal are analyzed. I.F.

### A COMPUTER MODEL TO EVALUATE AIRBORNE RECEIVER PERFORMANCE IN INTERFERENCE ENVIRONMENTS

D. P. KOESTER, L. E. SMITH, R. R. STEVENS, JR., and C. E. COOK (MITRE Corp., Bedford, MA) IEEE Transactions on Communications (ISSN 0090-6778), vol. COM-34, May 1986, p. 462-474. refs
(Contract F19628-84-C-0001)

A computer model is described to evaluate airborne radio performance in a mixed environment of friendly and hostile emitters. A new performance criterion, the communications operability volume, is introduced. This criterion permits operational, scenario-based comparisons of various radio designs over a range of interference environments. Communications operability volumes can be calculated for different waveforms, receiver antenna patterns (including adaptive arrays), and detection thresholds. An empirical propagation algorithm is used to calculate path losses and/or maximum communications range. The computer model provides several types of graphic outputs that are used to compare antijam or electromagnetic compatibility performance for different radio designs at various locations relative to the sources of interference in a scenario. ### VLF RADIO NAVIGATION SYSTEMS [RADIONAVIGATSIONNYE SISTEMY SVERKHDLINNOVOLNOVOGO DIAPAZONA]

S. B. BOLOSHIN, G. A. SEMENOV, A. S. GUZMAN, G. V. GOLOVUSHKIN, and P. V. OLIANIUK Moscow, Izdatel'stvo Radio i Sviaz', 1985, 264 p. In Russian. refs

The book presents the fundamentals of the theory, operation, and implementation of VLF navigation systems commonly used for the long-range navigation of aircraft and ships. Topics discussed include the effect of propagation conditions on the operation of VLF navigation systems, methods of coordinate estimation under conditions on incomplete information on the correction model parameters, and system characteristic predictions. The discussion also covers methods of resolving the ambiguity of phase measurements, ground transmitting stations, and combining VLF navigation systems with other means of navigation. V.L.

### DME/P - A NECESSARY MLS COMPONENT FOR THE FUTURE

G. K. ROMREL (E-Systems, Inc., Montek Div., Salt Lake City, UT) ICAO Bulletin, vol. 41, March 1986, p. 18-21.

The design and capabilities of the precision distance measuring equipment (DME/P) of the microwave landing system (MLS) are analyzed. The DME/P is a landing aid used to guide an aircraft throughout the coverage volume of the MLS to a safe landing. The DME/P operates with a fast-rise-time pulse and coverage in the 2.4-6,100 m altitude range is provided by initial and final approach modes; the initial approach mode performs in the 13 km range and final approach mode operates from 13 km to landing. The detection accuracy possible due to the cos/cos-squared pulse-shaped signal and the Delay-Attenuation-Compare detection of the DME/P is discussed. The use of dynamic automatic delay correction circuits to eliminate potential false detection is examined. The transponder integrity design and the installation of the DME/P into aircraft are described. I.F.

**A86-46142**

### ILS GOAL - AUTOMATIC LANDINGS, SAFETY

P. LAUX (Thomson-CSF, Division Systemes Defense et Controle, Bagneux, France) ICAO Bulletin, vol. 41, March 1986, p. 27-29.

The design and functions of the instrument landing system (ILS) 381 T are described. The ILS allows for interaction between the pilot, aircraft, and the ground controller. The reliability and stability provided by the transmission chain of th IRS (VHF or UHF signal generator, amplifier and phase feedback loop of the signal, and a linear wideband amplifier) are analyzed. The use of a two-frequency array with 13-radiating elements, a 25-element, wide-aperture array, and a Thomson-CSF 'M' array to reduce the interference from reflecting objects is discussed. The monitor channels and transfer logic employed by the ILS 381 T are examined. The capabilities of the remote maintenance monitoring of the IRS 381 are considered. I.F.

### THE PROTECTED VOLUME OF AIRSPACE GENERATED BY AN AIRBORNE COLLISION AVOIDANCE SYSTEM

R. L. FORD (Royal Signals and Radar Establishment, Malvern, England) Journal of Navigation (ISSN 0020-3009), vol. 39, May 1986, p. 139-158. Research supported by the Civil Aviation Authority. refs

The features of the Traffic Alert and Collision Avoidance System (TCAS) II are described, and the operational principles of the system are explained. The shape, size, and orientation of the protected volume of the airspace are derived, showing how the threat detection logic used by TCAS II generates a volume of protected airspace enclosing own aircraft. It is also shown how the essential features of the protected volume may be used to calculate alarm rates for some simple traffic patterns. The TCAS III version, still under development, is intended to provide both horizontal and vertical escape maneuvers. I.S.

### TECHNOLOGY RESEARCH FOR STRAPDOWN INERTIAL EXPERIMENT AND DIGITAL FLIGHT CONTROL AND GUIDANCE Final Technical Report, 1 Oct. 1979 - 31 Dec. 1984

R. A. CARESTIA and D. E. COTTRELL 1985 113 p
(Contract NCC2-41)
(NASA-CR-176907; NAS 1.26:176907) Avail: NTIS HC A06/MF A01 CSCL 17G

A helicopter flight-test program to evaluate the performance of Honeywell's Tetrad - a strapdown, laser gyro, inertial navitation system is discussed. The results of 34 flights showed a mean final navigational velocity error of 5.06 knots, with a standard deviation of 3.84 knots; a corresponding mean final position error of 2.66 n.mi., with a standard deviation of 1.48 n.m.; and a modeled mean-position-error growth rate for the 34 tests of 1.96 knots, with a standard deviation of 1.09 knots. Tetrad's four-ring laser gyros provided reliable and accurate angular rate sensing during the test program and on sensor failures were detected during the evaluation. Criteria suitable for investigating cockpit systems in rotorcraft were developed. This criteria led to the development of two basic simulators. The first was a standard simulator which could be used to obtain baseline information for studying pilot workload and interactions. The second was an advanced simulator which integrated the RODAAS developed by Honeywell into this simulator. The second area also included surveying the aerospace industry to determine the level of use and impact of microcomputers and related components on avionics systems. M.G.

**ENGINEERING PERFORMANCE EVALUATION OF SMALL COMMUNITY AIRPORT MICROWAVE LANDING SYSTEM (TI-MODEL) AT PHILADELPHIA INTERNATIONAL AIRPORT RUNWAY 17 Final Report**
G. D. ADAMS and C. E. RICHARDSON Aug. 1986 68 p
(Contract DTFA01-82-Y-10521)
(FAA/PM-86/24) Avail: NTIS HC A04/MF A01

The Microwave Landing System (MLS) program is designed to meet both civil and military operational needs. It will eventually replace the Instrument Landing System (ILS). After a system/equipment development phase, the Federal Aviation Administration in 1979 began a Service Test And Evaluation Program (STEP) to obtain experience for developing criteria for siting, installation and preliminary operational procedures. Feasibility demo ground equipment from the development phase was used and user aircraft were equipped with MLS receivers. This report contains engineering evaluation of the FAA Technical Center flight test data taken on the Texas Instruments' manufactured Small Community MLS, as installed for STEP at Philadelphia International Airport Runway 17. The equipment performance was found to generally meet the FAA-STD-022b Path Following Error and Control Motion Noise requirement, but not the linearity requirement. Apparent aircraft propeller induced noise effects were identified. Author

**THE CONCEPT OF ALMOST-PARALLEL IFR (INSTRUMENT FLIGHT RULES) APPROACHES TO PARALLEL RUNWAYS**
A. C. SILVA Mar. 1986 52 p
(Contract DTFA01-84-C-00001)
(AD-A166485; MTR-86W11; FAA-DL5-86-1) Avail: NTIS HC A04/MF A01 CSCL 01B

Under today's rules independent parallel approaches are restricted to runways separated by at least 4300 feet. Currently the FAA is investigating a proposal to achieve reductions down to 3000 feet with the use of an improved surveillance system (1 milliradian accuracy/1 second update). This paper proposes new procedures to achieve such reduction, using existing radars, by executing almost-parallel MLS or ILS approaches. Almost-parallel approaches include curved paths where very shallow rates of turn are required and offset straight paths where the angle of offset with respect to the extended runway centerline is less than 3 degrees. Some issues of concern that arise, such as blunder resolution and pilot's loss of sight of other approach course during curved approaches, are discussed in this paper. Alternatives for an early implementation and site-specific sample applications are presented. The objective of this paper is to present in a concise manner this preliminary concept that has already generated some interest as a solution to reduced parallel operations. As with any new concept, analysis by all concerned parties have to be performed followed by simulations and/or demonstrations before the concept can be considered implementable. Author (GRA)

**WILL THE USAF NEED GROUND-BASED AIR TRAFFIC CONTROL RADAR IN THE YEAR 2000?**
G. L. VARN Apr. 1986 49 p
(AD-A166504; AD-E750871; ACSC-86-2585) Avail: NTIS HC A03/MF A01 CSCL 17G

Advanced technology in military aviation is developing rapidly. The Global Positioning System (GPS) and Microwave Landing System (MLS) will give the pilot precision navigation capability when fully deployed in the 1990s. The Joint Tactical Information Distribution System (JTIDS) will give the pilot the capability to display enemy and friendly aircraft in his area in his cockpit. At the same time, our mobile air traffic control (ATC) radars are aging and need to be replaced. But, with the new technology in the cockpit, it may be more feasible to eliminate ground-based ATC radar and let the pilot do his own ATC from the cockpit. This study examines the feasibility of a cockpit-based ATC system by looking at the requirement for military ATC, specific capabilities that new technologies give the pilot, and human considerations in a cockpit-based ATC system. The study concludes that a cockpit-based ATC system is not feasible and that there will be a need for ground-based ATC radar, at least through the year 2000. Author (GRA)

This is the final technical note for the Hardware Performance Analysis of the Basic Narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP) for the period January 1, 1981 through June 30, 1983. The MLS configuration, limits of signal operation, system and subsystem operation, data collection and analysis are described. Equipment and environmental problem areas uncovered during the test and evaluation are discussed in the Results section of this report. Chargeable failures are identified and listed and engineering investigations are discussed. Remote Maintenance Monitoring System (RMMS) data analysis are presented. Conclusions and recommendations are listed. GRA

**APPLICATION OF ROTOR INDUCED VELOCITY FIELD OF THE VORTEX THEORY TO THE STUDY OF STABILITY AND CONTROLLABILITY OF HELICOPTER WITH HINGELESS ROTOR**
Z. XIN (Air Force Research Institute, People's Republic of China) and S. WANG (Nanjing Aeronautical Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 521-529. In Chinese, with abstract in English. refs

With the aim of developing a new rotor system, a method is presented for calculation of stability and controllability of helicopter with a hingeless rotor. The effects of nonuniformity in rotor-induced velocity distribution and blade flapping elasticity are taken into account and investigated in detail. This is the first time that the first harmonic term of rotor-induced velocity distribution derived from the generalized vortex theory of rotor is employed, and a close form of equation for the induced velocity and circulation is established. Finally, analytic formulae suitable to engineering applications are given which consider the effects of the motion parameter, control parameter, blade flapping elasticity, and so on. Also, the effect of the second flapping mode on stability and controllability of helicopter with hingeless rotor is discussed. The calculations show that only the first flapping bending mode should be taken into account in stability and controllability calculation of helicopter with hingeless rotor in the range of mu less than 0.3. Finally, a typical Bo-105 helicopter is taken as a numerical example, and it is found that the results are in good agreement with its flight-test data. Author

### IMPROVEMENT OF SERVO SYSTEMS FOR FLIGHT SIMULATOR

D. SUN (China Precision Engineering Institute for Aircraft Industry, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 597-601. In Chinese, with abstract in English.

A great deal of experimental research was done on simulator servo systems during the development of the YMT-S1 type simulator. A modification of its design was accomplished by improving a 'double velocity' servo system, a velocity or position servo system with velocity differential feedback, and an 'integral control' servo system. The experiments have proved that these three types of servo system have tangible results in improving performances of the simulator. Their formation, working principles and results are presented. ### APPLICATION OF HARMONIC ANALYSIS METHOD TO RESEARCH ON ROTOR AIRLOADS

Z. QIU (Chinese Helicopter Research and Development Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, Feb. 1986, p. 11-18. In Chinese, with abstract in English.

Using the rotor vortex theory, the rotor airflow and the rotor induced velocity are developed into Fourier series. The flow distribution along the blade spanwise is expressed in terms of segment-by-segment linear functions and the induced velocity equations and the flow equations are derived. The engineering application of the rotor vortex theory is provided. Then the induced velocity and its harmonic components are obtained to provide a quantitative basis for the vortex model. To calculate each order harmonic components of the induced velocity a simplified method is forwarded which considers the effects of each order flow while neglecting those of a higher order. The method saves computer time and is of significant benefit. Author

### DURABILITY AND DAMAGE TOLERANCE IN AIRCRAFT DESIGN; PROCEEDINGS OF THE THIRTEENTH SYMPOSIUM, PISA, ITALY, MAY 22-24, 1985

A. SALVETTI, ED. and G. CAVALLINI, ED. (Pisa, Universita, Italy) Symposium sponsored by the International Committee on Aeronautical Fatigue; Organized by the Italian Association for Aeronautical Fatigue. Warley, England, Engineering Materials Advisory Services, Ltd., 1985, 684 p. For individual items see A86-43777 to A86-43798.

The conference presents papers on fatigue and damage tolerance work during the aircraft design process, fatigue life prediction in the crack initiation and crack propagation stages, the significance of flight-simulation fatigue tests, fatigue life under compression-dominated spectra, fatigue cracking of aluminum under spectrum loading at various humidities, increasing fatigue and crack growth lives of short-edge-margin holes and the evaluation of materials degradation due to cyclic loading in composites. Also considered are U.S. Army requirements for damage tolerance of composite helicopter structure, the damage tolerance test program of the Fokker 100, a continuing structural integrity program for transport aircraft, a maintenance system by means of the damage tolerance principle and a rationale for the safe operation of an aircraft fleet having known cracks in its primary structure. Papers are also presented on the residual strength characterization of jet transport structures, a simple crack closure model for predicting fatigue crack growth under flight simulation loading, the effect of residual stress fields at notches on fatigue crack growth and the certification of airframes and components in metals and components. K.K.

**A86-43777**

### FATIGUE AND DAMAGE TOLERANCE WORK DURING THE AIRCRAFT DESIGN PROCESS

L. JARFALL (SAAB-Scania AB, Linkoping, Sweden) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 1-31. refs

Stress office routine procedures for the handling of fatigue life and damage tolerance work during the design process are reviewed and discussed. Four main tasks are identified: Handling of spectra, Planning of tests, Fatigue life and Crack growth predictions. Examples of procedures and experiences are taken from an actual fighter aircraft project. Author

### THE SIGNIFICANCE OF FLIGHT-SIMULATION FATIGUE TESTS

J. SCHIJVE (Delft, Technische Hogeschool, Netherlands) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 71-170. refs

Results of flight-simulation fatigue tests drawn from many literature sources are analyzed to reveal the effects of truncating high loads, omitting low-amplitude cycles, the minimum stress of ground-air-ground cycles, design stress levels, sequence of flights and loads within a flight and material thickness. Tests with gust-dominated wing load spectra and maneuver-dominated wing load spectra are considered separately, which is also done for results on crack initiation life and on crack growth. Special attention is paid to standard load histories TWIST and FALSTAFF. Recommendations are given for the planning of flight-simulation tests, especially for full-scale tests. Attention is paid to comparative flight-simulation tests and the meaning of such tests for fatigue prediction problems. Author

### U.S. ARMY REQUIREMENTS FOR DAMAGE TOLERANCE OF COMPOSITE HELICOPTER STRUCTURE

J. P. WALLER and R. S. MCLELLON (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 297-316.

Preliminary U.S. Army damage tolerance design criteria are presented with a rationale for their development. A brief description of previous Army experience in the application of composites on military helicopters is included with a discussion of relevant technology and future applications. Author

**A86-43786**

### DAMAGE TOLERANCE TEST PROGRAM OF THE FOKKER 100

A. A. JONGEBREUR, E. P. LOUWAARD, and R. V. VAN DER VELDEN (Fokker, Schiphol, Netherlands) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 317-349. refs

The Fokker 100 is an advanced new twin turbofan aircraft with a redesigned super critical wing and increased utilization of composites. The objective with regard to damage tolerance is to satisfy the latest requirements. During the decision making process of how this is accomplished in terms of analysis and supporting tests, several special aspects were considered, e.g., the availability of test- and operational experience of the F28 'Fellowship', with which the Fokker 100 has much in common, and the time schedule of the Fokker 100 program. The test program as finally adopted, comprises full scale flight simulation testing for a large part of the aircraft. Author

**AIRBUS INDUSTRIE A310 AND A300-600 EXPERIENCE WITH PRACTICAL APPLICATIONS OF DAMAGE TOLERANCE DESIGN IN FUSELAGE PRIMARY STRUCTURE**

H.-J. SCHMIDT and C. L. HAMMOND (Messerschmitt-Boelkow-Blohm GmbH, Hamburg, West Germany) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 351-382. refs

A brief description of the current damage tolerance requirements for a civil aircraft primary structure is given as well as examples of application to the A310 and A300-600 fuselage structure. Comparisons between analysis and full-scale test results for selected points are presented along with resulting repercussions for future design and for the development of the required inspection programs. Finally, conclusions and recommendations are given for the future application of a damage tolerance design and for additional work required to better understand the damage tolerance behavior of complex structures. Author

**CONTINUED AIRWORTHINESS OF DAMAGE TOLERANT AIRCRAFT**

D. R. TURNER, R. BANISTER, and P. TO IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 383-393.

The CL-600 was the first aircraft to address the damage tolerance evaluation of FAR 25.571 amendment 45. Compliance was shown and FAA type approval was granted in February 1983. This paper discusses some of the certification activities which occurred after this time due to a reevaluation of the CL-600 by Transport Canada and also the introduction of the CL-601 version with a General Electric Engine. The impact on the maintenance and repair manuals is discussed. Author

**A86-43790**

**DAMAGE TOLERANCE AND DURABILITY IN THE DESIGN OF A SHORT-HAUL TURBOPROP AIRCRAFT**

A. GALASSO, A. DEL CORE (Aeritalia S.p.A., Gruppo Velivoli Trasporto, Pomigliano d'Arco, Italy), G. CAVALLINI, and A. LANCIOTTI (Pisa, Universita, Italy) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 423-472.

The fatigue design of the ATR 42 aircraft is presented from the point of view of its durability and damage tolerance. An account is given of the durability tests carried out on joint specimens and of the damage tolerance tests carried out on both standard specimens and stiffened panels. The various aspects of full-scale fatigue tests are described, and included in test objectives are the following: (1) the verification of the fatigue life objectives of the ATR 42 airframe, (2) the identification of fatigue critical areas by means of a test program that represents service loading conditions, and (3) the examination of crack propagation as well as inspection and repair methods in an effort to define inspection intervals and repair methods. It is noted that this test is presently running successfully and has reached 12,000 simulated flights. K.K.

**A86-43795**

**RESIDUAL STRENGTH CHARACTERIZATION OF JET TRANSPORT STRUCTURES**

U. G. GORANSON, C. K. GUNTHER, and W. T. HARDRATH (Boeing Commercial Airplane Co., Seattle, WA) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 585-603. refs

The principles of residual strength analysis procedures developed to account for local redistribution and component failures are outlined and their applicability to damaged jet transport structures is assessed. A model which predicts maximum load and stable crack growth for stiffened panels is described. It operates on the basis of compatibility of displacements at the fastener location, considers elastic-plastic behavior for the fasteners and stingers, takes any elemental failure into account and is capable of analyzing stable crack growth in the skin panel material. A residual strength analysis procedure which takes the transition between linear elastic fracture mechanics failure and net section yield into consideration is also developed. K.K.

**THE OPTIMIZATION OF SEAPLANES - NEW CHANCES AND REQUIREMENTS REGARDING FLYING BOATS [ZUR OPTIMIERUNG VON SEEFLUGZEUGEN - NEUE CHANCEN UND ANFORDERUNGEN AN FLUGBOOTE]**

RWTH-Themen, no. 2, 1986, p. 52-56. In German.

The present situation concerning a demand for seaplanes is considered. It is found that aircraft which are designed to take off from and land on water would be very useful for a number of countries. Thus, in countries consisting of many islands, such as the Philippines and Indonesia, such aircraft could provide a very convenient means of transportation for people, freight, and mail. Other countries which could profit from a use of such aircraft are those having suitable bodies of water in their interior, taking into account Canada, Brazil, Finland, and countries which can utilize lake and river systems in Africa. The aircraft considered could also be very useful for surveillance and rescue operations, and in operations against forest fires it would be easier to take up water by landing on a body of water. The requirements which the aircraft would have to satisfy to perform their prospective functions are discussed along with suitable aircraft design features. G.R.

**X-WING ROTOR SYSTEMS TEST VEHICLE SCHEDULED FOR FLIGHT IN OCTOBER**

S. W. KANDEBO Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 16, 1986, p. 52, 57.

The X-wing configured S-72 rotor systems research aircraft is scheduled to fly in October 1986 to test the X-wing's start/stop characteristics in the 180-200 kt range. This X-wing VTOL vehicle uses two forward- and two aft-swept wings to fly, but can rotate these in the manner of a helicopter rotor for hover. Rotor blade lift control is furnished by air ingested and expelled through leading and training edge slots. In fixed-wing flight, rotor airfoil pitch control is achieved through variable fore and aft air blowing and the use of a horizontal stabilizer. O.C.

**RAFALE WILL KEEP TRICOLOR FLYING**

P. LANGEREUX Aerospace America (ISSN 0740-722X), vol. 24, June 1986, p. 26-28, 30.

An evaluation is made of the design features and prospective performance levels of France's Rafale experimental fighter aircraft, with reference to the European Fighter Aircraft technolgy demonstration work that is being simultaneously undertaken by a consortium of European manufacturers. Rafale is envisioned in two variants, for attack and air defense; both versions will have 12 external hardpoints, evenly divided between the wings and fuselage. The configuration of Rafale is of the canard-delta type, with two engines and single seat cockpit. High lift devices are employed on both the leading and trailing edges of the wings, facilitating maneuvers at currently unachievable angles of attack. The Rafale's structural mass comprises 25 percent composites. O.C.

### NEW TECHNOLOGIES FOR A EUROPEAN FIGHTER

J. VINCENT (British Aerospace, PLC, Weybridge, England) Aerospace America (ISSN 0740-722X), vol. 24, June 1986, p. 34-36.

The state-of-the-art technologies that will be integrated into the European Experimental Aircraft Program (EAP) fighter aircraft are discussed, and their prospective performance levels are assessed. EAP's configuration is of the canard-delta type, and a full authority digital fly-by-wire system is employed to maximize this inherently unstable configuration's agility with minimum pilot workload. The large wing area employed is prompted by both high turn rate and low speed/short landing run requirements. Stealth technology features are incorporated to maintain low radar signature. Extensive use is made of carbon fiber-reinforced composite structures. O.C.

### FLIGHT TESTING OF THE NAVIGATION AND FLIGHT CONTROL COMPLEXES OF AIRCRAFT AND HELICOPTERS [LETNYE ISPYTANIIA PILOTAZHNO-NAVIGATSIONNYKH KOMPLEKSOV SAMOLETOV I VERTOLETOV]

E. G. KHARIN, ED. Moscow, Izdatel'stvo Mashinostroenie, 1985, 128 p. In Russian. No individual items are abstracted in this volume.

Methods for testing and evaluating the performance characteristics of the navigation and flight control complexes of flight vehicles are presented. In particular, attention is given to the theory and methods of evaluating the accuracy of navigation and flight control, assessing the performance of the algorithms of on-board navigation systems, and identifying models of errors characteristic of the navigation and flight control equipment. The discussion also covers methods of evaluating flight safety in relation to the reliability of the navigation and flight control systems. V.L.

### OPTIMAL TAKE-OFF TRAJECTORIES IN THE PRESENCE OF WINDSHEAR

A. MIELE, T. WANG (Rice University, Houston, TX), and W. W. MELVIN (Delta Air Lines, Atlanta, GA) Journal of Optimization Theory and Applications (ISSN 0022-3239), vol. 49, April 1986, p. 1-45. refs

(Contract NAG1-516)

The present consideration of takeoff trajectory optimization in eight different fundamental problems involving wind shears assumes that the power setting is held at the maximum value, and that the aircraft is controlled with respect to angle-of-attack. While the first three problems are least-squares ones of the Bolza type, the remaining five are minimax problems of the Chebyshev type which can be converted to Bolza type by means of suitable transformations. All problems are solved on the basis of the dual sequential gradient-restoration algorithm for optimal control problems. The trajectory solutions obtained are superior to constant angle-of-attack trajectories. O.C.

### OPTIMIZING THE NOTAR DESIGN

Aerospace Engineering (ISSN 0736-2536), vol. 6, June 1986, p. 52-57.

The operating principles and design history of NOTAR, a no-tail-rotor antitorque system for single-main-rotor helicopters, are reviewed and illustrated with drawings, diagrams, and photographs. The primary components of NOTAR include a vertical fin, a tail boom, and an engine-driven variable-pitch fan (at the rear of the fuselage), circulation-control slots, and a direct jet thruster at the rear of the tail boom. Consideration is given to preliminary design concepts; the use of computer models to improve the design; wind-tunnel, flow-visualization, water-tank-LDV, whirl-stand, and flight testing; and the development of a specialized advanced-design tail fan. T.K.

**A86-44776**

### THE BOEING CREW ESCAPE TECHNOLOGIES (CREST) PROGRAM

R. F. YURCZYK (Boeing Military Airplane Co., Seattle, WA) SAFE Journal, vol. 16, no. 2, Summer 1986, p. 6-12.

Boeing completed Phase I of the CREST program and was recently awarded a contract for the next phase, IIA. The first phase consisted of requirements analysis and subsystem trade studies concluding with a System Design Review. Work included establishment of a performance baseline; development of a system specification and preliminary development specifications for the hardware and software subsystems; initial system design; and cockpit integration. Phase IIA consists of subsystem preliminary design and detail test planning concluding with a Preliminary Design Review of each configuration item. This paper describes the Boeing approach to the requirements of the CREST program with an overview of the system initial design. Author

### TRANSONIC AEROELASTIC ANALYSIS OF THE B-1 WING

G. P. GURUSWAMY (Sterling Software/Informatics, Palo Alto, CA), P. M. GOORJIAN (NASA, Ames Research Center, Moffett Field, CA), H. IDE, and G. D. MILLER (Rockwell International Corp., Los Angeles, CA) Journal of Aircraft (ISSN 0021-8669), vol. 23, July 1986, p. 547-553. refs

(AIAA PAPER 85-0690)

The flow over the B-1 wing is studied computationally, including the aeroelastic response of the wing. Computed results are compared with results from wind tunnel and flight tests for both low- and high-sweep cases, at 25.0 and 67.5 deg, respectively, for selected transonic Mach numbers. The aerodynamic and aeroelastic computations are made by using the transonic unsteady code ATRAN3S. Steady aerodynamic computations compare well with wind tunnel results for the 25.0 deg sweep case and also for small angles of attack at 67.5 deg sweep case. The aeroelastic response results show that the wing is stable at the low-sweep angle for the calculation at the Mach number at which there is a shock wave. In the higher-sweep case, for the higher angle of attack at which oscillations were observed in the flight and wind tunnel tests, the calculations do not show any shock waves. Their absence lends support to the hypothesis that the observed oscillations are due to the presence of leading-edge separation vortices and not to shock wave motion, as was previously proposed. Author

### THE ROLE OF STRUCTURAL AND AERODYNAMIC DAMPING ON THE AEROELASTIC BEHAVIOR OF WINGS

I. LOTTATI (Technion - Israel Institute of Technology, Haifa) Journal of Aircraft (ISSN 0021-8669), vol. 23, July 1986, p. 606-608. refs

The significant influence of the unsteadiness of a wake on flutter speed is presently demonstrated for a high aspect ratio rectangular wing that is idealized in terms of a box beam. Attention is also given to the influence of structural damping on the flutter speed, as related to the aerodynamic damping modeled by the aerodynamic air forces that are incorporated in the analysis. Many useful conclusions are drawn from close examination of the concept of computing the critical velocity of the system by frequency coalescence. O.C.

**SOCIETY OF EXPERIMENTAL TEST PILOTS, SYMPOSIUM, 29TH, BEVERLY HILLS, CA, SEPTEMBER 25-28, 1985, PROCEEDINGS**
Lancaster, CA, Society of Experimental Test Pilots, 1985, 292 p. For individual items see A86-44937 to A86-44950.

The present conference on recent achievements in flight testing methodology considers F-14A engine air intake icing conditions, the XV-15 tilt-rotor aircraft flight test program history, naval aircraft weapons system integration experience in the U.S. Navy, flight test and early service performance of the B 737-300 airliner, a high technology training simulator for cost reduction, initial flight test results from the X-29 program, and data from the AV-8B's high angle-of-attack/spin test program. Also discussed are metrics for advanced fighter agility performance, F-14 departure/spin and air combat maneuvering evaluation using a NASA FCS, Tornado high speed terrain-following performance testing in mountainous terrain and bad weather, A320 airliner flight controls, flight tests of the Voyager unrefueled circumnavigation aircraft, the orbital salvage operations conducted by STS mission 51-A, and aerobatic testing of the BK-117 helicopter. O.C.

**A86-44937**
**F-14A INLET ICING**
G. FREEMAN and B. M. PICARD (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 3-23.

The problem of ice forming on F-14A engine inlet surfaces and on certain conditions being shed into the engine, with resulting FOD (foreign-object-damage) is examined. The F-14A Tomcat is more susceptible to inlet icing problems than any other operational Navy airplane. The problem ice forms in the number three ramp area and normally sheds out the bleed door on the top of the fuselage with little probability of FOD. If substantial ice exists, however, when the aircraft is arrested on landing, the ice can dislodge with severe FOD a serious possibility. The Navy has designated the F-14A icing a Category IA hazard, defined as having catastrophic potential with frequent occurrence. Wind-tunnel tests, validated by flight tests, indicated that ice on the back wall of ramp three had been shed from the leading edge of ramp three. The test aircraft and instrumentation are described along with an inlet airflow survey, icing tests, and maneuvering tests. A modified 'anti-ice' inlet was developed which will effectively reduce ice accumulation on the leading edge of ramp three and eliminate ice accumulation above ramp three, thus minimizing the potential for engine FOD. The new inlet has demonstrated stall free engine/inlet compatibility during flight maneuvering up to 35 Kft and 0.9 indicated Mach number and is satisfactory for the fighter mission. D.H.

**THE XV-15 TILT-ROTOR FLIGHT-TEST PROGRAM**
D. C. DUGAN (NASA, Ames Research Center, Moffett Field, CA) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 24-41. refs

The XV-15 Tilt-Rotor flight research program is described; it has resulted in the full-scale development of the Navy's MV-22A Osprey which will be the world's first operational tilt rotor aircraft. Proof-of-concept flight test objectives have been completed along with military service tests and demonstrations. NASA Ames and Bell Helicopter Textron are currently engaged in advanced flight research programs. The government flight test activity is dicussed. It includes hover tests both in ground effect (IGE) and out of ground effect (OGE) for performance, downwash and noise measurements, short-field takeoff and landing (STOL) evaluations, aeroelastic stability investigations, dynamic stability tests, and three-axis sidestick-controller development and evaluation. Advanced Technology Blades will be installed and evaluated under all flight conditions. D.H.

**BOEING 737-300 FLIGHT TEST AND THE FIRST NINE MONTHS SERVICE EXPERIENCE**
J. C. MCROBERTS (Boeing Commercial Airplane Co., Seattle, WA) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 51-66.

**A86-44941**
**NORTHROP'S SURROGATE TRAINER**
F. S. DOTEN (Northrop Corp., Electro-Mechanical Div., Anaheim, CA) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 67-92.

The Surrogate Trainer, developed specifically to ensure that the new Apache attack helicopter is fielded with fully trained crews, is described. The Apache helicopter itself was developed with a full complement of weapons to include the standard mini-guns and rockets but enhanced with a chaingun and laser-guided missiles. It has a target acquisition/designation system capable of day and night operations, allowing the crew to fly nap-of-the-earth (NOE) as freely by night as by day. The particular Apache subsystem described is called the Pilot Night Vision Sensor (PNVS); it provides the pilot with the capability of flying night NOE with infrared video as the sole external visual reference. The surrogate Trainer is the name given to the TH-1S helicopter after the PNVS is installed. Topics covered include: PNVS How it works; the integrated helmet and display sight system; symbology generation; subsystem integration; design implementation; aft cokpit; front cockpit; data entry and display panel; blackout curtains; videotape recorder; fault detection and location system; power; ammunition bay pallet; subsystems integration; and flight testing. D.H.

**A86-44942*** National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.
**X-29 INITIAL FLIGHT TEST RESULTS**
S. D. ISHMAEL (NASA, Flight Research Center, Edwards, CA) and T. WIERZBANOWSKI (USAF, Flight Test Center, Edwards AFB, CA) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 95-113.

It is announced that the X-29 forward-swept-wing (FSW) aircraft has been built, with flight testing under way and proceeding smoothly. The X-29 is a single-seat, single-engine supersonic aircraft that blends an optimized FSW, a close-coupled near-coplar canard, an F-5A forward fuselage module employing two side-mounted engine inlets, and a new aft fuselage. An F404-GE-400 engine with afterburner provides about 16,000 lb of thrust. The X-29 was designed to be near neutrally stable in the supersonic region to minimize drag; it becomes highly unstable transonically and subsonically, which dictates the use of a computerized fly-by-wire flight control system capable of stabilizing the aircraft. The X-29 advanced technology demonstrator began flight testing on Dec. 14, 1984; by Sept. 26, 1985, its envelope had been expanded to 0.75 Mach, 350 knots estimated airspeed, and 30,000 feet altitude. The aircraft has flown with very few problems and aerodynamic, structural, and control system results have correlated well with predictions. Areas where prediction and performance are not so well correlated are noted. D.H.

**A86-44943**

### AV-8B HIGH ANGLE OF ATTACK/SPIN PROGRAM

W. W. LOWE (McDonnell Aircraft Co., St. Louis, MO) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 114-133.

Program commitments and accomplishments are noted with regard to the AV-8B (Harrier II) high angle of attack test program. The program was originally structured to define boundaries of controllable flight, to explore departure dynamics and recovery, and to investigate spins if encountered. However, since earlier Harrier II testing had uncovered undesirable departure tendencies, an additional program commitment was made to correct this problem. Hardware changes made during the pre-program layup included: modifying the rudder actuator relief valve to give 15 percent more hinge moment to resist sideslip; reworking the aileron actuators to allow 6 degrees of servo authority (with new servo authority increased to 34 percent of total surface travel); adding an additional lateral accelerometer and roll rate gyro forward of the CG to provide feedback loop stability; and providing a lateral stick position sensor to implement a roll/yaw interconnect. Resistance to spin is extreme for the Harrier II. Even for lateral asymmetries to 7500 ft lb, aggravated with other than neutral controls to trigger a spin. If a spin is ever encountered, aerodynamic controls are powerful enough to effect recovery. Procedures are given for both inverted and upright spin recovery. D.H.

### TORNADO HIGH SPEED TERRAIN FOLLOWING TESTING IN MOUNTAINOUS TERRAIN AND BAD WEATHER

P. WEGER (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 180-195.

The development and flight testing of a terrain-following system for the West German jet fighter Tornado are described. After more than 200 developmental flights, it has been possible to achieve final clearance for flying the aircraft at the lowest clearance height at 600 knots in mountainous terrain under full instrumental meteorological conditions. Equipment, the test area in the Schwarzwald of southwest Germany, crewing, aircraft system considerations, the O-G problem, flight control system considerations, the EMI problem, flight envelope, flight director use, terrain-following-system changes, system set-up, the warning system, weather, Category II landing capability, and open loop pull-up training are among the topics covered. The dynamics of flight at 600 knots over rough terrain in the hard-ride mode in frontal weather areas was described as 'breathtaking'. Advice is given for the pilot making use of the terrain following system.

### FLIGHT TESTING THE VOYAGER - A NON-STOP, UNREFUELED, AROUND-THE-WORLD AIRCRAFT

R. G. RUTAN and J. L. YEAGER (Voyager Aircraft, Inc., Mojave, CA) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 226-235.

Attention is given to the design features, mission requirements, performance characteristics, and flight test program accomplishments of the 'Voyager' long distance aircraft, which has been designed to circumnavigate the globe without refueling. The flight test program is divided into two phases that are respectively dedicated to verify performance predictions and to refine stability and control systems. Attention is presently given to lateral stability and control, bank-recovery deficiency at low speed, autopilot and avionics performance criteria, and aeroelastic airframe behavior. Flight test results are also presented. O.C.

### AEROBATIC TESTING OF THE BK-117 HELICOPTER

G. A. SHARON and E. TAVARES (U.S. Army, Aviation Engineering Flight Activity, Edwards AFB, CA) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 262-283.

An evaluation is made of the results obtained in aerobatic flight tests of a BK-117 helicopter, with a view of such maneuvering capabilities' applicability to increasingly important helicopter air-to-air combat. Attention is given to the performance envelope of the BK-117 test helicopter, test conditions, and helicopter behavior in the standard aerobatic/combat maneuvers known as 'modified lazy-eight', 'hammerhead', roll, loop, 'one-half Cuban eight', 'reverse one-half Cuban eight', and 'pushover'. ### BRITISH EXPERIMENTAL AIRCRAFT PROGRAM PROVIDING INSIGHT INTO NEW TECHNOLOGY

D. A. BROWN Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 23, 1986, p. 71, 73, 76.

The British Experimental Aircraft Program (EAP) technology demonstrator aircraft program is discussed. This aircraft is not a prototype, but rather serves to provide in-flight technical evaluation of a number of different emerging technologies, all of which are combined in the design. Six performance objectives for the aircraft are summarized along with seven project objectives intended to demonstrate that the aircraft can meet its performance objectives. The system has four flight control computers rather than the six used on the Jaguar, and uses software different from that for the Jaguar because of the different flight characteristics of the EAP. The drives for the aircraft control surfaces and for the instruments are described, and the functioning of the control system is summarized.

### STRUCTUREBORNE NOISE INVESTIGATIONS OF A TWIN ENGINE AIRCRAFT

J. M. GARRELICK, J. E. COLE, III, and K. MARTINI (Cambridge Acoustical Associates, Inc., MA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs
(Contract NAS1-18020)
(AIAA PAPER 86-1905)

The interior noise of aircraft powered by advanced turbo-prop concepts is likely to have nonnegligible contributions from structureborne paths, these paths being those involving propeller loads transmitted to the structures of the lifting surfaces. As a means of examining these paths, structural measurements have been performed on a small twin-engine aircraft, and in addition analytical models of the structure have been developed. In this paper results from both portions of this study are presented.

### CABIN NOISE CHARACTERISTICS OF A SMALL PROPELLER POWERED AIRCRAFT

H. V. L. PATRICK (North Carolina State University, Raleigh) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p. refs
(AIAA PAPER 86-1906)

A transfer function between engine vibrations and cabin noise of a Cessna 172 'Skyhawk' airplane was obtained by shaking the static engine. During flight conditions, the same parameters were measured recorded, and analyzed. Cabin noise was predicted based upon the transfer function and compared with actual cabin noise measurements obtained at 5000 ft altitude and engine rotation speed of 2400 rpm. It was concluded that engine vibrations do not appreciably contribute to cabin noise via a structure borne path at 2,400 rpm. Other conclusions obtained were that the cabin noise is dominated by propeller rotation noise at the blade-passing frequency and that wind screen vibrations contribute significantly to cabin noise at 2,400 rpm. At an engine rotational speed of 2,100 rpm the cabin noise spectrum was noticeably different than at 2,400 RPM and there was strong evidence of structure-borne noise. Author

**EFFECTS OF AN INTERNAL FLOOR ON LOW FREQUENCY SOUND TRANSMISSION INTO AIRCRAFT CABINS - AN EXPERIMENTAL INVESTIGATION**

J. D. JONES and C. R. FULLER (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs
(Contract NAG1-390)
(AIAA PAPER 86-1939)

A simplified cylindrical model of an aircraft fuselage is used to experimentally study the effects of an internal floor on low frequency sound transmission into aircraft cabins. A scaled-down lattice floor support and floor skin are designed based upon selected characteristics of a business aircraft. Thus, the model provides a simplified procedure for studying the effects of various structural modifications as well as other important effects. Modal decomposition of the shell response and the corresponding pressure response at various interior locations are presented. Results indicate that the main effect of the floor on interior pressure levels is due to modification of the interior acoustic mode shape and not due to the structural modification of the fuselage caused by the lattice floor support. Author

**STRUCTURAL INFLUENCE OF CABIN FLOOR ON SOUND TRANSMISSION INTO PROPELLER AIRCRAFT - ANALYTICAL INVESTIGATIONS**

C. R. FULLER (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs
(Contract NAG1-390)
(AIAA PAPER 86-1940)

The structural influence of the cabin floor on the transmission of low frequency propeller noise into aircraft interiors has been examined using a simplified analytical model. The response amplitudes and distributions of shell displacement and internal acoustic pressure are examined for various frequencies and floor configurations. In general, at lower frequencies the floor exerts little structural influence on the transmission of acoustic energy to the interior. However, as the frequency nears half the cylinder ring frequency the floor can be seen to significantly alter the internal pressure distributions and response. Author

**ACTIVE CONTROL OF PROPELLER INDUCED NOISE FIELDS INSIDE A FLEXIBLE CYLINDER**

H. C. LESTER (NASA, Langley Research Center, Hampton, VA) and C. R. FULLER (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 18 p. refs
(AIAA PAPER 86-1957)

An active noise control model has been evaluated for reducing aircraft interior noise. The structural noise transmission properties of an aircraft fuselage were modelled as a flexible cylinder excited by external acoustic dipoles simulating the noise produced by twin propellers. The amplitudes of an internal distribution of monopole control sources were determined such that the area-weighted mean square acoustic pressure was minimized in the propeller plane. The noise control model was evaluated at low frequencies corresponding to the blade passage frequency and first few harmonics of a typical turbo-prop aircraft. Interior noise reductions of 20 25 dB were achieved, over a substantial region of the cylindrical cross-section, with just a few monopole control sources. The most favorable interior noise reductions were achieved when the active noise control model was used in combination with propeller source phasing. Author

**AN EXPERIMENTAL INVESTIGATION OF REDUCING ADVANCED TURBOPROP CABIN NOISE BY WING SHIELDING**

J. H. DITTMAR (NASA, Lewis Research Center, Cleveland, OH) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 18 p. Previously announced in STAR as N86-25218. refs
(AIAA PAPER 86-1966)

An experimental investigation was undertaken to determine if wing shielding could reduce the noise impacting the fuselage of an advanced turboprop airplane. Four wings were tested behind two eight-bladed propeller models. Significant shielding of the propeller noise was observed and a particular wing-propeller geometry was identified to provide the most shielding. Specifically, an up-inboard rotation would be needed for a low-wing airplane and a down-inboard rotation for a high-wing airplane. As the axial Mach number was increased, the position where the shielding starts moved farther downstream. This shift in the start of shielding was roughly a straight line with respect to Mach number between M = 0.7 and M = 0.8. At M = 0.85 the start of shielding does not shift any farther downstream. A simple barrier noise-reduction model gave the same trends with transducer positions as did the data, and, if corrected for Mach number shift, the model might be used to provide estimates of the wing shielding. Besides providing a barrier to the noise reaching the shielded area, the wing also reflects some of the noise back onto the unshielded area. This can make the noise difference between the unshielded and shielded areas of the fuselage larger than would be expected by simple wind shielding. Author

**WING LOADS INDUCED BY A PROPELLER WAKE**

D. S. WEIR (Kentron International, Inc., Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p.
(Contract NAS1-18000)
(AIAA PAPER 86-1967)

A wing located in the wake of a propeller sustains unsteady loading. This loading can generate components of structureborne noise which are transmitted to the interior of the aircraft. The vibration of the wing can also contribute to reradiation of propeller noise. An analysis system for the evaluation of wing unsteady loads is presented. The propeller wake is modeled as a potential helical tip vortex and unsteady airfoil theory is used to determine the wing response. The result is the forcing function for determining the structureborne noise. The wing response is evaluated as a function of propeller thrust coefficient, advance ratio, and propeller installation geometry. The system capabilities are demonstrated by application to three significantly different aircraft. Author

**A COMPARISON OF THE STRUCTUREBORNE AND AIRBORNE PATHS FOR PROPFAN INTERIOR NOISE**

W. EVERSMAN, J. V. RAMAKRISHNAN, and L. R. KOVAL (Missouri-Rolla, University, Rolla) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 13 p. refs
(Contract NAG1-394)
(AIAA PAPER 86-1863)

In the present comparative study of aircraft interior noise levels due to airborne and structureborne paths for a given propeller source, a structure model is used that treats the fuselage interior as a rectangular cavity with five rigid walls; the sixth, or fuselage sidewall, is a stiffened panel. The wing is modeled as a simple beam carried into the fuselage by a large, discrete stiffener representing the carry-through structure. Comparisons are made on the basis of interior noise over a range of propeller rotational frequencies at a fixed thrust. It is found that the relative importance

of the structural and airborne paths is highly dependent on the structural parameters.

### GROUND RESONANCE OF A HELICOPTER DURING THE TAKE-OFF AND LANDING RUN [REZONANS PRZYZIEMNY SMIGLOWCA PODCZAS ROZBIEGU]

L. ZEREK and D. DYMITRUK Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 102, 1985, p. 39-62. In Polish. refs

Fundamental problems of the analysis of the ground resonance of a helicopter during the takeoff and landing run are discussed, some physical and mathematical models of the phenomenon being put forward. The influence of the speed during the takeoff and landing run of a helicopter on its natural vibrations and the ground resonance is analyzed. The results of the analysis are presented in a graphical form.

### STATISTICAL ANALYSIS OF THE INFLUENCE OF SERVICE PARAMETERS ON THE AEROACOUSTIC EFFECTS [STATYSTYCZNA ANALIZA WPLYWU PARAMETROW EKSPLOATACYJNYCH NA EFEKTY AEROAKUSTYCZNE]

A. CHYLA Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 102, 1985, p. 63-90. In Polish. refs

The service parameters of light airscrew-propelled aircraft and helicopters constitute sets of multidimensional control vectors of complex dynamic objects. The present paper contains numerical data obtained for 19 types of helicopters and 265 types of airscrew-propelled aircraft which are used in various countries. The two sets of measurement results (noise levels) are treated as independent samples constituting parts of two populations. From those data it is inferred that there is an empirical dependence of the acoustic pressure, in the far acoustic field, on the service and design parameters. The models used have been verified by statistical methods, which make it possible to create an experimental model describing the noise produced irrespective of the type of the predominant source of noise, the influence of interference effects, the nonhomogeneity of flow and dynamic characteristics and the influence of the variation of velocity. Making use of the mathematical model it is possible to introduce some design modifications to reduce the noise.

### CORPORATE FLYING, ITALIAN STYLE

A. POSTLETHWAITE Flight International (ISSN 0015-3710), vol. 129, June 21, 1986, p. 42-45, 48, 49.

The P.180 Avanti 6-9 seat business aircraft, which uses a unique three-surface (canard-incorporating) configuration and highly contoured fuselage together with twin pusher turboprops for aerodynamic efficiency, is able to cruise at 400 kt, while burning half the fuel load of a comparable-payload jet. In addition, it will at $3.1 million cost only half as much as a jet aircraft. An exceptional effort has been made to insure laminar boundary flow over the greatest possible portions of the fuselage and wing. The structure is almost entirely metallic, with composites being confined to the control surfaces. Attention is presently given to the rationale for numerous design details, and their prospective performance advantages.
O.C.

**A86-45758**

### MORE THAN A MIRAGE

G. WARWICK Flight International (ISSN 0015-3710), vol. 129, June 28, 1986, p. 41-44.

The development status, design features, and performance capabilities of the next-generation French fighter, Rafale, are assessed. Rafale owes its distinctive appearance to a unique semiventral engine air intake design that has been optimized to allow the forward fuselage to deflect airflow into the inlets at the high-angle-of-attack regime typical of transonic combat maneuvering. Approximately 25 percent of the Rafale's structural weight is made up of composite materials, which are primarily carbon fiber-reinforced. Extensive comparisons are presently made with the Mirage 2000, to give perspective on the performance improvements that the Rafale promises. Twelve stores stations are evenly divided between wings and fuselage; two 30-mm cannon are carried internally. The Snecma M88 engine, whose thrust/weight of 9.5-10 compares with 7.5 for the F404 turbofan, will power propulsion versions of Rafale.
O.C.

### SOVIET ATTACK HELICOPTERS

J. W. R. TAYLOR Air International (ISSN 0306-5634), vol. 31, July 1986, p. 14-20.

The development status and future development prospects of Soviet attack helicopters are evaluated, with emphasis on the design features and performance capabilities of the Mil Mi-24 'Hind' variants currently in service with Warsaw Pact and Third World forces. More than 2300 Mi-24 helicopters are believed to have been delivered for service to date. Chemical weapons are regarded to be standard options for the latest variant, the Hind-D, which entered service in 1981. Attention is given to the variety and effectiveness of Mi-24 weapons, as well as to the results of preliminary assessments of the state-of-the-art Mi-28 'Havoc' dedicated attack helicopter and Kamov Ka-32 'Hokum' air-to-air combat helicopter.

**A86-46125**

### A COME-BACK IN CANARDS

R. BRAYBROOK Air International (ISSN 0306-5634), vol. 30, June 1986, p. 267-276, 304-307.

A comprehensive discussion is presented concerning the design features and performance capabilities of state-of-the-art fighter aircraft employing canard configurations. The class encompasses both single and two-engined aircraft, and includes the Swedish JAS 39 Grippen, the French Rafale-A, the Israeli Lavi, the British EAP, and the inter-European EFA that is to be based on the EAP. The design trend is noted to have been instigated by the excellent performance established for the canard configuration by the Kfir derivative of the Mirage used by the Israeli Air Force and by the Swedish Viggen. All the aircraft in question are of multimission type, capable of both low altitude ground support/interdiction missions and air superiority/interception missions at high altitudes; all are, in addition, capable of supersonic speeds.
O.C.

**A86-46134**

### THE SKYEYE RPV - AN NDI SOLUTION TO TODAY'S UNMANNED AERIAL VEHICLE REQUIREMENTS

K. A. STANSELL (Lear Siegler, Inc., Developmental Sciences Astronics Div., Ontario, CA) Unmanned Systems, vol. 4, Spring 1986, p. 10, 11, 30.

Due to the sophistication of potential threat forces together with demands for reductions in defense spending, there is a renewed interest in the capabilities offered by unmanned aerial vehicle (UAV) systems. The development histories of the various members of the SKYEYE family are traced and their respective features are described. The SKYEYE R4E-40, the newest member of this family of unmanned aerial vehicles, offers a payload capacity of 140 pounds and a flight endurance exceeding eight hours. In late 1985, the SKYEYE was reconfigured to accommodate either a turreted daylight video or a turreted common module FLIR. It is noted that SKYEYE's success can be attributed to a great extent to its simplistic design and high degree of flexibility, both of which are reflected in the system's unique method of recovery. SKYEYE utilizes a shock-mounted centerline skid which requires no additional recovery equipment; it is also recoverable via a parachute system. The SKYEYE ground Control Station provides for command and control of the air vehicle and its payloads and accurate vehicle tracking and target positioning data.

### THE METHODS IMPLEMENTED AT ONERA TO IMPROVE AIRPLANE GROUND VIBRATION TESTS

R. DAT and P. LUBRINA (Union College, International Modal Analysis Conference, 4th, Los Angeles, CA, Feb. 3-6, 1986) ONERA, TP, no. 1986-8, 1986, 7 p. refs
(ONERA, TP NO. 1986-8)

Test and data-analysis tecnniques developed to improve the efficiency and accuracy of aircraft ground vibration tests using the ONERA mobile test laboratory are described. The principles of the iterative algorithm of Dat and Dunoyer (1981) and Dat (1983) for the separation of modal transfer functions (SMTF), permitting vibration testing with white-noise excitation or only roughly tailored harmonic excitation, are explained, and a simplified version is applied to sample data for a Mystere 20 aircraft. The identification of weak nonlinearities by curve-fitting algorithms or by application of SMTF at different excitation levels is demonstrated, and it is shown that strong nonlinearities can be identified by vibration tests with the control surfaces disengaged, by superimposing high-frequency vibration, or by analysis of the response of the wing-driven control surface. T.K.

**A86-46177#**

### NEW MODAL IDENTIFICATION METHODS APPLIED TO AERONAUTICAL STRUCTURES

G. PIAZZOLI (ONERA, Chatillon-sous-Bagneux, France) and C. HUTIN (Societe pour le Perfectionnement des Materiels et Equipements Aerospatiaux, Velizy-Villacoublay, France) (NATO, AGARD, Specialists Meeting, Oslo, Norway, Apr. 13-18, 1986) ONERA, TP, no. 1986-35, 1986, 23 p. refs
(ONERA, TP NO. 1986-35)

Two ground vibration tests which are based on transfer functions analysis methods and nonappropriated excitation are presented. The first, the 'Separation of Modal Transfer Function' is based on multiexcitations which are monitored by independent coherent processes. The second, the 'multi-Excitation Method' is based on excitations monitored by noncoherent random processes. The results of tests performed on the Falcon aircraft are compared with those of the classical method and a critical analysis is made; problems such as the nonlinearities of aircraft structures are taken into consideration. K.K.

**A86-46198#**

### AERODYNAMIC TECHNOLOGIES FOR GENERAL AVIATION AIRCRAFT

W. SCHMIDT Dornier Post (English Edition) (ISSN 0012-5563), no. 2, 1986, p. 18-20.

The development of the Dornier 228 aircraft is used to illustrate techniques which can ensure that new general aircraft satisfy performance and production cost goals for such aircraft. The important performance characteristics of such aircraft are range, single engine climb rate and minimum speed. The design goals are thus maximized L/D, cruise efficiency, climb parameter and high propeller efficiency. Computational fluid dynamics studies permit identification of fuselage designs that, in the case of the 228, offered a 15 percent decrease in drag from a previous generation of aircraft. The use of fiber-reinforced composites in the wings permits maintenance of laminar flow up to 60 percent of the chord. Variable camber was identified as a means to extend the shape control capability. Efficiency, i.e., fuel savings, was also realized with low drag propulsion integration, and it is expected that advanced propellers and propfans will provide even greater efficiency enhancements. M.S.K.

### AVANTI TO FLY SOON

M. GRANGIER Interavia (ISSN 0020-5168), vol. 16, June 1986, p. 645-647.

An assessment is made of the development status and marketing prospects of the 'Avanti' two-crew/six to nine-passenger twin-turboprop aircraft. The Avanti features an aerodynamically contoured fuselage and canard configuration, whose aerodynamic efficiencies yield a 1000-nmi range at 400-kt maximum cruising speed with six onboard. Cabin dimension and performance comparisons are tabulated for the Avanti and its competitors, the Starship I, Citation S/II, Cheyenne 400LS, and King Air 300. Projections are presented for the Avanti's cruising speed vs. altitude and IFR range/payload ratio performance. O.C.

### DYNAMIC AND FLUTTER ANALYSIS USING F.E.M. OF THE GP-180

A. MAZZONI and M. PIZZAMIGLIO (Rinaldo Piaggio Industrie Aeronautiche e Meccaniche S.p.A., Finale Ligure, Italy) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 2 . Schenectady, NY, Union College, 1985, p. 1162-1170.

Three steps have been followed for the GP-180 dynamic and flutter analyses. After a preliminary investigation of the GP-180 characteristics, using a simple beam finite element model, a detailed

analysis has been performed using the static model. The last verification of the results was done in the wind tunnel, using an aeroelastic model. This was based on a simple beam model, having the same characteristic about stiffnesses, mass, inertia, and in particular about mode shapes and flutter behavior of the detailed model.

**OPTIMAL LANDING OF A HELICOPTER IN AUTOROTATION**
A. Y. N. LEE Jul. 1985 322 p
(Contract NCC2-106)
(NASA-CR-177082; NAS 1.26:177082) Avail: NTIS HC A14/MF A01 CSCL 01C

Gliding descent in autorotation is a maneuver used by helicopter pilots in case of engine failure. The landing of a helicopter in autorotation is formulated as a nonlinear optimal control problem. The OH-58A helicopter was used. Helicopter vertical and horizontal velocities, vertical and horizontal displacement, and the rotor angle speed were modeled. An empirical approximation for the induced velocty in the vortex-ring state were provided. The cost function of the optimal control problem is a weighted sum of the squared horizontal and vertical components of the helicopter velocity at touchdown. Optimal trajectories are calculated for entry conditions well within the horizontal-vertical restriction curve, with the helicopter initially in hover or forwared flight. The resultant two-point boundary value problem with path equality constraints was successfully solved using the Sequential Gradient Restoration Technique.

A perturbation/numerical methodology to analyze the flap-lead/lag motion of a centrally hinged spring restrained rotor blade that is valid for both hover and for forward flight was developed. The derivation of the nonlinear differential equations of motion and the analysis of the stability of the steady state response of the blade were conducted entirely in a Symbolics 3670 Machine using MACSYMA to perform all the lengthy symbolic manipulations. It also includes generation of the fortran codes and plots of the results. The Floquet theory was also applied to the differential equations of motion in order to compare results with those obtained from the perturbation analysis. The results obtained from the perturbation methodology and from Floquet theory were found to be very close to each other, which demonstrates the usefulness of the perturbation methodology. Another problem under study consisted in the analysis of the influence of higher order terms in the response and stability of a flexible rotor blade in forward flight using Computerized Symbolic Manipulation and a perturbation technique to bypass the Floquet theory. The derivation of the partial differential equations of motion is presented.

The Army's light scout-attack helicopters (LHXs), planned for deployment in the 1990's, will fly nap-of-the-earth (NOE) missions in high threat environments, often under poor visibility and adverse atmospheric conditions, and probably with a one man crew. A procedure for the analysis of pilot workload that will identify and explicate the main characteristics of those LHX mission components holding overload potential is described. A principled, in-depth, explication of the cognitive demans of LHX piloting is essential to any effective effort to address the human factors issues. A task-analytic procedure that will yield the detail and organizstion needed to achieve these goals is examined.

The modification and testing of a small electromechanical vibrator are described. The vibrator was designed for the flutter testing of aircraft wings and was built to specifications that make it compatible with the X-29 experimental aircraft. The device uses alternating electromagnetic forces to move a magnetic mass and produce vibration. Its unconventional way of producing vibration avoids the need for complex mechanisms and makes efficient use of space and weight.

The wing on the NASA F-111 transonic aircraft technology airplane was modified to provide flexible leading and trailing edge flaps. This wing is known as the mission adaptive wing (MAW) because aerodynamic efficiency can be maintained at all speeds. Unlike a conventional wing, the MAW has no spoilers, external flap hinges, or fairings to break the smooth contour. The leading edge flaps and three-segment trailing edge flaps are controlled by a redundant fly-by-wire control system that features a dual digital primary system architecture providing roll and symmetric commands to the MAW control surfaces. A segregated analog backup system is provided in the event of a primary system failure. This paper discusses the design, development, testing, qualification, and flight test experience of the MAW primary and backup flight control systems.

**FLIGHT TEST OF A DECOUPLER PYLON FOR WING/STORE FLUTTER SUPPRESSION**
F. W. CAZIER, JR. and M. W. KEHOE (National Aeronautics and Space Administration. Dryden (Hugh L.) Flight Research Center, Edwards, Calif.) Jul. 1986 14 p Presented at the AIAA 3rd Flight Testing Conference, Las Vegas, Nev., 2-4 Apr. 1986
(NASA-TM-87767; NAS 1.15:87767) Avail: NTIS HC A02/MF A01 CSCL 01B

The decoupler pylon is a NASA concept of passive wing-store flutter suppression achieved by providing a low store-pylon pitch frequency. Flight tests were performed on an F-16 aircraft carrying on each wing an AIM-9J wingtip missile, a GBU-8 bomb near midspan, and an external fuel tank. Baseline flights with the GBU-8 mounted on a standard pylon established that this configuration is characterized by an antisymmetric limited amplitude flutter oscillation within the operational envelope. The airplane was then flown with the GBU-8 mounted on the decoupler pylon. The decoupler pylon successfully suppressed wing-store flutter throughout the flight envelope. A 37-percent increase in flutter velocity over the standard pylon was demonstrated. Maneuvers with load factors to 4g were performed. Although the static store displacements during maneuvers were not sufficiently large to be of concern, a store pitch alignment system was tested and performed successfully. One GBU-8 was ejected demonstrating that weapon separation from the decoupler pylon is normal. Experience with the present decoupler pylon design indicated that friction in the pivoting mechanism could affect its proper functioning as a flutter suppressor. Author

(NASA-TM-89011; NAS 1.15:89011) Avail: NTIS HC A04/MF A01 CSCL 01C

Considerable progress has been made in the development of perforated suction surface material for laminar flow control applications. Electron-beam perforated titaniuum skin was used as the suction surface. Critical issues related to suction panel manufacturing were identified and largely resolved. The final product included fabrication of a 7-foot chord by 7-foot span perforated laminar flow control wind tunnel model. Techniques used can be adapted to modern aircraft production lines. The report includes details on panel instrumentation and other features required for testing in a transonic pressure tunnel. Author

**THE APPLICATION OF PRACTICAL OPTIMIZATION TECHNIQUES IN THE PRELIMINARY STRUCTURAL DESIGN OF A FORWARD-SWEPT WING**
E. LERNER *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 381-392 1985
Avail: NTIS HC A99/MF E03

The application of optimization technology in design studies that preceded the full development of the Grumman X-29, forward swept wing, demonstrator aircraft is outlined. Finite-element resizing methods were developed to satisfy optimality criteria for strength and divergence-velocity constraints. Application of the methods in an initial feasibility study of a variable sweep wing and in a more detailed, fixed wing design study are described. The usefulness of the methodology at various stages of design in demonstrated by tracing the process that led to the selection of an efficient cover-laminate configuration. ESA

Avail: NTIS HC A99/MF E03

Use of the gradient method to optimize carbon fiber reinforced composite airframe design is described. The optimization process consists of two major parts. The first part of the calculation is done to select the fiber orientations for a given structure under a given load. In the second part this preoptimized configuration is improved by varying the thicknesses of the layers, leading to the optimum design. This design having preoptimized compounds is compared with a corresponding quasiisotropic structure and a design having four fixed fiber directions but different thicknesses of the layers. The preoptimized design is shown to be best adapted to the load bearing requirements of the structure. ESA

L. LIBRESCU and L. BEINER *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 441-450 1985
Avail: NTIS HC A99/MF E03

Weight minimization of flat and curved panels exposed to a supersonic flow and subjected to a flutter speed constraint is described. The analysis encompasses axisymmetric circular cylindrical shells and rectangular orthotropic flat panels. Optimal control in a single variable and of distributed parameter systems is used in deriving the optimality equations. in order to ensure that the flutter speed of the optimal panel coincides with the constrained one, a flutter instability condition is employed. Galerkin's technique is used for solving the optimality equations and the influence of orthotropicity ratio, in-plane loads, aspect ratio, and boundary conditions on the optimal thickness distribution is determined. For the case of pure transverse shear panels, an aeroelastic paradox similar to the membrane paradox is revealed. The cases of 1-D type panels and isotropic 2-D panels are also considered. ESA

**AEROELASTIC PROBLEMS AND STRUCTURAL DESIGN OF A TAILLESS CARBON FIBER COMPOSITE (CFC) SAILPLANE**
J. SCHWEIGER, O. SENSBURG, and H. J. BERNS (Technische Univ., Brunswick, West Germany) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 457-468 1985
Avail: NTIS HC A99/MF E03

Severe instability at low speed in a 1/3 scale model of a 15 m sailplane was studied. Flutter calculations using data from a ground resonance test show that coupling of the rigid body short period mode with the first elastic mode causes the phemomenon. The wing was redesigned with the optimization programs FASTOP and TSO to find optimum fiber orientations and stiffness distributions for aeroelastic and strength requirements. By applying these computer codes the flutter speed is increased to an acceptable level with small modifications of the wing root geometry, a new design of the main spar, and by using a high modulus fiber type. With a small weight penalty compared to the initial design the flutter speed can be doubled. ESA

**STRUCTURAL DYNAMIC ASPECTS OF ROTOR NODAL ISOLATION**
J. STOPPEL *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 486-494 1985
Avail: NTIS HC A99/MF E03

An Antiresonance Isolation System (ARIS) for helicopters is described. In the passive nodal isolation system, the antiresonant frequency is tuned to the main rotor passage frequency to prevent the transmission of the oscillatory hub forces and moments to the fuselage. Analysis demonstrates that the nodal rotor isolation system may be strongly influenced by the structural dynamics of the helicopter. Due to the numerous eingenvalues the antiresonant frequency of the isolation system may be compensated by an adjacent natural frequency. In this case the desired isolating effect disappears. The complexity of the three dimensional structure aggravates the understanding and prediction of vibration system. For the BK 117 helicopter with MBB-ARIS, the structural optimization is demonstrated using finite element methods. ESA

**DETERMINATION OF NATURAL VIBRATION PROPERTIES OF A WING WITH WINGLET BY EXPERIMENTAL MODE SYNTHESIS TECHNIQUE**

S. N. GU, W. J. YOU, and J. S. JIANG *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 605-611 1985

Avail: NTIS HC A99/MF E03

Nine lowest natural frequencies and their corresponding natural modes of a wing model with winglet were determined using electric measurement and laser time-averaged holographic interferometry supplemented by sand contours. Three-dimensional quantitative analysis and orthogonalization of the three lowest natural modes of wing with winglet are carried out. Modal synthesis is used to get lower ordered natural frequencies and modes of the wing model with winglet, by using the six lowest orthogonalized modes of the wing and three lowest orthogonalized modes of the winglet. Calculated results of natural frequencies and modes of the wing with winglet and its wing by finite element method agree quite well with experimental data. ESA

**RAPID VIBRATION MODE ANALYSIS OF AIRCRAFT WITH EXTERNAL STORES**

M. KARPEL *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 612-616 1985

Avail: NTIS HC A99/MF E03

A method for coupling the vibration modes of a central structure to additional substructures is presented. A set of low frequency natural modes, including rigid body modes, represents the central structure. These modes are obtained by a mathematical model loaded with a set of fictitious masses at the connection to the substructures degrees of freedom. The substructures are represented by their mass properties, vibration modes with clamped boundary conditions and free-free rigid body modes. The connection of each substructure to the central structure is statically determinate. The method is applied for vibration analysis of aircraft with external stores. The coupled aircraft + stores dynamic properties may be efficiently used for flutter analysis. Comparison with vibration modes obtained by a direct (full-size) eigensolution shows very accurate coupling results with low order eigensolutions. ESA

Artificial intelligence (AI) based software and hardware concepts are applied to the handling system malfunctions during flight tests. A representation of malfunction procedure logic using Boolean normal forms are presented. The representation facilitates the automation of malfunction procedures and provides easy testing for the embedded rules. It also forms a potential basis for a parallel implementation in logic hardware. The extraction of logic control rules, from dynamic simulation and their adaptive revision after partial failure are examined. It uses a simplified 2-dimensional aircraft model with a controller that adaptively extracts control rules for directional thrust that satisfies a navigational goal without exceeding pre-established position and velocity limits. Failure recovery (rule adjusting) is examined after partial actuator failure. While this experiment was performed with primitive aircraft and mission models, it illustrates an important paradigm and provided complexity extrapolations for the proposed extraction of expertise from simulation, as discussed. The use of relaxation and inexact reasoning in expert systems was also investigated. Author

(NASA-TP-2589; L-16125; NAS 1.60:2589) Avail: NTIS HC A05/MF A01 CSCL 01B

On December 1, 1984, the FAA and NASA conducted a remotely piloted air-to-ground crash test of a Boeing 720 transport aircraft instrumented to measure crash loads of the structure and the anthropomorphic dummy passengers. Over 330 time histories of accelerations and loads collected during the Full-Scale Transport Controlled Impact Demonstration (CID) for the 1-sec period after initial impact are presented. Although a symmetric 1 deg. nose-up attitude with a 17 ft/sec sink rate was planned, the plane was yawed and rolled 13 deg. at initial (left-wing) impact. The first fuselage impact occurred near the nose wheel well with the nose pitched down 2.5 deg. Peak normal (vertical) floor accelerations were highest in the cockpit and forward cabin near the nose wheel well and were approximately 14G. The remaining cabin floor received normal acceleration peaks of 7G or less. The peak longitudinal floor accelerations showed a similar distribution, with the highest (7G) in the cockpit and forward cabin, decreasing to 4G or less toward the rear. Peak transverse floor accelerations ranged from about 5G in the cockpit to 1G in the aft fuselage. Author

**THE PERFORMANCE EVALUATION OF A JET FLAP ON AN ADVANCED SUPERSONIC HARRIER Final Report**

L. D. LIPERA and D. R. SANDLIN Aug. 1984 84 p

(Contract NCC2-238)

(NASA-CR-179653; NAS 1.26:179653) Avail: NTIS HC A05/MF A01 CSCL 01C

The performance concept of a supersonic vertical and short takeoff and landing (V/STOL) fighter, model 279-3, modified to utilize a jet flap was evaluated. Replacing the rear nozzles of the 279-3 with the jet flap favorably alters the pressure distribution over the airfoil and dramatically increases lift. The result is a significant decrease in takeoff distance, an increase in payload, and an improvement in combat performance. To investigate the benefit in increased payload, the 279-3 and the jet flapped 279-3JF were modeled on the NASA Aircraft Synthesis (ACSYNT) computer code and flown on a 250 feet takeoff distance interdiction mission. The increase in payload weight that the 279-3JF could carry was converted into fuel in one case, and in another, converted to bomb load. When the fuel was increased, the 279-3JF penetrated into enemy territory almost four times the distance of 279-3, and therefore increased mission capability. When the bomb load was increased, the 279-3JF carried 14 bombs the same distance the 279-3 carried four. The increase in mission performance and improvements in turning rates was realized with only a small penalty in increased empty weight. Author

**LIQUID HYDROGEN FUELED PASSENGER AIRCRAFT**
Y. QIAN 11 Mar. 1986 11 p Transl. into ENGLISH from Hangkong Zhishi (China), no. 11, Nov. 1984 p 22-23
(AD-A166229; FTD-ID(RS)T-0862-85) Avail: NTIS HC A02/MF A01 CSCL 01C

The idea that passenger aircraft will eventually use liquid hydrogen fuel is discussed. There is a large reserve of hydrogen and hydrogen poses no danger to the environment. Hydrogen has high calorific value, high specific heat, low density and low temperature. Aircraft will have to have a liquid fuel tank to carry the hydrogen and will have to be partially redesigned. Lockheed and NASA have considered such designs. A problem remains in the planning--the high cost of large extraction of liquid hydrogen. GRA

(AD-A166803; AFWAL-TR-82-2022) Avail: NTIS HC A05/MF A01 CSCL 13L

An experiment investigation has been been carried out to determine the primary factors that have contributed to recent aircraft electrostatically induced ground refueling fire incidents. It was found that the explosion suppression open pore polyurethane fuel tank foams along with the charging characteristics of the JP-4 fuel resulted in charge accumulation and electrostatic spark discharging. The polyurethane foams accumulated charge due to their highly resistive nature (blue, 10 to the 15th power ohm-cm; red, 10 to the 14th power ohm-cm; yellow, to the 14th power ohm-cm; and orange, 10 to the 13th power ohm-cm). The fuel flow rate and velocity entering the tank and impinging on the open pore polyurethane foam directly affected the magnitude of the charge separation which was occurring. The number of refuelings that had taken place also was a critical factor due to its effect on charge accumulation/discharge frequency levels. The last major variable investigated was pro-static (Gulf-178) and conductivity improving (shell ASA-3) fuel additives. The Gulf-178 additive dramatically increased the levels of charge separation and accumulation taking place along with a reversal in the polarity of charge. The Shell ASA-3 fuel additive eliminated the aircraft ground refueling electrostatic discharge hazard decreasing the level of charge accumulation. GRA

**IDENTIFICATION AND ESTIMATION OF THE RANDOM ERROR MODELS FOR INERTIAL ACCELEROMETER AND BARO-ALTIMETER**
R. WANG (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 556-564. In Chinese, with abstract in English. refs

In accordance with the 'Flight Control' (SFB-58 Flugfuehrung) national research project in West Germany, it is necessary to develop an optimal baroradioinertial hybrid altimeter for the research aircraft DO-28. For this purpose, the random error models for vertical accelerometers on inertial platform and a barometric altimeter under the conditions of landing approach are identified and estimated with the aid of two onboard data acquisition systems. The optimal estimate of the ARIMA model of the associatd random error sources is obtained by the time series analysis. A number of actual problems, such as data preprocessing and effect of measurement noise on error model, are also discussed. Author

**BOEING DEVELOPING NEW COCKPIT DISPLAYS TO EASE PILOT WORKLOAD**
J. T. MERRIFIELD Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 23, 1986, p. 109, 110, 113.

A program being pursued to ready advanced cockpit displays and automated systems in order to manage the large volume of information that will be available to pilots of the USAF's advanced tactical fighter (ATF) is discussed. In the pictorial format cockpit concept being utilized, the ATF pilot will be assisted by an 'electronic copilot' equipped to automatically handle such tasks as flight and powerplant control, weapons management, and countermeasures. The system would also manage communications and navigation systems while informing the pilot of current tactical situations and advising him in the decision-making process. The research funding for this effort is discussed, and the simulation equipment utilized is described. The roles of the crew station information manager in the system is addressed, including his interaction with the pilot. A planned Kickoff demonstration of the system is described, and related developments in avionics are summarized. C.D.

**A86-45067**

### CREW SITUATIONAL AWARENESS DRIVES AVIONICS DEVELOPMENTS

M. A. DORNHEIM Aviation Week and Space Technology (ISSN 0005-2175), vol. 124, June 23, 1986, p. 114-116.

Avionics research being conducted to provide increased tactical situation awareness for fighter crews is discussed. The main aspects of situational awareness, finding targets while minimizing emissions, identifying targets, and displaying the information to the pilot, are discussed in terms of the display technology required. The features of a conceptual 'supercockpit' which will provide superior situational awareness are addressed, using the visually coupled airborne systems simulator (VCASS) as an example. The use of avionics modularity to control manufacturing costs and logistics is discussed, stressing the importance of reliability. The maintainability of these avionics systems is also discussed. C.D.

### THE ACCURACY OF AIR-TEMPERATURE AND FLIGHT-ALTITUDE MEASUREMENTS ABOARD METEOROLOGICAL AIRCRAFT [O TOCHNOSTI IZMERENIIA TEMPERATURY VOZDUKHA I VYSOTY POLETA NA SAMOLETAKH-METEOLABORATORIIAKH]

V. P. BELIAEV IN: Methods and technology for experimental studies of the atmosphere . Moscow, Gidrometeoizdat, 1985, p. 113-122. In Russian. refs

Measurement errors in determinations of air temperature, air speed, and flight altitude by means of airborne meteorological instruments are discussed. Data obtained by using different instruments to determine a given parameter are compared with one other and with radio-sounding data. For temperature measurements, a thermometer with a shielded thermal element is recommended to eliminate the cloud effect. It is also advisable to use the most exact equations, rather than approximating relationships, for calculations of flight altitude and air velocity, utilizing an airborne digital computer. I.S.

### WIND-SHEAR DETECTION - A REPORT ON THE FIRST SUCH AIRBORNE WARNING DEVICE TO BE COMMERCIALLY CERTIFIED

B. C. JOHNSTON (Sperry Corp., New York) ICAO Bulletin, vol. 41, March 1986, p. 14-17.

The Performance Management System (PMS) which contains an airborne wind shear detection and alert system is described. The main components of the alert system are a wind-shear computer and a detector. The system evaluates changes in the inertial and air-mass accelerations of aircraft and the annunciation of wind shear is provided to the flight crew using the PMS performance management indicator, a light on the PMS speed deviation indicator, and a flashing red lamp alert. The performance of the wind shear detection and alert system is tested using models and flight tests; it is observed that the system provides accurate and reliable wind shear data. The installation of a program into the system that will supply instructions to the crew on how to exit the wind shear is examined. I.F.

**A86-46141**

### TRENDS IN CIVIL AVIONICS FOR THE NEAR FUTURE

M. VIVET (Telecommunications Radioelectriques et Telephoniques, Paris, France) ICAO Bulletin, vol. 41, March 1986, p. 22-24.

The growth of avionics is examined. The early development of avionics equipment (1910-1940) is discussed. The use of transistors, semiconductors, and solid-state circuits in airborne equipment is described. The advantages of digital technology as compared to analog technology are studied. The present utilization of electronics and computers in integrated avionics equipment is analyzed. The digitalization of information and data processing methods, decreases in avionics maintenance costs, improvements in communication systems, and an automatic data management concept are proposed for future avionics systems. I.F.

### LIQUID-CRYSTAL GOGGLES PERMIT VISUAL SIMULATIONS OF RESTRICTED VISIBILITY

F. A. WATT, III (Instrument Flight Research, Inc., West Columbia, SC) ICAO Bulletin, vol. 41, May 1986, p. 34-36.

The present Instrument Meteorological Conditions Simulator reproduces the weather conditions seen by a pilot by means of a pair or liquid crystal lenses having electrically controllable opacity. The system encompasses a set of electronically controlled goggles worn by the trainee pilot and a controller subsystem that is operated by the instructor/safety pilot. The goggles may be worn on helicopter or aircraft helmets, or directly on the pilot's face. When simulating clouds or fog, the goggles reproduce the effect of a progressive obscuration of objects with increasing distance from the viewer. O.C.

### AN UPWARD LOOKING AIRBORNE MILLIMETER WAVE RADIOMETER FOR ATMOSPHERIC WATER VAPOR SOUNDING AND RAIN DETECTION

J. A. GAGLIANO and R. H. PLATT (Georgia Institute of Technology, Atlanta) IN: Millimeter wave technology III; Proceedings of the Meeting, Arlington, VA, April 9, 10, 1985 . Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1985, p. 112-117. refs

(Contract NAS5-28132; NAS5-28724)

A 90/180 GHz multichannel radiometer is currently under development for NASA's 1985 Hurricane Mission onboard the Convair 990 research aircraft. The radiometer will be a fixed beam instrument with dual corrugated horns and a common lens antenna designed to operate simultaneously at 90 and 180 GHz. The all solid state front-end will contain three double side band data channels at 90 + or - 3 GHz, 180 + or - 3 GHz, and 180 + or - 7 GHz. The airborne radiometer will mount in a window port on the CV-990 and will maintain a fixed beam view approximately 14 degrees off zenith. The radiometer design is a Dicke chopper arrangement selected to achieve maximum absolute temperature accuracy and minimum brightness temperature sensitivity. Analog outputs of the three data channels will be calibrated dc voltages representing the observed radiometric brightness temperatures over the selected integration time. Author

### DECISION AIDING FOR TACTICAL AIRCRAFT

M. BROADWELL, J. SMITH, J. BARNETTE, and C. STAROS (Lockheed-Georgia Co., Advanced Electronics Div., Marietta) IN: Applications of artificial intelligence II; Proceedings of the Meeting, Arlington, VA, April 9-11, 1985 . Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1985, p. 153-160. refs

Some of the tasks of the airborne mission/route planner system under development for tactical aircraft require symbolic reasoning on the basis of subjective and incomplete information. Other tasks call for precise and synchronized processing of aircraft control parameters, while others may be of a nature that is intermediate between the two extremes. Attention is given to this system's design and implementation approach, which involves the subdivision of the route planning problem into a hierarchy of reasoning abstractions reflecting the types of reasoning or

computation best suited to the various facets of the problem.

### AN INTELLIGENT AMPLIFIER AND ITS APPLICATION TO MODAL TESTING

R. D. TALMADGE (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 1 . Schenectady, NY, Union College, 1985, p. 507-510.

The design of the automatic gain ranging amplifier (AGRA) which is to provide the gain element in a data collection system is examined. The amplifier consists of a gain block, a presample filter with six poles and butterworth characteristics, a quasi-peak detector for gain control, and a line driver output. The use of a dual-tracking constant-current-circuit to supply bridge power and measure the differential IR drops across the elements is discussed. The performance characteristics and functions of the digitally contolled AGRA are described. The AGRA produces an analog signal output. The application of the amplifier to flight and ground testing of aircraft is analyzed.

### ANALOGUE SIGNAL CONDITIONING FOR FLIGHT TEST INSTRUMENTATION

D. W. VEATCH and R. BOGUE Apr. 1986 179 p
(AGARD-AG-160-VOL-17; ISBN-92-835-1520-X) Avail: NTIS HC A09/MF A01

The application of analog signal conditioning to flight-test data-acquisition systems is discussed. Emphasis is placed on practical applications of signal conditioning for the most common flight-test data-acquisition systems. A limited amount of theoretical discussion is included to assist the reader in a more complete understanding of the subject matter. Nonspecific signal conditioning, such as amplification, filtering, and multiplexing, is discussed. Signal conditioning for various specific transducers and data terminal devices is also discussed to illustrate signal conditioning that is unique to particular types of transducers. The purpose is to delineate for the reader the various signal-conditioning technique options, together with tradeoff considerations, for commonly encountered flight-test situations.

### IMPROVING THE INTERPRETABILITY OF AN AIRCRAFT ATTITUDE INDICATOR M.S. Thesis

M. A. DIPADUA 1986 59 p
(AD-A166329; AFIT/CI/NR-86-27T) Avail: NTIS HC A04/MF A01 CSCL 01D

Two display types and four aircraft size ratios were investigated in this thesis to determine their effect on attitude display interpretability. The two display designs used were an outside-in (moving plane) and an inside-out (moving horizon) display. The four aircraft symbol lengths were measured relative to the size of the artificial horizon (33 percent, 50 percent, 67 percent, 100 percent). Twenty flight naive subjects were tested in two phases with both display types and all four size ratios. The first phase tested subjects' reaction to the sudden awareness of a change in attitude. The dependent variables measured, reaction time and error rate, indicated a preference for the outside-in display. The small size ratio was significantly better than the larger ones with reaction time as the dependent variable. A significant difference between sizes was not the case when the dependent variable error rate was measured. The second phase consisted of a dynamic flying task on an Apple PC computer. The dependent measures were the root mean square (RMS) error due to roll and the RMS error due to pitch. A significant difference in display types, favoring the outside-in type, was found with the RMS error due to roll as the dependent measure. No significant differences were found when the RMS error due to pitch was used as the dependent measure. Sizes did, however, approach significance in this case.

### DESIGN, DEVELOPMENT AND INTEGRATE/INSTALL AN AIRBORNE REMOTE INSTRUMENTATION SYSTEM (AIREYE) Final Report

J. J. BOMMARITO and L. E. SAYLOR Aug. 1985 79 p
(Contract DTCG23-80-C-20012)
(AD-A166755; REPT-7921; USCG-D-27-85) Avail: NTIS HC A05/MF A01 CSCL 01C

A prototype airborne remote instrument system, AIREYE, was developed for the U.S. Coast Guard by Aerojet ElectroSystems Company. This multisensor system permits real-time day/night, all weather detection, mapping and documentation of vessels and pollution at sea. The system was installed aboard a coast Guard Hu-25A Falcon fanjet aircraft and flight tested off the California coast. Surveillance data were obtained from natural oil seeps, known optical and radar targets, routine shipping and targets of opportunity. The AIREYE system consists of a sidelooking radar, infrared/ultraviolet line scanner, active gated television systems, aerial reconnaissance camera and a processor/display recording subsystem with real-time digital image enhancement capability. The system reliably detected and mapped oil seeps and vessel locations for environmental conditions ranging from dense undercast to clear, windspeeds from 0 to greater than 25 knots and from daytime to total darkness. The ability to read a vessel's name and determine deck activity in total darkness was demonstrated. The AIREYE real-time digital enhancement provided detection, recognition and identification of targets of interest when not otherwise possible with unenhanced imagery. Test results demonstrated that the AIREYE system will provide greatly enhanced capability in the U.S. Coast Guard missions of Marine Environmental Protection (MEP), Enforcement of Laws and Treaties and Search and Rescue.

### AIRBORNE NAVIGATION REMOTE MAP READER EVALUATION Final Report, 1 Sep. 1984 - 30 Sep. 1985

J. C. BYRD Mar. 1986 56 p
(AD-A166976; ASD-TR-86-5004) Avail: NTIS HC A04/MF A01 CSCL 01C

The U.S. Air Force evaluated the Full-Color Remote Map Reader built by Thomson-CSF of France under the Foreign Weapons, Equipment, and Technology Evaluation program. The unit is used in a military aircraft to provide a moving map video display for the aircrew. Map data is contained in a 65-foot roll of 35mm film at 11.4:1 reduction, which allows approximately 550 sq. ft. of aeronautical charts of any standard scale to be stored in one cassette. The unit moves the film with microprocessor-controlled servo motors and performs scanning, rotation and zoom with a microprocessor-controlled flying spot scanner. It obtains navigation data from the aircraft MIL-STD-1553 data bus and presents video on a full-color, shadow-mask cathode ray tube. The evaluation determined that the moving map display is useful in several Air Force missions, and that the French map reader technology is roughly equivalent to devices recently developed in the U.S.

**PROPELLING THE AEROSPACE PLANE**

Mechanical Engineering (ISSN 0025-6501), vol. 108, June 1986, p. 32-36.

Attention is given to the design features, prospective performance levels and technology development aspects of the combined turbojet/scramjet propulsion system currently undergoing conceptual definition for the hypersonic/transatmospheric 'aerospace plane'. The scramjet engine design under intensive consideration is able to operate as a conventional ramjet from speeds of Mach 3.5 to 6, and then as a true scramjet from Mach 5 to 12. Acceleration to Mach 3.5 would be accomplished by a separate complement of turbojet engines. Attention is given to the characteristics of liquid hydrogen fuel that render it an advantageous propellant for such powerplants. O.C.

**THE NEXT HOT FIGHTER ENGINE**

J. S. PETTY, R. J. HILL, A. C. PICCIRILLO, and A. E. FANNING (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) Aerospace America (ISSN 0740-722X), vol. 24, June 1986, p. 40-43.

The U.S. Air Force's projected Advanced Tactical Fighter (ATF) will be the first such vehicle to cruise over long distances at supersonic speeds, without afterburning and without compromise of subsonic range. The ATF's STOL and high maneuverability requirements have been judged to require nonaxisymmetric vectoring and reversing nozzles, contrarotating turbine spools, high throughflow compressors, and digital electronic engine controls without hydromechanical backups. Several variable geometry features are also under consideration in the two technology demonstration engines currently under development in order to furnish balanced subsonic vs supersonic operating efficiencies. O.C.

E. RIKLI Zuerich, Eidgenoessische Technische Hochschule, Doktor der technischen Wissenschaften Dissertation, 1984, 121 p. In German. refs

The present investigation is concerned with a computational procedure for the cooled gas turbine, taking into account the determination of state variables, velocities, and the location of the meridian streamlines. This procedure makes it possible to calculate two-dimensional flow characteristics in an effective channel. The mass flow along the path of expansion is kept variable, corresponding to the introduction of cooling air. Attention is given to a geometrical description of the meridian channel, a one-dimensional solution, the stream function in a variable mass flow, the cooling air distribution function, changes of state in the two-dimensional case, a description of the streamlines, the initial solution for the meridian streamline characteristics, the equations of motion, a local coordinate system, the solution of the equilibrium condition in a control surface, a two-dimensional solution, and selected results. **DEVELOPMENT OF IN-FLIGHT THRUST MEASUREMENT PROCEDURES FOR AN AFTERBURNING TURBOFAN ENGINE**

E. C. ROONEY and C. E. WILT (U.S. Navy, Naval Air Systems Command, Washington, DC) AIAA, SAE, ASME, and ASEE, Joint Propulsion Conference, 21st, Monterey, CA, July 8-11, 1985. 12 p. Navy-sponsored research. refs

(AIAA PAPER 85-1405)

This paper presents a historical perspective of the development of in-flight thrust measurement procedures for a mixed-flow afterburning turbofan engine. Portions of this program were previously extracted for use in the examples used in SAE AIR-1703: 'In-Flight Thrust Determination'. The purpose of the in-flight thrust measurement program was to provide for economical definition of performance characteristics over a range of subsonic, transonic and supersonic flight conditions. Development of the in-flight thrust measurement procedures is discussed from the planning through flight phases, including: contract provisions, methodology, instrumentation, engine test cell program, thrust-drag accounting and flight validation. The initial flight results showed evidence of bias errors. Investigation of these errors ultimately led tto development of alternative in-flight thrust methodology. Author

(Contract NAS3-23720; NAS3-23051)
(AIAA PAPER 86-1892)

New experimental evidence which indicates the presence of leading edge and tip edge vortex flow on Prop-Fans is examined, and performance and noise consequences are addressed. It was shown that the tip edge vortex is a significant noise source, particularly for unswept Prop-Fan blades. Preliminary calculations revealed that the addition of the tip side edge source to single rotation Prop-Fans during take off conditions improved the agreement between experiment and theory at blade passing frequency. At high-speed conditions such as the Prop-Fan cruise point, the tip loading effect tends to cancel thickness noise. K.k.

**MECHANICAL DESIGN OF GAS TURBINE BLADING IN CAST SUPERALLOYS**
A. G. DODD (Rolls-Royce, Ltd., Derby, England) (Institute of Metals, Conference on Casting of Superalloys, London, England, Feb. 27, 1985) Materials Science and Technology (ISSN 0267-0836), vol. 2, May 1986, p. 476-485. refs

The mechanical design of hot turbine blading has two main phases: (1) optimization, which yields the choice of material, number of blades, and general configuration, and (2) detailed design of the particular features of the blades. The first phase makes use of the data available, which are usually limited, to provide an outline mechanical assessment of commercial viability. At this stage maximization of the lifetime to failure is considered in terms of the temperature and stress at each radial position. In the second phase, failure modes are considered in more detail. The methods used in both stages are discussed, with emphasis on material and manufacture, taking as an example the blading in civil aircraft gas turbines. Particular attention is paid to the problems of designing with single-crystal cast superalloys. Author

**TRANSMISSION LINE DESIGN FOR A POWER DISTRIBUTION SYSTEM AT 20 KHZ FOR AIRCRAFT**
L. W. ZELBY, J. B. MATHES, and J. W. SHAWVER Washington NASA Jul. 1986 38 p
(Contract NAG3-508)
(NASA-CR-3987; NAS 1.26:2987) Avail: NTIS HC A03/MF A01 CSCL 21E

A low inductance, low characteristic impedance transmission line was designed for a 20 kHz power distribution system. Several different conductor configurations were considered: strip lines, interdigitated metal ribbons, and standard insulated wires in multiwire configurations (circular and rectangular cylindrical arrangements). The final design was a rectangular arrangement of multiple wires of the same gauge with alternating polarities from wire to wire. This offered the lowest inductance per unit length (on the order of several nanohenries/meter) and the lowest characteristic impedance (on the order of one Ohm). Standard multipin connectors with gold-plated elements were recommended with this transmission line, the junction boxes to be internally connected with flat metal ribbons for low inductance, and the line to be constructed in sections of suitable length. Computer programs for the calculation of inductance of multiwire lines and of capacitances of strip lines were developed. Author

**MULTI-VARIABLE CONTROL OF THE GE T700 ENGINE USING THE LQG/LTR DESIGN METHODOLOGY**
W. H. PFEIL (General Electric Co., Lynn, Mass.), M. ATHANS, and H. A. SPANG, III (General Electric Co., Schenectady, N. Y.) Apr. 1986 16 p
(Contract NAG2-297)
(NASA-CR-177080; NAS 1.26:177080; LIDS-P-1547) Avail: NTIS HC A02/MF A01 CSCL 21E

The design of scalar and multi-variable feedback control systems for the GET700 turboshaft engine coupled to a helicopter rotor system is examined. A series of linearized models are presented and analyzed. Robustness and performance specifications are posed in the frequency domain. The linear-quadratic-Gaussian with loop-transfer-recovery (LQG/LTR) methodology is used to obtain a sequence of three feedback designs. Even in the single-input/single-output case, comparison of the current control system with that derived from the LQG/LTR approach shows significant performance improvement. The multi-variable designs, evaluated using linear and nonlinear simulations, show even more potential for performance improvement. Author

Experimental studies were conducted to investigate the flow and the performance of thrust augmenting ejectors for flight Mach numbers in the range of 0.5 to 0.8, primary air stagnation pressures up to 107 psig (738 kPa), and primary air stagnation temperatures up to 1250 F (677 C). The experiment verified the existence of the second solution ejector flow, where the flow after complete mixing is supersonic. Thrust augmentation in excess of 1.2 was demonstrated for both hot and cold primary jets. The experimental ejector performed better than the corresponding theoretical optimal first solution ejector, where the mixed flow is subsonic. Further studies are required to realize the full potential of the second solution ejector. The research program was started by the Flight Dynamics Research Corporation (FDRC) to investigate the characteristic of a high speed ejector which augments thrust of a jet at high flight speeds. **DYNAMIC ANALYSIS OF STRUCTURES WITH FLEXIBLE ROTORS**
M. GERADIN and N. KILL *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 477-485 1985
Avail: NTIS HC A99/MF E03

Analytical tools for the dynamic structural analysis of machines with rotating parts such as aircraft engines are described. The finite element analysis is used for discretization, and the rotating parts are described using a 3-D formalism which includes in the kinetic energy expression the gyroscopic effects induced by the local changes of angular velocity produced by the deformation. The implementation of the formalism is specialized to the modeling of flexible rotors made of shafts and disks typical of modern aircraft engines. The effectiveness of the component mode synthesis method to reduce the size of the system of equations is demonstrated in the case of systems made of rotating and fixed parts. Critical speed and stability analyses and unbalance response calculations are performed by a sweeping procedure. The concepts are applied to the dynamic analysis of a high by-pass ratio aircraft engine. ESA

High-frequency response probes which had previously been used exclusively in the MIT Blowndown Facility were successfully employed in two conventional steady state axial flow compressor facilities to investigate the unsteady flowfields of highly loaded transonic compressors at design point operation. Laser anemometry measurements taken simultaneously with the high response data were also analyzed. The time averaged high response data of static and total pressure agreed quite well with the conventional steady state instrumentation except for flow angle which showed a large spread in values at all radii regardless of the type of instrumentation used. In addition, the time resolved measurements confirmed earlier test results obtained in the MIT Blowdown Facility for the same compressor. The results of these tests have further revealed that the flowfields of highly loaded transonic compressors are heavily influenced by unsteady flow phenomena. The high response measurements exhibited large variations in the blade to blade flow and in the blade passage flow. The observed unsteadiness in the blade wakes is explained in terms of the rotor blades' shed vorticity in periodic vortex streets. The wakes were modeled as two-dimensional vortex streets with finite size cores. The model fit the data quite well as it was able to reproduce the average wake shape and bi-modal probability density distributions seen in the laser anemometry data. The presence of vortex streets in the blade wakes also explains the large blade to blade fluctuations seen by the high response probes which is simply due to the intermittent sampling of the vortex street as it is swept past a stationary probe. (NASA-CR-176947; NAS 1.26:176947; JM/86-6) Avail: NTIS HC A13/MF A01 CSCL 21E

A method was developed which calculates two-dimensional, transonic, viscous flow in ducts. The finite volume, time marching formulation is used to obtain steady flow solutions of the Reynolds-averaged form of the Navier Stokes equations. The entire calculation is performed in the physical domain. The method is currently limited to the calculation of attached flows. The features of the current method can be summarized as follows. Control volumes are chosen so that smoothing of flow properties, typically required for stability, is now needed. Different time steps are used in the different governing equations to improve the convergence speed of the viscous calculations. A new pressure interpolation scheme is introduced which improves the shock capturing ability of the method. A multi-volume method for pressure changes in the boundary layer allows calculations which use very long and thin control volumes. A special discretization technique is also used to stabilize these calculations. A special formulation of the energy equation is used to provide improved transient behavior of solutions which use the full energy equation. The method is then compared with a wide variety of test cases. The freestream Mach numbers range from 0.075 to 2.8 in the calculations. Transonic viscous flow in a converging diverging nozzle is calculated with the method; the Mach number upstream of the shock is approximately 1.25. The agreement between the calculated and measured shock strength and total pressure losses is good. Essentially incompressible turbulent boundary layer flow in a adverse pressure gradient is calculated and the computed distribution of mean velocity and shear stress are in good agreement with the measurements. At the other end of the Mach number range, a flat plate turbulent boundary layer with a freestream Mach number of 2.8 is calculated using the full energy equation; the computed total temperature distribution and recovery factor agree well with the measurements when a variable Prandtl number is used through the boundary layer. The objective is to extend the recent advances in robust control system design of multivariable systems to sensor failure detection, isolation, and accommodation (DIA), and estimator design. This effort provides analysis tools to quantify the trade-off between performance robustness and DIA sensitivity, which are to be used to achieve higher levels of performance robustness for given levels of DIA sensitivity. An innovations-based DIA scheme is used. Estimators, which depend upon a model of the process and process inputs and outputs, are used to generate these innovations. Thresholds used to determine failure detection are computed based on bounds on modeling errors, noise properties, and the class of failures. The applicability of the newly developed tools are demonstrated on a multivariable aircraft turbojet engine example. A new concept call the threshold selector was developed. It represents a significant and innovative tool for the analysis and synthesis of DIA algorithms. The estimators were made robust by introduction of an internal model and by frequency shaping. The internal mode provides asymptotically unbiased filter estimates.The incorporation of frequency shaping of the Linear Quadratic Gaussian cost functional modifies the estimator design to make it suitable for sensor failure DIA. The results are compared with previous studies which used thresholds that were selcted empirically. Comparison of these two techniques on a nonlinear dynamic engine simulation shows improved performance of the new method compared to previous techniques Author

The feasibility study has shown that a dump/fill type torque converter has excellent potential for the convertible fan/shaft engine. The torque converter space requirement permits internal housing within the normal flow path of a turbofan engine at acceptable engine weight. The unit permits operating the engine in the turboshaft mode by decoupling the fan. To convert to turbofan mode, the torque converter overdrive capability bring the fan speed up to the power turbine speed to permit engagement of a mechanical lockup device when the shaft speed are synchronized. The conversion to turbofan mode can be made without drop of power turbine speed in less than 10 sec. Total thrust delivered to the aircraft by the proprotor, fan, and engine during tansient can be controlled to prevent loss of air speed or altitude. Heat rejection to the oil is low, and additional oil cooling capacity is not required. The turbofan engine aerodynamic design is basically uncompromised by convertibility and allows proper fan design for quiet and efficient cruise operation. Although the results of the feasibility study are exceedingly encouraging, it must be noted that they are based on extrapolation of limited existing data on torque converters. A component test program with three trial torque converter designs and concurrent computer modeling for fluid flow, stress, and dynamics, updated with test results from each unit, is recommended. **TIME RESOLVED AND TIME AVERAGED FLOW EVALUATION FOR AN ISOLATED TRANSONIC COMPRESSOR ROTOR Final Report**

F. NEUHOFF Mar. 1986 61 p
(Contract N00014-84-C-0766)
(AD-A166759; TR-8601) Avail: NTIS HC A04/MF A01 CSCL 20D

A 0.28-m single stage transonic fan was operated in a rotor only configuration. Overall performance was measured and radial distributions of inlet and outlet velocity were obtained using time-averaging combination temperature-pneumatic probes. These results were compared to the prediction of a finite element computer code (TURBOFEM) prediction. The blade-to-blade velocity and pressure distributions were measured using the Dual Probe Digital Sampling technique (involving two commercial semi-conductor probes of simple design). Data were obtained from hub-to-tip at both near-sonic and at supersonic inlet relative Mach numbers. The rotor losses were derived as blade-to-blade distributions and the shock losses were evaluated as components of the total loss at each radius. Based on the limited data obtained near sonic conditions, a combination of the profile loss model of Koch & Smith and shock loss model of Dunker was found to predict the measured radial loss distribution quite well. Preliminary observations of rotor shock oscillations were also reported. Compressor rotors, Compressor stators, Transonic flow, Turbomachinery flow fields, Transonic loss measurements, and Finite element codes. GRA

**JET-ENGINE COMBUSTOR SPECTRAL RADIATION MEASUREMENTS USING FIBEROPTIC INSTRUMENTATION SYSTEM. RADIANT ENERGY POWER SOURCE FOR JET AIRCRAFT Final Report**

O. L. DOELLNER Feb. 1986 121 p
(Contract DE-FG01-82CE-15144)
(DE86-007289; DOE/CE-15144/T2) Avail: NTIS HC A06/MF A01

This report is a summary of spectral radiation measurements made at Williams Air Force Base, Chandler, Arizona on a General Electric J-85-5 engine. The spectral radiation measurements consisted of a complete axial profile down the combustor and are directed toward the application of Radiant Energy Power Source for Jet Aircraft. Radiant Energy Power Source for Jet Aircraft relates to the use of photovoltaic cells to generate the electrical power demands of the aircraft. The photovoltaic cells are mounted inside the casing of the jet engine, are thermally insulated from the normally hot engine casing, and are appropriately cooled. The photovoltaic cells receive their required radiant energy from the combustion flame by holes in the combustion liner. The instrumentation system used to make these measurements employed fiberoptic probes - entering the engine by way of an existing (modified) access plate - to obtain the radiation measurements. Such an instrumentation system has the strong advantage of being able to measure radiation from all the holes running axially down the combustor without making any holes in the plenum/engine casing - as would be necessary if sapphire observation windows were used. **CONTROLLABILITY OF REDUNDANT FLIGHT CONTROL SYSTEM AND PRESSURE EQUALIZATION OF REDUNDANT SERVO ACTUATORS**

S. GUO (Nanjing Aeronautical Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, Feb. 1986, p. 71-79. In Chinese, with abstract in English.

A study on the control behavior of a redundant flight control system is carried out. The controllability of the redundant system and the effects of bias on the dynamic response of the controllable and uncontrollable state variables is stressed. The conclusions are extended to the pressure equalization problem of redundant servo actuators. Then a type of proportional plus integral digital equalization loop is designed. The good behavior of equalization is verified through experiments. Author

**DESIGN AND RESEARCH OF AIRCRAFT PARAMETER-ADAPTIVE LATERAL COMMAND AUGMENTATION SYSTEMS**

S. XIAO and W. ZHANG (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, Feb. 1986, p. 80-90. In Chinese, with abstract in English.

A scheme of parameter-adaptive command augmentation system (CAS) is designed for a supersonic-jet's lateral motions. Its digital simulation is also investigated. The purpose of the work is to provide the aircraft with superior handling qualities against rapid variation of the aircraft's lateral parameters and effect of external disturbances. The behavior of CAS during constant altitude-coordination both at constant and decreasing speed, as well as under stochastic side-gust disturbances is addressed. The time responses of the aircraft with CAS are compared with those of the free aircraft under the above conditions. It is shown that the version of the adaptive CAS is superior in anti-disturbance and adaptability to time-varying parameters. The microcomputer implementation of the parameter-adaptive lateral CAS and the choice of the microcomputer are also considered. Author

**AN ADAPTIVE FLIGHT CONTROL SYSTEM DESIGN FOR CCV WITH AN UNKNOWN INTERACTOR MATRIX**

K. KANAI and S. UCHIKADO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 34, April 1986, p. 211-221. In Japanese, with abstract in English. refs

A design method for a Control Configured Vehicle adaptive flight control system with an unknown interactor matrix is proposed whose matrix is uniquely constructed from a controlled system and helps determine the control law. The system is applied to the case of small-sized and high speed aircraft with vertical canard and flap control surfaces, and its effectiveness is demonstrated by a numerical simulation. R.R.

**AIRCRAFT FLUTTER ANALYSIS (THE FOURTH JOHN WESTON MEMORIAL LECTURE)**

A. J. VERMEULEN (Council for Scientific and Industrial Research, National Institute for Aeronautics and Systems Technology, Pretoria, Republic of South Africa) Aeronautica Meridiana (ISSN 0257-8573), vol. 6, no. 1, 1985, p. 1-12.

A comprehensive account is given of current methods for the study and analysis of flutter in aircraft structures, with particular reference to such high performance aircraft cases as the oscillation of a fighter wing with wingtip missiles. After a development history of flutter analysis and design methods, attention is given to analytical techniques, ground vibration testing, unsteady aerodynamics, the solution of the flutter equation, and the wind tunnel testing of dynamically similar models. O.C.

**NAVY DEPARTURE/SPIN AND AIR COMBAT MANEUVERING EVALUATION OF A NATIONAL AERONAUTICS AND SPACE ADMINISTRATION DEVELOPED FLIGHT CONTROL SYSTEM FOR THE F-14**

C. M. BAUCOM and C. CLARK (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 162-177.

An account is given of work done under a program involving NASA, Grumman Aerospace Corp., and the Navy, intended to design a system that would prevent spins without compromising the tactical maneuvering capability of the F-14. (As currently flown by the operational Navy) the F-14 exhibits two extremely undesirable flying qualities characteristics in the high angle-of-attack flight regime. First, lateral control surface deflections at high AOA can induce departure which may progress into an unrecoverable flat spin if recovery control inputs are delayed. Second, basic flying qualities are significantly degraded (typically by wing rock and lateral control reversal) at high AOA, thus increasing pilot workload in the tactical environment. An automatic-rudder interconnect (ARI) system was developed and enhanced with a low speed/high AOA cross control capability. Topics covered include: test airplane description; external store configurations; test site; simulation support of the flight test effort; and flight tests. The ARI concepts provided significantly improved high AOA flying qualities characteristics for the F-14. No serious degradation to the departure/spin resistance characteristics resulted. The low speed/high AOA cross control modification was successfully integrated into the flight control system; this option permitted the pilot to override the differential stabilator limiting and the lateral-stick-to-rudder-interconnect features, thus retaining the gross lateral control capability that currently exists in the production F-14. Future plans for further development of the ARI are noted. D.H.

**A320 FLIGHT CONTROLS**

S. G. CORPS (Airbus Industrie, Toulouse, France) IN: Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1985, p. 196-210.

The A320 widebody twin aircraft is discussed with emphasis on the flight controls. The A320 is the successor to the A300 and A310, which employed a number of new technologies. The new aircraft will use the fly-by-wire technology proven on the A310 and on Concorde, with a type of controller permitting the aircraft to survive a short term total electrical failure by manually changing the flight path if necessary. (Probability of needing such a fly-by-wire failure mode is less than one in a billion per hour; Concorde has full mechanical reversion which has never had to be used). Side stick control will be used rather than center stick. The fly-by-wire architecture is to be developed by Aerospatiale (the French partner of Airbus Industrie). Control in pitch, envelope protection (overspeed), stall protection, windshear protection, maneuver protection, attitude protection, control in roll, and yaw control are discussed. In connection with side stick operation, side stick coupling, the training situation, the take-over situation and system redundancy are covered. Counting options to buy, as of August 1985 (18 months before the first flight), the order book stood at about 200 aircraft. D.H.

**PRELIMINARY DESIGN OF LOW AUTHORITY SAS. II**

T. HACKER (Institute of Aviation, Bucharest, Rumania) and B. TEODORESCU (Bucuresti, Institutul Politehnic, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 31, Jan.-Feb. 1986, p. 3-12. refs

The region of admissible feedback gains is constructed for the Dutch roll mode. The time constant of the washout filter in the rudder loop is chosen as a tradeoff between response time and the interaction of the washout mode with fast lateral-directional air-frame modes. Perturbation methods are shown to provide the theoretical background to model simplification and to enable the assessment of the validity of simplified models. Author

**A86-45144**

**NUMERICAL MODELLING OF THE DYNAMICS OF AEROBATIC MANOEUVRES**

Z. DZYGADLO and R. BOLDAK Journal of Technical Physics (ISSN 0324-8313), vol. 26, no. 2, 1985, p. 225-245. refs

A method for calculating the plane and spatial aerobatic maneuvers of an aircraft assumed to be a rigid body, its control systems being displaceable but rigid, is discussed. The equations of motion constitute a complete, nonlinear set in a reference frame connected with the aircraft. The laws of control assume the aerodynamic characteristics and the data set for the TS-11 Iskra jet trainer. Numerical results are reported on the dynamics of an aircraft performing a loop or a roll; these results permit the influence of motion and control parameters on the behavior of the aircraft during these maneuvers to be determined. C.D.

**THE DYNAMICS OF LIMITING HELICOPTER MANEUVERS AT A VERY LOW ALTITUDE [DYNAMIKA GRANICZNYCH MANEWROW SMIGLOWCA W LOTACH NISKICH]**

K. SZUMANSKI Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 102, 1985, p. 3-38. In Polish. refs

The problems under consideration are those of a helicopter flying in the proximity of the ground including hovering, load lifting, and rescue operations, hedgehopping flights (during agricultural work, for instance) and the phases of flight near the ground (takeoff and landing). Helicopter maneuvers under normal conditions and in the case of a power system failure are analyzed. The limits of the possibility of performing such maneuvers are estimated assuming that full use is made of the functional and structural properties of the system composed of the aircraft and the pilot. **CONTROL OF V/STOL AIRCRAFT**

J. A. FRANKLIN (NASA, Ames Research Center, Moffett Field, CA) Aeronautical Journal (ISSN 0001-9240), vol. 90, May 1986, p. 157-173. refs

This paper deals with control of V/STOL aircraft in powered-lift flight. A review of representative operational mission tasks is presented for the take-off, transition, hover and landing flight phases. Characteristics inherent in the basic airframe and propulsion system and the behavior associated with control augmentation systems are considered. Demands for augmented stability and control response to meet certain mission operational requirements are discussed. Experience from ground-based simulation and flight experiments that illustrates the impact of augmented stability and control on aircraft design is related by example. Author

**A SIMULATION OF AN INTEGRATED FLIGHT CONTROL/AIR-GROUND CANNON FIRING SYSTEM [SIMULATION D'UN SYSTEME INTEGRE DE COMMANDES DE VOL ET DE CONDUITE DE TIR CANON AIR-SOL]**

B. DANG VU and C. LA BURTHE (ONERA, Chatillon-sous-Bagneux, France) (NATO, AGARD, Symposium on Improvement of Combat Performance for Existing and Future Aircraft, Treviso, Italy, Apr. 14-18, 1986) ONERA, TP, no. 1986-31, 1986, 15 p. In French. refs

(ONERA, TP NO. 1986-31)

Results are reported on an ONERA study of an integrated flight and fire control system (IFFC) for modern attack aircraft. The IFFC was developed to furnish flight stability in the ground attack phase and to maximize the success of an air-ground strafing run. Maximizing the performance of the maneuver depended on integrating the pilot in the loop while minimizing the pilot workload. The pilot selected a target which the on-board computer maintained on a cockpit display while aiming the cannon, i.e., the aircraft. Target tracking therefore activated the control laws for guiding the aircraft toward the target. In the simulation, statistics were kept on the success of the firing and the success at maintaining a flight path to the target. The IFFC was effective at both guidance and workload alleviation tasks, and was compact enough for incorporation in current flight control and guidance computer systems. M.S.K.

**AN ANALYSIS OF THE MOTION OF AN AIRCRAFT ON THE GROUND [ANALIZA RUCHU SAMOLOTU NA ZIEMI]**

A. WOJNAROWSKI and W. KOWALSKI Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 103, 1985, p. 3-20. In Polish. refs

The method and the results of an analysis of the control problem of an aircraft in its motion on the ground are presented. It is assumed that the aircraft performs a translational motion along the runway and angular oscillation, forced by the control system, about the center of gravity. Two methods of analysis are suggested: a simplified operational method for a system with a single degree of freedom and a more universal numerical method, on the basis of which the characteristics of motion of the aircraft for a two-degree-of-freedom system have been determined. The computation methods make it possible to characterize in an accurate manner the motion of the aircraft and to select the optimum excitation range, which is a condition for correct design of the ground steering system. **DISTURBANCE ATTENUATION BY A FREQUENCY-SHAPED LINEAR-QUADRATIC-REGULATOR METHOD**

H. IMAI (Setsunan University, Osaka, Japan), N. ABE (Mitsubishi Heavy Industry Co., Ltd., Nagoya, Japan), and M. KOBAYAKAWA (Kyoto University, Japan) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, July-Aug. 1986, p. 397-402. refs

The problem of designing a control system such that the effect of disturbances can be attenuated while the stability of the closed-loop system is assured are considered. It is shown that a linear-quadratic regulator method with frequency-dependent weighting matrices can be effectively applied to this problem. Some inequalities that connect those weighting matrices to the return-difference matrix of a feedback control system are derived. Using these inequalities, the minimum singular value of the return-difference matrix of a feedback control system can be designed quite easily. C.D.

**A DISCRETE-TIME MULTIVARIABLE MODEL-FOLLOWING METHOD APPLIED TO DECOUPLED FLIGHT CONTROL**

K. KANAI (Defense Academy, Yokosuka, Japan), P. N. NIKIFORUK (Saskatchewan, University, Saskatoon, Canada), and N. HORI Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, July-Aug. 1986, p. 403-407. refs

(AIAA PAPER 85-1978)

The discrete-time version of the multivariable model-following control method, previously presented by the authors of this paper, is described. The modification of the control law that enables the control vector to be calculated at each instant using the past state vectors is also presented for synchronizing the change in the control input with the sampling instant. An alternative method of control is developed for a system whose high-frequency gain matrix is singular. This design requires a lower-order increase in the controller and makes the selection of the reference model easier than the method previously proposed by the authors. As an example, the design of the control system is given for flight control of an aircraft that has control-configured vehicle capabilities. The simulation study is carried out for a hypothetical T-2-CCV aircraft, with particular reference to a longitudinal mode. Author

**UNFOLDING OF DEGENERATE HOPF BIFURCATION FOR SUPERSONIC FLOW PAST A PITCHING WEDGE**

N. SRI NAMACHCHIVAYA (Illinois, University, Urbana) and H. J. VAN ROESSEL (Western Ontario, University, London, Canada) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090) vol. 9, July-Aug. 1986, p. 413-418. refs

This paper investigates the stability and bifurcation behavior of a double-wedge aerofoil performing a pitching motion at high angles of attack. When a pair of complex conjugate eigenvalues crosses the imaginary axis of the eigenvalue plane, the trivial solution loses stability giving rise to a periodic solution, known as Hopf bifurcation, provided certain transversality conditions are not violated. The existence of degenerate Hopf bifurcation due to the violation of Hopf's transversality condition at certain critical values of the system parameters is shown. The behavior of the pitching motion near these critical values is examined by unfolding the degeneracies. For the supersonic double-wedge aerofoil, various parameters defining the bifurcation paths were numerically evaluated. Author

**COMPARISON OF ANGULAR AND METRIC GUIDANCE LAWS FOR TACTICAL MISSILES**

J.-L. DURIEUX (Cabinet d'Etudes Techniques d'Automatisation, Angouleme, France) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, July-Aug. 1986, p. 505-507. refs

An angular guidance law for tactical missiles optimized by the adjoint technique is compared with a metric law for such missiles comprising an estimator connected to a terminal controller forcing the estimated miss distance to zero. The terms of comparison are miss distance and realizability. An analytic solution is given for one specific, significant case. It is concluded that linear-quadratic Gaussian optimization, without constraint on commanded acceleration and with stationary measurement and process noise, yields the same theoretical minimum miss distance irrespective of whether the control law is angular or metric. If an approximate angular law is used, the resulting performance degradation is inversely proportional to measurement noise. The metric law produces a performance advantage as a result of time-to-go measurement, which produces a better missile lateral acceleration history against a maneuvering target. C.D.

(NASA-CR-177126; NAS 1.26:177126; SU-SUDAAR-553) Avail: NTIS HC A10/MF A01 CSCL 01C

The successive loop closures synthesis method is the only method for multirate (MR) synthesis in common use. A new method for MR synthesis is introduced which requires a gradient-search solution to a constrained optimization problem. Some advantages of this method are that the control laws for all control loops are synthesized simultaneously, taking full advantage of all cross-coupling effects, and that simple, low-order compensator structures are easily accomodated. The algorithm and associated computer program for solving the constrained optimization problem are described. The successive loop closures , optimal control, and constrained optimization synthesis methods are applied to two example design problems. A series of compensator pairs are synthesized for each example problem. The succesive loop closure, optimal control, and constrained optimization synthesis methods are compared, in the context of the two design problems. Author

Avail: NTIS HC A02/MF A01 CSCL 01C

Flight control systems have undergone a revolution since the days of simple mechanical linkages; presently the most advanced systems are full-authority, full-time digital systems controlling unstable aircraft. With the use of advanced control systems, the aerodynamic design can incorporate features that allow greater performance and fuel savings, as can be seen on the new Airbus design and advanced tactical fighter concepts. These advanced aircraft will be and are relying on the flight control system to provide the stability and handling qualities required for safe flight and to allow the pilot to control the aircraft. Various design philosophies have been proposed and followed to investigate system architectures for these advanced flight control systems. One major area of discussion is whether a multichannel digital control system should be synchronous or asynchronous. This paper addressed the flight experience at the Dryden Flight Research Facility of NASA's Ames Research Center with both synchronous and asynchronous digital flight control systems. Four different flight control systems are evaluated against criteria such as software reliability, cost increases, and schedule delays. Author

**MODEL-FOLLOWING CONTROL FOR AN OBLIQUE-WING AIRCRAFT**

G. S. ALAG, R. W. KEMPEL, J. W. PAHLE, J. J. BRESINA, and F. BARTOLI Aug. 1986 13 p Presented at the AIAA Conference on Guidance and Control, Williamsburg, Va., 18-20 Aug. 1986
(NASA-TM-88269; H-1362; NAS 1.15:88269; AIAA-86-2244CP)
Avail: NTIS HC A02/MF A01 CSCL 01C

A variable-skew oblique wing offers a substantial aerodynamic performance advantage for aircraft missions that require both high efficiency in subsonic flight and supersonic dash or cruise. The most obvious characteristic of the oblique-wing concept is the asymmetry associated with wing-skew angle which results in significant aerodynamic and inertial cross-coupling between the aircraft longitudinal and lateral-directional axes. A technique for synthesizing a decoupling controller while providing the desired stability augmentation. The proposed synthesis procedure uses the cncept of explicit model following. Linear quadratic optimization techniques are used to design the linear feedback system. The effectiveness of the control laws developed in achieving the desired decoupling is illustrated for a given flight condition by application to linearized equations of motion, and also to the nonlinear equations of six degrees of freedom of motion with nonlinear aerodynamic data. **EIGENSYSTEM SYNTHESIS FOR ACTIVE FLUTTER SUPPRESSION ON AN OBLIQUE-WING AIRCRAFT**

G. S. ALAG (University of Western Michigan, Kalamazoo.), J. J. BURKEN, and G. B. GILYARD Aug. 1986 9 p Presented at the AIAA Guidance, Navigation and Control Conference, Williamsburg, Va., 18-20 Aug. 1986

(NASA-TM-88275; H-1359; NAS 1.15:88275; AIAA-86-2243-CP)

Avail: NTIS HC A02/MF A01 CSCL 01C

The application of the eigensystem synthesis technique to place the closed-loop eigenvalues and shape the closed-loop eigenvectors has not been practical for active flutter suppression, primarily because of the availability of only one control surface (aileron) for flutter suppression. The oblique-wing aircraft, because of its configuration, provides two independent surfaces (left and right ailerons), making the application of eigensystem synthesis practical. This paper presents the application of eigensystem synthesis using output feedback for the design of an active flutter suppression system for an oblique-wing aircraft. The results obtained are compared with those obtained by linear quadratic Gaussian techniques. Author

Linear multiple-input multiple-output (multivariable) control systems are considered. The intent of this report is to familiarize the working engineers with some of the developments in the area of robust multivariable control theory that have occurred in the past 10 years. The concepts of singular values are used to systematically develop robust control systems analysis and design techniques. The advantages and limitations of these techniques are discussed. Examples are used to illustrate the methods. Author (GRA)

**ACTIVE FLUTTER SUPPRESSION ON A DELTA WING MODEL STRUCTURE**

R. FREYMANN and K. CHENG Dec. 1985 72 p

(DFVLR-FB-86-01; ISSN-0171-1342; ESA-86-97455) Avail: NTIS HC A04/MF A01; DFVLR, Cologne, West Germany DM 26

Active flutter suppression systems were designed for a flexible model delta wing structure based either on the concept of fictitious structural modifications or on frequency response methods. For validation of the results from the analytical investigations, extensive tests were performed on the model delta wing structure in a 3m x 3m low speed wind tunnel. During the tests the flutter speed of the actively controlled wing was increased by 25% compared to the basic, uncontrolled system. Good agreement between calculated and measured results is found. ESA

**APPLICATION OF TRANSONIC UNSTEADY METHODS FOR CALCULATION OF FLUTTER AIRLOADS**

H. ZIMMERMANN and S. VOGEL *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 47-61 1985

Avail: NTIS HC A99/MF E03

The supercritical MBB-A3 profile was used as an example for calculating steady and unsteady pressure distribution by unsteady transonic codes. Most of the calculations were performed using the nonlinear TSP-equation and its time linearized form solved by a time marching method and by an integral method. The influence of the coefficient of the nonlinear term, of the inclusion of the steady or quasi-steady boundary layer thickness, and of the fulfillment of the Rankine-Hugoniot condition on the resulting pressure distribution is shown. Flutter calculations were made for a two degree of freedom representative section. The resulting critical speeds show a considerable variation depending on which method was used. Results show that there are good arguments for using time-linearized TSP methods in flutter calculations in the transonic domain. ESA

**THEORETICAL FLUTTER INVESTIGATIONS ON A PLANE CASCADE IN INCOMPRESSIBLE FLOW**

V. CARSTENS *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 169-179 1985

Avail: NTIS HC A99/MF E03

An analysis which predicts the aeroelastic behavior of a plane cascade in incompressible flow is presented. The unsteady aerodynamic forces and moments acting on the blades are calculated by the method of surface layers. In the general case of bending and/or torsional modes, this method is based on the simultaneous solution of two linear integral equations of the second kind which contain the interaction of steady and unsteady blade loading as well as the influence of all other specific cascade parameters. The solution of the flutter equations for a two degree of freedom model is discussed on the basis of a given cascade configuration. ESA

**A NUMERICAL ANALYSIS FOR VERTICAL GUST FIELD INDUCED BY GUST GENERATOR**

Y. YANG and J. WANG *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 187-193 1985

Avail: NTIS HC A99/MF E03

A method for calculating vertical gust field induced by a gust generator, which consists of a group of oscillating vanes, based on subsonic unsteady lifting surface theory is presented. When the geometry of the gust generator, oscillating frequency and amplitude, and Mach number are given, the unsteady downwash field can be determined. In the calculation, the interference among the vanes is considered. Through numerical calculation, the characteristics of the vertical gust field induced by one, two, or three vanes with various reduced frequencies and Mach numbers are investigated. The influence of the gust generator on the characteristics of the vertical gust field are discussed, and conclusions for gust wind tunnel design are outlined. ESA

**A REVIEW OF AEROELASTIC RESEARCH AT THE FLIGHT DYNAMICS LABORATORY**

T. M. HARRIS, T. E. NOLL, T. J. HERTZ, and W. A. SOTOMAYER *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 233-243 1985

Avail: NTIS HC A99/MF E03

Research on aeroservoelasticity, adaptive flutter suppression, the effects of stores carriage on body freedom flutter, and three dimensional transonic unsteady aerodynamics is discussed.

Aeroservoelasticity studies involve research to develop tools for aeroelastic analyses of aircraft when active feedback control systems are taken into account. Adaptive flutter suppression for aircraft carrying external stores is evaluated by wind tunnel tests. Subsonic wind tunnel tests were performed to evaluate the effect of store location, mass, and inertia on aeroelastic stability. ESA

**AEROELASTIC WIND TUNNEL SIMILARITY THEORY FOR ANISOTROPIC AIRCRAFT WINGS**
G. A. OYIBO *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 257-264 1985
Avail: NTIS HC A99/MF E03

A theory outlining a simplified approach for aeroelastically simulating anisotropic aircraft wings is presented. An examination of the fundamental aeroelastic equations of motion for anisotropic aircraft wings, with the help of affine transformations, reveals that a unified simulation theory, which reduces to the existing theory in the isotropic limit can be formulated. It is discovered that the necessary condition for preserving the Strouhal number (reduced frequency) between the real aircraft wing and its wind tunnel model is by preserving the generalized forms of the similarity parameters suggested by Theodorsen and Garrick as well as new parameters. The additional similarity parameters reflect directional and coupling stiffness properties of anisotropic materials in a given aerospace structure. The results reduce to those for aircraft wings fabricated of isotropic materials if these new parameters are set equal to zero. ESA

V. J. E. STARK *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 276-285 1985
Sponsored by Swedish Defence Administration and Saab Scania A.B.
Avail: NTIS HC A99/MF E03

A flutter and response program based on general equations of motion is described. The equations are solved by Laplace transformation and by reducing the inversion integral to a sum of the residues at the poles at the zeros of the determinant. The resulting nonlinear eingenvalue problem, i.e., the problem of finding the zeros, is solved by the Newton-Raphson formula with numerical methods for calculation of the determinant and the principle of the argument for finding initial approximations. The program permits choice of different kinds of analytic functions in the linear approximation that is employed for approximating the aerodynamic transfer functions. Equations representing control laws of a flutter suppression system can be included. ESA

**THE DESIGN AND WIND TUNNEL DEMONSTRATION OF AN ACTIVE CONTROL SYSTEM FOR GUST LOAD ALLEVIATION AND FLUTTER SUPPRESSION**
I. W. KAYNES, C. W. SKINGLE, and J. C. COPLEY *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 330-347 1985
Avail: NTIS HC A99/MF E03

Wind tunnel tests on a flexible model with an active control system are described. A flutter suppression control law was designed and tested. It is shown that flutter suppression is achieved in the presence of gusts. The mathematical model of the aircraft includes descriptions of the whole aircraft motion and the flexible aircraft deformations. Physically realistic modifications were made to the mathematical model to enhance the agreement between predictions and the measured loads and responses. Physical understanding of the active controls is facilitated by an interactive control system design package. The predicted and measured performance of the control laws are presented. ESA

**TAILORING METHODOLOGY FOR AEROELASTIC STABILITY AND LATERAL CONTROL ENHANCEMENT**
T. A. WEISSHAAR *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 415-425 1985
Avail: NTIS HC A99/MF E03

Uses of aeroelastic tailoring to enhance aircraft structural design for dynamic response are discussed. The incorporation of directional stiffness into a design may alter drastically the mode shapes and frequencies of lifting surface. This alteration affects dynamic aeroelastic interactions between modal forces as well as the modal forces themselves. Tailoring to increase flutter speed generally produces a degradation of the classical divergence speed. As a result, the freedom of the wing to move as a rigid body in concert with the fuselage may render the aircraft susceptible to an attitude instability called body-freedom flutter. Thus, aeroelastic tailoring may lead to aeroelastic behavior characteristics not unlike those of swept forward wings. Tailoring may improve controllability at reduced cost. It may provide increased effectiveness of active control by creating a harmonious control/structure environment. ESA

**LONGITUDINAL STABILITY AND CONTROL DERIVATIVES OBTAINED FROM FLIGHT DATA OF A PA-30 AIRCRAFT Final Report**
D. R. TURLEY and D. R. SANDLIN Apr. 1981 60 p
(Contract NCC4-1)
(NASA-CR-176999; NAS 1.26:176999) Avail: NTIS HC A04/MF A01 CSCL 01C

In order to obtain reliable and accurate values of the stability and control derivatives, the Dryden Fligh Research Center (DFRC) developed a technique for extracting the derivatives from flight data. This technique is implemented by a set of FORTRAN computer programs that is based on a modified maximum likelihood estimator that uses the Newton-Raphson algorithm to perform the required minimization of the derivatives. Data was obtained with a PA-30, light twin-engine general aviation aircraft in zero, half, and full flap configuration in level unaccelerated flight with the landing gear retracted. The derivatives were plotted as functions of angle of attack using various graphical arrangements to show variations of wind tunnel and flight determined values at zero flap settings. Also, data was displayed to show the effects of flap deflection and thrust variation on the longitudinal stability derivatives. The angle of attack and angle of sideslip were measured. The dynamic pressure, velocity, and altitude were calculated, using a FORTRAN computer program, from the static and dynamic pressures. The control deflections of the stabilator, ailerons, and rudder also were recorded along with left throttle position, engine rpm, and manifold pressure. B.G.

**A SURVEY OF HANDLING QUALITIES CRITERIA AND THEIR APPLICATIONS TO HIGH PERFORMANCE AIRCRAFT Final Report**
D. L. PEAHL, F. KOLKAILAH, and D. R. SANDLIN Jan. 1986 68 p
(Contract NCC2-338)
(NASA-CR-179654; NAS 1.26:179654) Avail: NTIS HC A04/MF A01 CSCL 01C

Various handling qualities criteria and their application to high performance aircraft including state-of-the-art and highly augmented aircraft were surveyed. Neal-Smith, Bandwidth, Equivalent Systems, and Military Specification 8785 criteria are applied to flight test data from aircraft such as the F-8 Digital Fly-By-Wire, the YF-12, and an Advanced Fighter Aircraft. Backgrounds and example applications of each criteria are given. The results show that the handling qualities criteria investigated can be applied to highly augmented aircraft with fairly good results in most cases; however, since no one method excelled, more than one criteria should be used whenever possible. Equivalent time delays appear to be the most frequent critical factor in determining pilot rating levels of highly augmented aircraft. Author

### LANDING GEAR TEST FACILITIES EXAMINED

J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, June 1986, p. 21-26.

The technology of landing-gear testing in the U.S. is reviewed. Consideration is given to roadwheel and table dynamometers for roll, dynamic-torque, and vibration tests; drop towers to test shock-absorption characteristics; and the full-scale takeoff and landing simulation apparatus at the NASA Langley Aircraft Landing Dynamics Facility (ALDF). The ALDF equipment, including a 100,000-lb test carriage with a 40 x 20-ft mounting bay, a propulsion system providing 2 x 10 to the 6th lb thrust, a 2800-ft test track with different road surfaces and water/ice/slush coverage, and facilities for a wide range of specific hardware tests, is described and illustrated with photographs. T.K.

### FLIGHT SIMULATION

R. N. HABER (Illinois, University, Chicago) Scientific American (ISSN 0036-8733), vol. 255, July 1986, p. 96-103.

The technology of flight simulation has undergone great advances since the Link trainer of World War II vintage. The skills that crew members of today's advanced aircraft must have to accomplish their missions may be acquired and sharpened aboard actual aircraft, but this is often difficult, time-consuming, expensive and dangerous. The use of simulators overcomes all of these disadvantages. A flight simulator consists of a cockpit and a control room; the cockpit is enclosed by a projection surface (either a series of cathode ray tubes or a number of projection screens) to show the trainee the panorama that would be visible from the aircraft in flight. Motion is simulated, instrument readings change, and the displayed view changes all in accordance with actions taken by the pilot and with problem inputs initiated by an instructor pilot. Problems of achieving great realism (visual resolution, 3-D effect, scope of the display) are noted. A recent innovation, the heads-up helmet-mounted display, is getting considerable attention. Numerous emergencies, weather changes, and combat situations can be created in rapid sequence to challenge the trainee to respond correctly. It is noted that in combat, if a pilot successfully accomplishes five missions the odds are better than 95 percent that he will survive all his future missions; it appears that many lives could be saved if the equivalent of those first five missions could be 'flown' on simulators. D.H.

### PROPELLER-INDUCED STRUCTURE-BORNE NOISE LABORATORY-BASED TEST APPARATUS

J. F. UNRUH (Southwest Research Institute, San Antonio, TX) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs

(Contract NAS1-17921)

(AIAA PAPER 86-1938)

A potentially important source of structure-borne interior noise transmission in advanced turboprop aircraft is the impingement of the propeller wake/vortex on downstream aerodynamic surfaces. The expected levels of propeller wake/vortex-induced structure-borne noise transmission are not known nor can they be determined with present-day technology. A test apparatus has been designed, built and calibrated for the purposes of studying propeller-induced, structure-borne noise transmission in prototypical aircraft structures. The principal approach to the test apparatus design was to provide a physical means of separating the airborne and structure-borne noise components so that the structure-borne noise transmission response could be studied directly without airborne noise contamination. This was accomplished by housing the receiving fuselage structure in an acoustic shield fitted with a wing-to-fuselage acoustic seal. Initial evaluation of the wing-to-fuselage acoustic seal indicates adequate airborne noise isolation to allow direct study of structure-borne noise transmission. Author

### ARNOLD ENGINEERING DEVELOPMENT CENTER - SIMULATORS ENCOMPASS SPECTRUM OF AEROSPACE ENVIRONMENTS

Aviation Week and Space Technology (ISSN 0005-2175), vol. 125, July 7, 1986, p. 59, 64, 69, 73.

The types, capabilities and applications of the aerospace simulation facilities at Arnold Engineering Development Center (AEDC) are outlined. The hardware inventory covers 11 turbine and rocket test cells, four high speed wind tunnels, four ballistic and impact ranges, and one supersonic and three transonic wind tunnels. AEDC is operated by contractors working closely with Air Force R&D personnel. Efforts are continuously expended to project generic requirements and prepare for future developments in aeromechanics, propulsion, space and reentry vehicle technologies. Testing is underway to identify technologies which meet the needs of efficient engines for vectored thrust aircraft, high altitude liquid-fueled rocket engines, orbit transfer vehicles, simulation of the environment for the national aerospace plane, and the effects of collisions betweeen birds and aircraft. Upgrades to the supersonic wind tunnel facility are described, along with recent flight dynamics accomplishments for military programs. M.S.K.

**A86-45674**

### ARNOLD ENGINEERING DEVELOPMENT CENTER - NEW FACILITY TO ASSESS ENGINE-AIRFRAME COMPATIBILITY PRIOR TO FIRST FLIGHT

Aviation Week and Space Technology (ISSN 0005-2175), vol. 125, July 7, 1986, p. 74, 75, 77.

Design and projected performance features of the Aeropropulsion Systems Test Facility (ASTF) at the Arnold Engineering Development Center are summarized. Built to simulate flight speeds up to Mach 3.8 and altitudes to 100,000 ft, the Facility is to meet national test requirements for airflow, simulated airspeed, thrust, altitude, and air temperature in its performance envelope into the 21st century. The test cells are each 28 ft in diameter and 85 ft long, with a total of 2170 data channels. Vehicles in a test cell are operated with controls similar to those in aircraft and feedback data are provided in real time. The capability is also available for testing engines over all transient states in a flight trajectory, rather than varying the conditions from one steady state to another. A primary goal in the development of the $600 million facility is to discover design flaws early in the development process and thus recoup the costs of the ASTF within a short number of years. M.S.K.

### REQUIREMENTS AND RECOMMENDATIONS FOR THE DEVELOPMENT OF THEORETICAL CODES AND EXPERIMENTAL FACILITIES IN THE NEAR FUTURE

B. COSTES (ONERA, Chatillon-sous-Bagneux, France) (Institut von Karman de Dynamique des Fluides, Cours, Brussels, Belgium, Athens, Greece, and Ankara, Turkey, Feb. 17-28, 1986) ONERA, TP, no. 1986-10, 1986, 16 p. refs
(ONERA, TP NO. 1986-10)

The development of computational fluid mechanics (CFM) techniques and facilities and complementary wind-tunnel facilities is projected over the period 1985-2000, summarizing the findings of a number of published reviews and reports. The strength, limitations, and inconsistencies of current CFM programs are surveyed; the need for greater reliability and for more cooperation among research teams and between basic science and industry is stressed; the reasons for continuing and improved wind-tunnel verification of CFM results are outlined; the advantages of current advanced-design wind tunnels (such as ONERA F2, NASA National Transonic Facility, DFVLR cryogenic tunnel, and some adaptive-wall facilities) are considered; and the need for better flow-visualization techniques is indicated. Diagrams, drawings, and graphs of sample data are provided. T.K.

**A86-46719**

### PROBLEMS OF THE VISUAL DISPLAY IN FLIGHT SIMULATION

R. E. CLAPP (Boeing Military Airplane Co., Wichita, KS) IN: Image quality: An overview; Proceedings of the Meeting, Arlington, VA, April 9, 10, 1985 . Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1985, p. 64-70. refs

The visual display presents a major source of critical information to the pilot in a flight training simulator. At the same time, due to underspecification or underdesign of the visual display system, the information presented to the pilot is grossly incomplete. These problems in the visual display are the result of misapplication or misunderstanding of the pilots visual perceptions and the limitations of resolution and scene detail of the visual display. This paper presents a summary of the principles of limiting resolution and the definition of scene detail, as well as a discussion of other visual parameters; and the importance of these factors in obtaining satisfactory standards in initial and continuation training in a flight simulator. Author

### DIGITAL DATA ACQUISITION SYSTEM FOR MODAL TESTING

D. BANASZAK and R. D. TALMADGE (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 1 . Schenectady, NY, Union College, 1985, p. 108-116. refs

The instrumentation system for ground vibration testing (GVT) of a F-16 aircraft is examined. The GVT system provides the multiple accelerometer and force signal measurements for aircraft modal analyses. The instrumentation system is composed of 120 piezoelectric accelerometers with FET followers, 120 six pole low-pass-filters, 120 automatic gas-changing amplifiers, a digital multiplexer, and a programable data acquisition system (DAS). The configuration and functions of the equipment are described. The evaluation and calibration of the DAS are discussed. I.F.

**A86-47127**

### PROPELLER FOD QUALIFICATION USING MODAL ANALYSIS, ARTIFICIAL BIRDS, AND A STATIC IMPACT FACILITY

M. L. DRAKE and R. S. BERTKE (Dayton, University, OH) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 2 . Schenectady, NY, Union College, 1985, p. 1072-1081. refs

The results of a program to investigate the impact response of a composite propeller blade to bird impacts are discussed. The program consisted of four major tasks, each of which is described in detail. The first task consisted of establishing the blade station in the spanwise direction which would cause the most severe structural response for the first three modes of the propeller. The second and third tasks consisted of impact tests of either 4 or 1.5 lb artificial birds to determine the structural and local response of the propeller blades. The fourth task consisted of determining the damage generated and documenting the damage. Rap testing indicated that the tip area would produce the maximum structural response. C.D.

### CRYOGENIC WIND TUNNELS FOR HIGH REYNOLDS NUMBER TESTING

P. L. LAWING, R. A. KILGORE, and P. D. MCGUIRE May 1986 95 p
(NASA-TM-87743; NAS 1.15:87743) Avail: NTIS HC A05/MF A01 CSCL 14B

A compilation of lectures presented at various Universities over a span of several years is discussed. A central theme of these lectures has been to present the research facility in terms of the service it provides to, and its potential effect on, the entire community, rather than just the research community. This theme is preserved in this paper which deals with the cryogenic transonic wind tunnels at Langley Research Center. Transonic aerodynamics is a focus both because of its crucial role in determining the success of aeronautical systems and because cryogenic wind tunnels are especially applicable to the transonics problem. The paper also provides historical perspective and technical background for cryogenic tunnels, culminating in a brief review of cryogenic wind tunnel projects around the world. An appendix is included to provide up to date information on testing techniques that have been developed for the cryogenic tunnels at Langley Research Center. In order to be as inclusive and as current as possible, the appendix is less formal than the main body of the paper. It is anticipated that this paper will be of particular value to the technical layman who is inquisitive as to the value of, and need for, cryogneic tunnels. Author

### SIMULATION OF AIRCRAFT TAXI TESTING ON THE AGILE SHAKER TEST FACILITY

R. FREYMANN and W. P. JOHNSON (Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio) *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 468-476 1985
Avail: NTIS HC A99/MF E03

Use of the Aircraft Ground Induced Loads Excitation test facility, an array of three independent shakers which allows laboratory simulation of an aircraft taxiing on rough surfaces, in the dynamic qualification process and for verification of the mathematical structural model of an aircraft is described. Experimental determination of the elastomechanical characteristics of aircraft landing gears and tires is outlined. ESA

### DIGITAL CONTROL LOADING AND MOTION - THE FINAL WORD?

J. COOPER, M. RUTHERFORD, and M. MCKINNON (CAE Electronics, Ltd., Montreal, Canada) ICAO Bulletin, vol. 41, May 1986, p. 30-33.

Attention is given to a novel flight simulator loading control and motion system which yields considerable logistics and performance benefits as well as dynamic flight simulations that are superior to those of modern analog systems. A 3-kHz iteration rate allows the modeling of nonlinear characteristics which are difficult to reproduce cost-effectively in the case of an analog model. Attention is given to the characteristics of the general control-loading model, the overall system's configuration, the sophisticated mechanical design employed, and safety considerations. O.C.

### RECONSTRUCTION OF FORCING FUNCTIONS BASED ON MEASURED STRUCTURAL RESPONSES

H. OERY, H. GLASER, and D. HOLZDEPPE *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 656-668 1985 Sponsored by Deutsche Forschungsgemeinschaft, ESA, and MBB/Erno G.m.b.H.

Avail: NTIS HC A99/MF E03

A structural analysis procedure to reconstruct the significant parts of the forcing function time-histories based on a restricted number of test records is presented. Use of the inverse application of the phase-plane method and Williams' method is proposed. The procedure is based on the fact that very slowly varying loads induce deformations, which can be determined using the stiffness matrix only. It can be applied to aerospace structures and to earthquake engineering. ESA

### INVESTIGATION OF THE IGNITION CHARACTERISTICS OF HYDROGEN/AIR MIXTURES IN THE CASE OF COMBUSTION INDUCED BY OBLIQUE SHOCKS [UNTERSUCHUNG DES ZUENDVERHALTENS VON WASERSTOFF/LUFT-GEMISCHEN BEI SCHRAEGSTOSSINDUZIERTER VERBRENNUNG]

J. ALGERMISSEN (Stuttgart, Universitaet, West Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 10, Mar.-Apr. 1986, p. 73-81. In German. refs
(Contract DFG-SFB-85)

Questions regarding the combustion induced by oblique shocks are of interest in connection with the development of new types of propulsion systems for the hypersonic flight in the atmosphere. The idea of a utilization of atmospheric oxygen as oxidizer in the case of hypersonic flight vehicles, has led to the concept of a 'scramjet'. The propulsion system envisaged provides for the flight Mach number range above four to six the optimum specific impulse with respect to all chemical propulsion systems. This system represents the theoretically best solution also on the basis of other considerations. A promising approach in studies for the technological implementation of the theoretical concepts is related to the utilization of supersonic flows with adaptable oblique shock ignition systems. An experimental installation for the study of supersonic combustion processes is discussed. The installation provides a steady free-jet flame, which is uniformly ignited over the entire cross section. G.R.

### CARBON RESIDUE STUDIES WITH A MICROCARBON RESIDUE TESTER

W. BOCHARTZ (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) ASLE, Annual Meeting, 41st, Toronto, Canada, May 12-15, 1986. 6 p. refs
(ASLE PREPRINT 86-AM-7A-1)

A test procedure for coking propensity of gas turbine lubricants was developed using a commercial microcarbon residue tester (MCRT) used for the American Society of Testing and Materials Test Method D-4530, 'Standard Test Method for Micro Carbon Residue of Petroleum Products'. The MCRT, a microprocessor-controlled heating unit, was evaluated for its ability to determine carbon residue in weight percent of synthetic gas turbine lubricants under controlled static conditions. The purpose was to obtain information on the amount of deposit remaining in glass vials after a measured volume of lubricant had been exposed to different degrading environments, varying the parameters of temperature, gas (air or nitrogen), and exposure time. During a test, several processes occur simultaneously. The major effect is volatilization of the lubricant. Substantial oxidation and thermal degradation of the lubricant also occur, causing residue to form in the glass vials. A criterion for evaluating the test lubricants is the weight of the vial deposits. The basic studies were conducted with four lubricants meeting MIL-L-7808J specification and two lubricants meeting MIL-L-23699C specification. The evaluation shows that the MCRT has potential use as a cost-effective laboratory tester to differentiate lubricants regarding tendency to form coke deposits prior to engine tests. Comparison of test data from the MCRT and the static coker deposition tester indicates that the tests have a good correlation, which is most likely due to the similar test conditions. Author

### THE NEED FOR RAPIDLY SOLIDIFIED POWDER METALLURGY ALUMINUM ALLOYS FOR AEROSPACE APPLICATIONS

W. E. QUIST (Boeing Commercial Airplane Co., Seattle, WA) and R. E. LEWIS (Lockheed Research Laboratories, Palo Alto, CA) IN: Rapidly solidified powder aluminum alloys; Proceedings of the Symposium, Philadelphia, PA, April 4, 5, 1984 . Philadelphia, PA, American Society for Testing and Materials, 1986, p. 7-37; Discussion, p. 37, 38. refs

A need exists within the aerospace industry for the engineering properties promised by aluminum alloys produced by rapid solidification technology (RST). The extent to which these alloys will achieve technical and commercial success depends, however, upon: (1) achievement of the engineering property goals, (2) the degree of success in the development of competitive materials, including other aluminum products, and (3) the economics of using such alloys for any given application, including the total production, fabrication, and life cycle costs for the material. Useful applications of the new RST aluminum alloys are envisioned for each of the three primary groups of aerospace vehicles: aircraft, missiles, and space vehicles. Each of these groups has a different general set of material property and cost objectives. The current powder metallurgy (PM) aluminum alloy development efforts for aerospace applications can be divided conveniently into three categories or classes of alloys: (1) high-strength, corrosion-resistant alloys; (2) low-density, high-modulus alloys; and (3) elevated-temperature, creep-resistant alloys. The development objectives for each of these alloy categories depend on the specific needs of the aerospace market for that category. The current status of progress in the development of the RST aluminum alloys indicates that some technical and economic success will be achieved in each category. The extent of this success is yet to be established. An assessment of various factors that affect the future course of development for these materials is presented. Author

**DEVELOPMENTS IN PREMIUM HIGH-STRENGTH POWDER METALLURGY ALLOYS BY KAISER ALUMINUM**
S. W. PING (Kaiser Aluminum and Chemical Corp., Pleasanton, CA) IN: Rapidly solidified powder aluminum alloys; Proceedings of the Symposium, Philadelphia, PA, April 4, 5, 1984 . Philadelphia, PA, American Society for Testing and Materials, 1986, p. 369-380. refs

The development of PM alloys from 1953-1983 is discussed. The initial formation of high-modulus, high-temperature alloys, alloy supersaturation studies on binary, ternary, and more complex alloys, and the fabrication of PM processed extrusions with good room-temperature properties are considered. The use of the depurative/vacuum degassing technique to form the PM alloys is described. The development of 7XXX- and 2XXX-based PM alloys with increased minimum strength levels is studied. The properties of the Al-Zn-Cu-Mg-Zr-Cr-Co (PM 64) alloy applicable for aircraft development are examined. Studies were conducted from 1981-1983 to modify the PM 64 alloy in order to improve its fatigue crack growth resistance. I.F.

**PROCEEDINGS OF FUEL SAFETY WORKSHOP**
31 Dec. 1985 382 p Workshop held in Alexandria, Va., 29 Oct. - 1 Nov. 1985 Prepared in cooperation with Analysis Group, Inc., Washington, D.C.
(DOT/FAA/PM-86/13) Avail: NTIS HC A17/MF A01 CSCL 21D

The workshop served a four-fold purpose: (1) to discuss the results of the Federal Aviation Administration/NASA Controlled Impact Demonstration (CID) conducted December 1984 at Edwards Air Force Base, California; (2) to explore potential approaches to preventing post-crash aircraft fuel fires, including possible combinations of various approaches; (3) to re-evaluate past approaches in terms of current technology; and (4) to propose a course of action for future industry/government research, especially any future FAA research and development program. These proceedings contain the formal conference presentations followed by the recommendations of the attendees as agreed upon in the three informal working breakout sessions.

**AMK FULL-SCALE TRANSPORT AIRCRAFT VALIDATION PHASE SUMMARY**
B. C. FENTON *In its* Proceedings of Fuel Safety Workshop p 61-114 31 Dec. 1985
Avail: NTIS HC A17/MF A01 CSCL 21D

Fuel system modifications for CV-880 and B-720 aircraft were designed, built, and flight/crash tested in a controlled impact demonstration (CID),in order to assess the feasibility of antimisting kerosene (AMK) in fire retardation. Central to the fuel system modification was the degrader design. The inline blending of AMK at fueling point demonstrated consistently high fuel quality. The degrader demonstrated successful flight operation, and engine performance under degraded AMK was comparable to performance with jet A under nominal flight conditions. It is concluded that transport aircraft can operate on AMK with minor modifications, although there are accident scenarios where AMK may not prevent a fuel spill fireball attachment to the wing/fuselage. J.P.B.

**POST CONTROLLED IMPACT DEMONSTRATION (CID) ANALYSIS**
W. T. WESTFIELD *In its* Proceedings of Fuel Safety Workshop p 115-135 31 Dec. 1985
Avail: NTIS HC A17/MF A01 CSCL 21D

The unplanned deviations in a Controlled Impact Demonstration (CID) to test an antimisting kerosene (AMK) are reported. Post-impact tests were conducted to assess the performance of the fire-retardant fuel; some of these tests were modified because of the deviations from the planned impact. The history of the planning of the CID is given. Experiments to explain the (often unexpected) behavior of the fuel on impact were conducted. It is concluded that the CID was not typical of accident impacts and that the antimisting fuel was exposed to circumstances which it was not designed to withstand. Even so, the antimisting fuel presented a less hostile environment through its slower vaporization and heat release. J.P.B.

Avail: NTIS HC A17/MF A01 CSCL 21D

Fuel containment research by the Federal Aviation Administration (FAA) is summarized. The objective is to make post-crash fires less fatal and injurious. Three types of aircraft (transport airplanes, rotorcraft, and general aviation airplanes) are addressed independently. Data presented include: (1) compilation of accident data generated by airplane manufacturers; (2) accident percentage versus major failure modes; (3) accident percentage versus fire and fatalities; (4) impact events which possess the highest fuel spill potential; (5) generic technical approach addressing fuel containment; and (6) sequence of events leading to design criteria to satisfy program objectives. **HEAT TRANSFER, FRICTION, AND RHEOLOGICAL CHARACTERISTICS OF ANTIMISTING KEROSENE**

E. MATTHYS and V. SAROHIA *In* FAA Proceedings of Fuel Safety Workshop p 181-183 31 Dec. 1985
(Contract NAS7-918; DTFA03-80-00215)
Avail: NTIS HC A17/MF A01 CSCL 21D

Experiments were performed to determine the skin friction and heat transfer behavior of antimisting kerosene (AMK) in pipe flows. The additive used was FM-9. Based on the results of the experiments, which identify high viscosity and viscoelasticity for AMK, it is recommended that AMK be degraded. Sufficient degradation produces behavior similar to that of jet A. J.P.B.

**CONTINUOUS INLINE BLENDING OF ANTIMISTING KEROSENE**

P. PARIKH, A. YAVROUIAN, and V. SAROHIA *In* FAA Proceedings of Fuel Safety Workshop p 203-217 31 Dec. 1985
(Contract NAS7-917; DTFA03-80-A-00215)
Avail: NTIS HC A17/MF A01 CSCL 21D

A continuous inline blender was developed to blend polymer slurries with a stream of jet A fuel. The viscosity of the slurries ranged widely. The key element of the blender was a static mixer placed immediately downstream of the slurry injection point. A positive displacement gear pump for jet A was employed, and a progressive cavity rotary screw pump was used for slurry pumping. Turbine flow meters were employed for jet A metering while the slurry flow rate was calibrated against the pressure drop in the injection tube. While using one of the FM-9 variant slurries, a provision was made for a time delay between the addition of slurry and the addition of amine sequentially into the jet A stream. J.P.B.

**SAFETY FUELS-SPECIFICATIONS AND PROGRESS**

A. T. PEACOCK *In* FAA Proceedings Fuel Safety Workshop p 255-260 31 Dec. 1985
Avail: NTIS HC A17/MF A01 CSCL 21D

This paper discusses fuel standardization and quality control and the mechanisms already in place to attain them. It reflects 20 years of development of safety fuels and considers where the Federal Aviation Administration (FAA) should go from here. The need for a standard technical description of aviation turbine fuels that are developed to enhance fuel safety is discussed. Fuel property descriptions, test methods, and standardization procedures are also discussed, along with approvals for additives and fuel quality control. The role of the American Society for Testing and Materials (ASTM) in standardization is outlined, and a short history of safety fuels is given. It is suggested that fuel modification should not be abandoned as a method of improving safety. Author

The research resulting in a process for dissolving polyisobutylene (PIB) in antimisting fuel is described. Reasons for continued private industry research into antimisting fuel are outlined. The background of investigations of the relationship between high molecular weight polymer additives, droplet size, and mist-induced fires is reported. The promise of PIB in antimisting fuels is summarized on the basis of theses characteristics: (1) satisfactory effectiveness at very low concentrations; (2) satisfactory effectiveness under high shear forces; (3) compatibility with current fuel specifications and unmodified fuel systems; (4) low cost under current high volume production; (5) ease of handling and application; and (6) elimination of catastrophic fuel explosions. J.P.B.

**ANTIMISTING KEROSENE: EVALUATION OF IMPROVED FM-9 ADDITIVE Final Report, Aug. 1983 - Nov. 1984**

A. YAVROUIAN, P. PARIKH, and V. SAROHIA Jun. 1986 51 p
(Contract DTFA3-80-A-00215)
(DOT/FAA/CT-85-4; JPL-D-2581) Avail: NTIS HC A04/MF A01

During the past few years, studies by the Federal Aviation Administration (FAA) and other government agencies have shown that the hazards from aircraft crash fires might be significantly decreased if an antimisting kerosene (AMK) fuel could be utilized. The addition of polymeric additive at low concentrations to jet fuels is known to suppress mist formation and ignition of the fuels under circumstances often encountered in survivable aircraft crash landings. An antimisting additive, FM-9 (Trademark) has been developed by Imperial Chemical Industries (ICI) and is available under the trade name AVGARD. This material when dissolved in jet fuels imparts a strong time-dependent threshold type shear-thickening behavior. In case of fuel spillage from a ruptured fuel tank during an aircraft crash, the fuel misting is prevented. Simulated aircraft crash landing fuel spillage tests have indicated that fuel misting can be sufficiently suppressed, and the ignition and the subsequent fireball formation can be greatly reduced or eliminated. Optimization of FM-9 dissolution rate to attain acceptable mist suppression and degradation properties within 15 to 20 minutes of inline blending was carried out by ICI. This report discusses the evaluation of FM-9 variant which has better dissolution rate and consequently better degradability and compatibility with engine filters and fuel control system and was identified as a candidate additive to be used in a Control Impact Demonstration (CID) test. **FLIGHT SERVICE EVALUATION OF COMPOSITE COMPONENTS ON THE BELL HELICOPTER MODEL 206L Annual Flight Service Technical Summary Report**

H. E. WILSON, II Aug. 1986 53 p
(Contract NAS1-15279)
(NASA-CR-178148; NAS 1.26:178148; AFSR-2) Avail: NTIS HC A04/MF A01 CSCL 11D

This is the second annual report on the flight service components for the Bell Model 206L JetRanger helicopter. The components have been placed in service in the Continental United States, Canada, and Alaska. The report covers the period from 1 August 1983 to 1 January 1986. The status of 34 sets of components is discussed in this report. Approximately 73,000 flight hours were accumulated on the components as of 1 January 1986. Three years of coupon tests on the components are presented with test results. A vertical fin had been struck by lightning and the results of its examination and tests are included. Author

**THE USE OF A PYROCHEMILUMINESCENT NITROGEN ANALYZER AS A CAPILLARY GC (GAS CHROMATOGRAPH) DETECTOR Final Report, Mar. - May 1985**
E. W. PITZER Feb. 1986 21 p
(AD-A166597; AFWAL-TR-85-2077) Avail: NTIS HC A02/MF A01 CSCL 07D

A study was conducted to determine the feasibility of interfacing a pyrochemiluminescent nitrogen analyzer to a high resolution glass capillary gas chromatograph. The instruments used were a Varian Model 3700 gas chromatograph and an Antek Model 703C pyrochemiluminescent nitrogen analyzer. Known standards of nitrogen containing compounds were prepared in shale derived jet propulsion fuel that had been previously determined to have no nitrogen containing species. These solutions were then chromatographed on the GC/CLD system. The resulting data were reduced using relative response factors with an internal standard. The nitrogen content of the standard solutions were validated by analyses on a separate Antek nitrogen analyzer used to determine total nitrogen content. The method of GC/CLD was deemed feasible. However, it is recommended that appropriate design changes be made to the Antek Model 703C nitrogen analyzer to accommodate the type of flows common with capillary gas chromatographs. GRA

**ANTIMISTING FUEL RESEARCH AND DEVELOPMENT FOR COMMERCIAL AIRCRAFT Final Report**
M. YAFFEE Apr. 1986 78 p
(FAA/CT-86/7) Avail: NTIS HC A05/MF A01

This report covers the research, development, testing, and evaluation conducted by the Federal Aviation Administration (FAA) in pursuit of an effective, feasible antimisting agent for kerosene jet fuels that would prevent or reduce the dangers of postcrash, fuel mist fires. For the past eight years, most of this effort was focused on a high molecular weight polymer, FM-9 (Trademark), as a representative agent to prove the antimisting fuel concept. The results of this work indicate that the goal is achievable: Jet fuel can be modified to provide a significant degree of protection against postcrash fires in impact-survivable accidents. Additional development and testing would be required before the fuel is operationally acceptable. It would be necessary to make some modifications in fuel handling procedures and hardware in aircraft and at airports. But there appear to be no technically insurmountable problems. Author

**STABILITY ANALYSIS OF COMPOSITE STIFFENED LAYER PLATES UNDER COMPRESSION**
X. TONG (Aircraft Structural Strength Research Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, Feb. 1986, p. 54-62. In Chinese, with abstract in English. refs

The stability of composite stiffened layer plates under axial compression is studied by analytical and finite strip element methods. Rational selection of the displacement functions is stressed and solutions are given for five different combinations of plate stiffness with load cases. By using the displacement expression chosen, the prediction of the critical stress could be performed with a computer program instead of the previous complex calculation. Therefore, it is clear in physical concept and easy to control the convergence process. A general-purpose computer program is developed for a stability analysis based on this method. Some typical cross-section configurations and composite stiffened layer plates with stiffeners have been calculated. The numerical results are in good agreement with the experimental data and the analytical solutions. Author

**SENSITIVITY ANALYSIS OF PARAMETERS IN SOLVING INVERSE PROBLEM OF STRUCTURAL DYNAMICS**

F. GAO (Aeronautical Computation Technique Institute, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 7, Feb. 1986, p. 108-113. In Chinese, with abstract in English. refs

A sensitivity analysis of parameters in solving the inverse problem of structural dynamics is presented using the perturbation theory. By introducing a set of variable parameters in the structure, the derivatives of structural natural frequencies and/or modes with respect to these parameters are obtained so as to determine the sensitive elements or locations of the structure. In the degenerated case with multiple eigenvalues, the sensitivities of the natural frequencies are obtained by means of Puiseux series and considered as the eigenvalues of the matrix. The method is easy to implement obtaining thus the automatization of the dynamic design for the structure. It has been applied to the vibration design of several beam frame structures in aeronautical engineering and has been verified by experimental data. Author

**AN ANALYSIS OF BENDING WAVE PROPAGATION ON IMPACT IN A ROTATING FAN BLADE**

T. SHIOYA (Tokyo, University, Japan) Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 34, April 1986, p. 195-198. In Japanese, with abstract in English. refs

This paper presents an theoretical analysis of the electric bending wave propagation in a rotating fan blade by the use of a simplified model. An impact of constant lateral force or constant moment is subject to a semi-infinite elastic beam at the end. Constant body force which represents the centrifugal force due to the rotation is acting parallel to the initial beam direction. The result of the analysis shows that a similar solution for the bending wave exists in case of no centrifugal force. The wave velocity and the moment are obtained in a simple form. The centrifugal force effects the decrease of the wave velocity and the amplitude of the bending moment. Author

**COMPUTER AIDED ENGINEERING IN STRUCTURAL DESIGN AND OPTIMIZATION**

B. FREDERIKSSON, J. BRANDT, and T. BRANA (SAAB-Scania AB, Linkoping, Sweden) IN: International FEM-Congress, 14th, Baden-Baden, West Germany, November 18, 19, 1985, Proceedings . Stuttgart, West Germany, IKOSS GmbH, 1985, p. 251, 253-266. refs

A systematic approach to the structural engineering design work is discussed. The use of the finite element internal loads models as a basis for the stress analysis and sizing work is presented. Software has been developed for automatic load and spectra generation. Local load sequences and spectra are generated based upon the result from the FE-analysis. This is then used for fatigue and fracture analysis of the structure components. In the design process it is important to find optimal solutions. Examples are minimization of structural weight or minimization of moment of inertia. Software has been developed for structural optimization. Examples on wing weight minimization and fin rudder moment of inertia minimization are discussed. Author

**DAMAGE TOLERANCE - USAF EXPERIENCE**

J. W. LINCOLN (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 265-295. refs

The damage tolerance experience on U.S. Air Force aircraft is traced from the F-111 in the early seventies to the present. The phases of the damage tolerance assessment are discussed by means of examples to highlignt important aspects of the process. The experience derived from the individual assessment is used to describe the lessons learned and to illustrate the evolution of structural criteria to be used for future USAF procurements. Author

**CONTINUING STRUCTURAL INTEGRITY PROGRAM FOR TRANSPORT AIRCRAFT**

P. R. ABELKIS, M. B. HARMON, and D. S. WARREN (Douglas Aircraft Co., Long Beach, CA) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 395-422. refs

Continuing structural integrity of commercial transport aircraft is provided by inspection programs established through the combined efforts of aircraft manufacturers, regulatory agencies, and aircraft operators. Criteria and guidelines have been established for the evaluation and supplementation, if necessary, of these inspection programs for older commercial transport aircraft. The evaluation is based on aircraft current usage, durability, and damage tolerance assessment of the structure using current analysis and testing technology and state-of-the-art inspection methods. A supplemental inspection program, when necessary, is based on statistical-probabilistic concepts of having and detecting damage-cracks and is implemented through a sampling program of the high-time aircraft. Author

**A86-43791**

**MAINTENANCE SYSTEM BY MEANS OF DAMAGE TOLERANCE PRINCIPLE**

K. H. GALDA (Deutsche Lufthansa AG, Hamburg, West Germany) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 473-494.

The maintenance of the structure of a civil jet transport aircraft is based on the damage tolerance principle. The inspection intervals and methods have to be determined such that a possible failure will most probably be detected before becoming critical. For new and old airplanes, the inspection system is based on the acceptable damage of the aircraft structure without a risk of a catastrophic failure. The application of the damage tolerance system includes all existing inspections geared toward more flexibility in planning and maintenance. Author

### A RATIONALE FOR THE SAFE OPERATION OF AN AIRCRAFT FLEET HAVING KNOWN CRACKS IN PRIMARY STRUCTURE

J. M. GRANDAGE (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 495-510. refs

This paper presents a rationale and procedure aimed at operating known-to-be-cracked structures at acceptable risk levels. Existing airworthiness requirements for design are referred to, and problems of applying these requirements to a fleet of cracked structures are discussed. This leads to an appropriate adaptation of the requirements. Author

**A86-43793**

### THE INFLUENCE OF SLOW GROWTH AND NET SECTION YIELDING ON THE RESIDUAL STRENGTH OF STIFFENED STRUCTURE

T. SWIFT (FAA, Long Beach, CA) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 511-550. refs

In order to limit detectable crack sizes used in the damage tolerance evaluation of commercial aircraft in compliance with FAR 25.571, the regulatory authorities have been considering a further requirement that the structure be capable of 95 percent ultimate load with cracking up to detectable length. From a fracture mechanics viewpoint this is not achievable with the current materials, design concepts and working stress levels. This paper discusses the authorities' concerns together with the difficulties encountered with such a requirement. Author

**A86-43794**

### FRACTURE DIAGRAMS FOR STIFFENED AIRCRAFT STRUCTURES - EFFECTS OF MATERIAL NON-LINEARITY

M. C. LOW (British Aerospace, PLC, Aircraft Group, Bristol, England) and D. J. CARTWRIGHT (Bucknell University, Lewisburg, PA) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 551-583. Research supported by British Aerospace, PLC. refs

The complex variable formulation of two-dimensional elasticity is used to analyze a crack with unequal strip yield zones in an asymmetrically stiffened sheet. The simultaneous effects of yielding in the fasteners and stiffeners are included in the analysis. The strip yield zone lengths, the crack tip opening displacements, the maximum load concentration in the stiffener and the maximum fastener force are determined for a typical aircraft stiffened panel. Fracture diagrams are constructed for the panel and are used to show the effects of panel geometry and fastener flexibility. Author

### A SIMPLE CRACK CLOSURE MODEL FOR PREDICTING FATIGUE CRACK GROWTH UNDER FLIGHT SIMULATION LOADING

D. ALIAGA, A. DAVY (Aerospatiale, Suresnes, France), and H. SCHAFF (Aerospatiale, Toulouse, France) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 605-630. refs

The model described is based on the crack closure concept. A rule which fixes changes in the opening point is used to take into account the effects of the stress ratio and the retardation effect. A conservative counting method, similar to the 'rain flow' technique, is applied to each cycle. The model therefore combines a cycle-by-cycle analysis with a conservative counting method. Other advantages of the approach are the facility with which the parameters used to represent the material can be determined, its reliability and its applicability to all metal alloys. Examples of its application to aluminum alloys and a steel are included. Author

### THE CERTIFICATION OF AIRFRAMES AND COMPONENTS IN METALS AND COMPOSITES

A. W. CARDRICK (Royal Aircraft Establishment, Airworthiness Div., Farnborough, England) IN: Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 . Warley, England, Engineering Materials Advisory Services, Ltd., 1985, p. 651-672. refs

The UK Military airworthiness authorities believe that aircraft should have a good fatigue life and tolerance to variations from the conditions used in design. The most serious variations are those which affect the entire fleet as is the case with increases in all up weight, new maneuvers, changes in stores carriage policies and wear in mechanical components. If the structure is unduly sensitive to any consequential elevated loads operational effectiveness will be impaired. A brief description is given of draft requirements for Defence Standard 00-970. It is intended that these requirements should be applied to aeroplanes and helicopters and to all structural materials including fiber composites. Author

**A86-43896**

### EXPERT SYSTEMS FOR MECHANICAL FAULT DIAGNOSIS

R. M. STEWART (Stewart Hughes, Ltd., Southampton, England) IN: AUTOTESTCON '85; Proceedings of the International Automatic Testing Conference, Uniondale, NY, October 22-24, 1985 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 295-300.

The interfacing of numerically intensive, imperative programs in expert systems for mechanical fault diagnosis is examined. The design of a Machinery Management Computer for helicopters is discussed as an example of such interfacing. The fundamentals of the interfacing problem are addressed, discussing an expert system for bearing diagnostics, the interface between imperative and declarative elements, and the problem of evidence accumulation. The potential benefits and problems of artificial intelligence and expert systems in the machinery management field are considered. C.D.

### HYPERSONIC VISCOUS SHOCK LAYER ON A SURFACE WITH AN ABRUPT VARIATION OF CATALYTIC ACTIVITY

E. A. GERSHBEIN, V. IU. KAZAKOV, and V. S. SHCHELIN (Moskovskii Gosudarstvennyi Universitet, Moscow, USSR) (Teplofizika Vysokikh Temperatur, vol. 23, Sept.-Oct. 1985, p. 916-921) High Temperature (ISSN 0018-151X), vol. 23, no. 5, March 1986, p. 727-732. Translation. refs

The flow of a multicomponent mixture of nonequilibrium-reacting gases over catalytic surfaces having an inset zone of materials with different catalytic properties is investigated within the framework of the theory of a hypersonic viscous shock layer on infinite-span wings with a blunt leading edge. Author

**A86-44801**

### FLOW OF REAL FLUIDS

G. E. A. MEIER, ED. and F. OBERMEIER, ED. (Max-Planck-Institut fuer Stroemungsforschung, Goettingen, West Germany) Berlin and New York, Springer-Verlag (Lecture Notes in Physics. Volume 235), 1985, 353 p. In English and German. For individual items see A86-44802 to A86-44813.

A survey is presented of recent advances in fundamental research into numerically modelling and experimentally observing and controlling various processes of interest in fluid mehanics. Studies on the effects of the compressibility of a flow on sound propagation are reported, including work with the reverse flow theorem for transonic flow and sound generation by airfoil-vortex interaction. Sound radiation from planes and cylinders into fluids and from turbomachinery and propellers is examined. Wave momentum and power balance in a boundary layer are investigated, along with the gas dynamics, heat, adiabatic phase transitions and wavesplitting in fluids with high specific heat. Consideration is also given to acoustic turbulence, models for slender vortex breakdown, and the vortical structure of bounded turbulent shear flow. M.S.K.

**A86-44934**

### STRUCTURAL MODIFICATION BY MODAL CORRECTION

D. M. WILSON (Council for Scientific and Industrial Research, National Institute for Aeronautics and Systems Technology, Pretoria, Republic of South Africa) Aeronautica Meridiana (ISSN 0257-8573), vol. 6, no. 1, 1985, p. 37-42.

In the interest of achieving cost reductions in the ground testing of vibration characteristics in such large structures as those of aircraft, attention is given to alternative methods of airframe structural modification. The method of modal correction involves the addition or subtraction of pylons, fuel tanks, etc., by theoretical means, thereby reducing vibration testing requirements. Theoretically predicted results compare well with experimental data, and show that the inclusion of stiffness modification improves predictions. O.C.

### AN ITERATIVE METHOD FOR STATICALLY INDETERMINATE STRUCTURES OF FLIGHT VEHICLE

O. MARTIN (Institutul National pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania) Revue Roumaine des Sciences Techniques, Serie de Mecanique Appliquee (ISSN 0035-4074), vol. 31, Jan.-Feb. 1986, p. 41-46.

Using the principles of the slope deflection method and matrix calculus, an iterative method is presented which allows the reactions in the attachment points of aircraft movable surfaces, the elevator, rudder and aileron, to be determined as a function of their displacement. A deflecting supporting structure loaded with air loads is also considered, and the individual effects of the load are summed using the superposition principle. R.R.

### A SYSTEM FOR INTRODUCING MUTUAL CORRECTIONS INTO THE AIRBORNE TEMPERATURE AND AIR-SPEED METERS [SISTEMA VVEDENIIA VZAIMNYKH POPRAVOK DLIA SAMOLETNYKH IZMERITELEI TEMPERATURY I SKOROSTI VOZDUSHNYKH POTOKOV]

V. K. DMITRIEV and M. A. STRUNIN IN: Methods and technology for experimental studies of the atmosphere . Moscow, Gidrometeoizdat, 1985, p. 104-112. In Russian.

A scheme for introducing mutual corrections into the airborne thermometer and pneumoanemometer data indicating the atmospheric temperature and airspeed, as well as fluctuations in the temperature and the horizontal airspeed component, is discussed. Error estimates for several temperature and altitude values have been calculated, and the restitution coefficient for the temperature detector has been determined. The results of flight tests are presented, along with a block diagram of the system. I.S.

### A QUASI-ONE-DIMENSIONAL MODEL FOR THE EVOLUTION OF THE TURBULENT WAKE OF A BODY IN A STRATIFIED MEDIUM [KVAZIODNOMERNAIA MODEL' EVOLIUTSII V STRATIFITSIROVANNOI SREDE TURBULENTNOI OBLASTI SLEDA ZA TELOM]

L. I. SKURIN (Leningradskii Gosudarstvennyi Universitet, Leningrad, USSR) Akademiia Nauk SSSR, Izvestiia, Fizika Atmosfery i Okeana (ISSN 0002-3515), vol. 22, April 1986, p. 373-379. In Russian. refs

The time dependence of the sizes of plane turbulent spots in a stratified medium is described. The plane turbulent spots are studied under conditions where the pulsation Froude number values are large and the volume increases in the region considered due to turbulent diffusion is substantial. A system of equations for the evolution of such spots in a quasi-one-dimensional approximation is derived, and conditions under which the viscous stage of evolution occurs are established. The evolution of the turbulent wake of a hypersonic vehicle is considered. I.F.

### FATIGUE LIFE ANALYSIS OF A TURBOPROP REDUCTION GEARBOX

D. G. LEWICKI, J. J. COY (NASA, Lewis Research Center; U.S Army, Propulsion Laboratory, Cleveland, OH), J. D. BLACK (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN), and M. SAVAGE (Akron, University, OH) ASME, Transactions, Journal of Mechanisms, Transmission, and Automation in Design, vol. 108, June 1986, p. 255-262. Previously announced in STAR as N85-27228. refs

(ASME PAPER 85-DET-10)

A fatigue life analysis of the Allison T56/501 turboprop reduction gearbox was developed. The life and reliability of the gearbox was based on the lives and reliabilities of the main power train bearings and gears. The bearing and gear lives were determined using the Lundberg-Palmgren theory and a mission profile. The five planet bearing set had the shortest calculated life among the various gearbox components, which agreed with field experience where the planet bearing had the greatest incidences of failure. The analytical predictions of relative lives among the various bearings were in reasonable agreement with field experience. The predicted gearbox life was in excellent agreement with field data when the material life adjustment factors alone were used. The gearbox had a lower predicted life in comparison with field data when no life adjustment factors were used or when lubrication life adjustment factors were used either alone or in combination with the material factors. Author

### CALCULATION OF THE EXPLOSION OF A RAPIDLY FLYING BODY [K RASCHETU VZRYVA BYSTRO LETIASHCHEGO TELA]

L. V. SHURSHALOV Zhurnal Vychislitel'noi Matematiki i Matematicheskoi Fiziki (ISSN 0044-4669), vol. 26, June 1986, p. 924-933. In Russian. refs

The paper formulates the problem of the explosion of a rapidly flying body, considered as a spherical gas volume characterized by high explosion energy and a high translational velocity. An algorithm for solving the problem is proposed which, together with the conventional divergent system of gasdynamic equations, uses nondivergent equations for the kinetic and internal energy of the gas, and a difference grid moving with the exploding body. Attention is given to cases of the explosion of gas volumes moving at velocities corresponding to M = 3 and M = 30. B.J.

### RESPONSE OF SYMMETRIC RECTANGULAR COMPOSITE LAMINATES WITH NONLINEAR DAMPING SUBJECTED TO ACOUSTIC LOADING

C. MEI (Old Dominion University, Norfolk, VA) and C. B. PRASAD AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 16 p. refs

(Contract NAS1-17993)

(AIAA PAPER 86-1933)

Effects of both nonlinear damping and large-deflection are included in the analysis in an attempt to explain the experimental phenomena of aircraft panels excited at high sound pressure levels; that is the broadening and flattening out of the strain response peaks and the increasing of the response frequency. A nonlinear damping model is considered in the analysis using a single-mode approach. Root-mean-square (RMS) maximum deflection, RMS strains, spectral density functions of strain, and equivalent linear frequency are obtained for clamped and simply supported rectangular symmetric laminated composite plates. It is demonstrated that nonlinear damping is the one which causes the broadening of the response peaks, and it has great influence on RMS panel deflection, RMS strains, and frequency. Author

### THE PRESSURE FIELD GENERATED BY JET-JET IMPINGEMENT

N. S. NOSSEIR and U. PELED (San Diego State University, CA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 7 p. refs
(Contract N00014-84-K-0373)
(AIAA PAPER 86-1951)

The impingement of two, axisymmetric turbulent jets on each other is investigated experimentally. The angle of impingement is equal to 180 deg, and the jets issue from large flat plates. Characteristics of the flowfield and pressure disturbances generated in the impinging region and amplified by feedback mechanisms are discussed. Author

### EXPERIMENTAL INVESTIGATION OF UNSTEADY FAN FLOW INTERACTION WITH DOWNSTREAM STRUTS

W. F. NG, W. F. OBRIEN, and T. L. OLSEN (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p. NASA-supported research. refs
(AIAA PAPER 86-1870)

In the present study of the unsteady pressure field produced on fan rotor blades by interaction with downstream struts, a single stage, low speed axial-flow fan was instrumented with blade-mounted high frequency pressure transducers. In addition, stationary pressure problems were used to map out the flowfield. Fluctuating pressure measurements are presented for blade midspan and 85-percent span on both the suction and pressure surfaces of the rotor blades at several positions of the downstream struts, and for two different flow coefficients. The strut is found to produce an effect on the unsteady pressure field on the rotor blades; this effect exceeds that due to the stator at design rotor-stator-strut spacing, but it rapidly declines as the struts are moved downstream. O.C.

**A86-45694**

### THE VIBRATION AND STABILITY OF SYMMETRICALLY-LAMINATED COMPOSITE RECTANGULAR PLATES SUBJECTED TO IN-PLANE STRESSES

D. J. DAWE (Birmingham, University, England) and T. J. CRAIG (VSEL Consortium, PLC, Dept. of Naval Architecture, Barrow-in-Furness, England) Composite Structures (ISSN 0263-8223), vol. 5, no. 4, 1986, p. 281-307. Research supported by the Royal Aircraft Establishment and SERC. refs

Consideration is given to the twin problems of the elastic buckling of rectangular, symmetrically-laminated composite plates and of the vibration in the presence of applied in-plane stress of such laminates. First-order shear deformation plate theory provides the mathematical model of plate behavior and the Rayleigh-Ritz and finite strip methods are used to generate numerical results for laminates of thin and moderately thick geometry, with various combinations of standard plate edge conditions. The applied stresses include uniform shear stress as well as direct stresses, and anisotropic material properties can be included. The presented results demonstrate the accuracy of the numerical methods and highlight the very significant influence that transverse shear and related thickness effects can have in the subject problems.

### OPTIMIZATION OF STIFFENED PANELS UNDER COMPRESSION

W. LI (Northwestern Polytechnical University, Xian, People's Republic of China) Journal of Strain Analysis for Engineering Design (ISSN 0309-3247), vol. 21, July 1986, p. 153-158. refs

The optimization of the angle-stiffened panel under compression using the feasible direction method is studied. Only the most critical constraint could be taken into account for each iteration when using the feasible direction method, with the result that the process of calculation is greatly simplified. It is beneficial for stability and convergence of the design process that the design variables in each iteration are modified once by some experience formulae, if necessary. The illustrative examples and the comparison of the numerical results of this paper with those of another paper indicate the effectiveness and efficiency of the method presented here.

**A86-45816**

### PRECISION CASTING OF AERO GAS TURBINE COMPONENTS

G. A. WHITTAKER (G. A. Whittaker and Associates, Crewe, England) (Institute of Metals, Conference on Casting of Superalloys, London, England, Feb. 27, 1985) Materials Science and Technology (ISSN 0267-0836), vol. 2, May 1986, p. 436-441.

The development of techniques for the production of aircraft gas turbine components by precision casting is described. Various steps in the casting process are discussed, including conditions of the wax and core assembly and molding practices, dewaxing, mold firing, melting practice, core removal, and the cut-off and finishing. Attention is paid to quality failures and their remedies, with special consideration given to dimensional and grain size controls; the problems of shrinkage porosity, misruns, hot tears, and surface oxidation pitting; and the causes of mechanical failures. I.S.

**A86-46135**

### FIBER OPTIC SENSORS FOR FLEXURE MEASUREMENT OF AIRCRAFT STRUCTURES

R. C. MURPHY (Canadian Marconi Co., Montreal, Canada) Unmanned Systems, vol. 4, Spring 1986, p. 31-35. refs

An evaluation is made of the possible roles that fiber-optics technologies can play in constituting an EMI-immune, low-weight structural monitoring system for very long endurance aircraft (VLEA). The key to such systems is the obviation of the fiber-optic cabling's protective material, and the direct realization of sensor devices in glass fiber structures or integrated optics devices. Attention is given to passive multiplexing techniques, lens and modulator designs, the structure of fiber-optical EM field, structural strain and deflection sensors, and the instrumentation of a VLEA's wing structure. O.C.

### NEW LEVELS OF REALISM ACHIEVED IN VISUALS FOR FLIGHT SIMULATION

M. LONG (Rediffusion Simulation, Ltd., Crawley, England) ICAO Bulletin, vol. 41, May 1986, p. 28, 29.

Novoview SP1/T and SupraWIDE are visual simulation systems for aircrew training which respectively improve image texture and furnish wrap-around imagery. Both fixed wing and rotary wing flight simulations can be implemented with these systems. SupraWIDE employs a specially designed Schmidt projection system for its CRTs which incorporates reflective rather than refractive optics. Novoview SP1/T can realistically represent actual world airports under full lighting conditions, with surrounding environmental lights and such terrain features as mountains and three-dimensional buildings. O.C.

**A86-46562**

### SUPERALLOY COMPONENT DURABILITY ENHANCEMENTS

R. A. SPRAGUE (GE Engineering Materials Technology Laboratory, Evendale, OH and Lynn, MA) and S. J. FRIESEN (General Electric Co., Evendale, OH) Journal of Metals (ISSN 0148-6608), vol. 38, July 1986, p. 24-30. refs

This overview summarizes process improvements in wrought and cast superalloy components for turbine engine applications. Techniques such as VIM, VAR, ESR and electron beam melting are discussed with respect to product cleanliness. Property enhancement is now an important consideration of forging technology. Scientists are quantifying the dependence of crack growth on microstructure and alloy design. Directional solidification casting practices that promote integrity and property enhancement are achievable through careful process control. State-of-the-art developments and future directions for the industry are also reviewed. Author

**A86-46701**

### SENSITIVITY, NOISE AND OPTICAL CROSSTALK IN HETERODYNE ACOUSTO-OPTICAL SIGNAL PROCESSORS

T. S. CHEN (TRW Electro-Optics Research Center, Redondo Beach, CA) and S. K. YAO (TRE Semiconductor Equipment Corp., Woodland Hills, CA) IN: Optical technology for microwave applications II; Proceedings of the Meeting, Arlington, VA, April 9, 10, 1985 . Bellingham, WA, Society of Photo-Optical Instrumentation Engineers, 1985, p. 88-94.

The suggestion that optical scattering in a heterodyne acoustooptical system can be ignored, in view of a beat frequency with the reference beam that lies outside the IF bandpass of the heterodyne detection, is contradicted by the present analysis. Instead, a finite point-spread function convolving with the reference beam of a heterodyne spectrum analyzer causes a mixing of photons with different frequency shifts, thereby generating IF noise. The additional contribution of a signal beam with finite scattering level to optical cross-talk, through mixing with the scattered reference beam, is presently clarified by both analytical derivation and experimental data. O.C.

**A86-46788**

### IMPACT OF SUPERCOMPUTERS ON THE NEXT DECADE OF COMPUTATIONAL FLUID DYNAMICS

E. M. MURMAN (MIT, Cambridge, MA) and S. S. ABARBANEL (Tel Aviv University, Israel) IN: Progress and supercomputing in computational fluid dynamics; Proceedings of U.S.-Israel Workshop, Jerusalem, Israel, December 1984 . Boston, MA, Birkhaeuser, 1985, p. 1-10.

The current status of computational fluid dynamics is surveyed, and future trends are projected, with an emphasis on the application of supercomputers. It is predicted that supercomputer directly addressable high-speed memory capacity will increase from 2-16 to 256 Mwords and that processor speed will increase from 100 to 1000 MFLOPS over the next 10 yrs. The implications of these improvements for the exploratory design of aircraft, for treatment of unclean aerodynamic flows, for theoretical understanding of complex flow problems, for algorithms and languages, and for subsystem development are discussed. T.K.

**A86-47011**

### INCREMENTAL AND ITERATIVE METHODS FOR SOLVING FLUID/STRUCTURE INTERACTION PROBLEMS

Y. GONG (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) IN: Numerical methods in laminar and turbulent flow; Proceedings of the Fourth International Conference, Swansea, Wales, July 9-12, 1985. Part 2 . Swansea, Wales, Pineridge Press, 1985, p. 1292-1300. refs

Fluid/solid coupling effects were analyzed using the finite element method as an integrated means and applying both incremental and iterative methods to solve the fluid/structure coupled equations. The incremental procedure with iteration in final steps is proposed. The proposed method was applied to solve an airflow/wing structure coupling problem, and the results were compared with those obtained by using the iterative method alone, with similar findings obtained in both procedures. I.S.

**A86-47107**

### MULTI SHAKER MODAL TESTING USING A MODIFIED TRANSIENT RANDOM EXCITATION

M. CLARK (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 1 . Schenectady, NY, Union College, 1985, p. 553-557. Research supported by the Northrop Independent Research and Development Program. refs

A modal testing method which includes multishaker and transient random modal testing procedures is described. The force and response functions of the testing method are improved with digital-to-analog-converter-driver software and a modified excitation function. The method is applied to a model of a fighter aircraft being tested under transient random single and dual point excitations, true random dual point excitation, and modified transient random dual point excitation conditions. The frequency response and coherence functions are evaluated. It is noted that this method provides improvements in the transfer function and coherence. I.F.

**A86-47122**

### DETERMINING COMPONENT LOADS AND STRESSES WITH IMPROVED SYSTEM MODELING TECHNIQUES

J. W. KLAHS and G. E. TOWNLEY (Structural Dynamics Research Corp., Milford, OH) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 2 . Schenectady, NY, Union College, 1985, p. 941-948. refs

The use of static correction terms to improve the modal representation of components by accounting for the effect of truncated higher frequency modes is analytically discussed. The determination of the dynamic load field experienced by a component in a system and the resulting strains and stresses are examined. The use of modal analysis, system dynamic analysis, and finite element analysis into a very automated procedure for determining complex dynamic loads and stress/strain distributions with a high degree of confidence prior to building and testing a prototype is demonstrated. Modeling considerations and limitations are discussed, and examples are presented. C.D.

**A86-47124**

### IDENTIFICATION OF AEROELASTIC PHENOMENON EMPLOYING BISPECTRAL ANALYSIS TECHNIQUES

J.-H. CHANG, R. O. STEARMAN, D. CHOI, and E. J. POWERS (Texas, University, Austin) IN: International Modal Analysis Conference, 3rd, Orlando, FL, January 28-31, 1985, Proceedings. Volume 2 . Schenectady, NY, Union College, 1985, p. 956-964. refs

The analytical determination of the stability features of a classical bending-torsion degree of freedom aeroelastic system is presented based on the generalized Bolotin's or harmonic balance method. It is found that the system can experience combination and/or parametric resonance phenomena when periodic time-dependent loads are induced along the chordwise dimension of the wing. These phenomena may or may not promote the occurrence of classical flutter or divergence. The advantages of this result for developing techniques in subcritical flutter testing are discussed. C.D.

**A86-47133#**

### ULTRASONIC DIRECT BACKSCATTERING TECHNIQUE FOR MATERIAL SURFACE INSPECTION

E. J. CHERN and G. P. EGAN (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) IN: Symposium on Nondestructive Evaluation, 15th, San Antonio, TX, April 23-25, 1985, Proceedings . San Antonio, TX, Nondestructive Testing Information Analysis Center, 1986, p. 82-88. refs

The experimental results obtained from low cycle fatigue (LCF) surface cracks using the ultrasonic direct backscattering satellite pulse measurements and frequency domain analysis are reported. The specimens examined were an Inconel 718 flat plate with three surface-connected LCE cracks and a DA 718 plate with six cracks of various sizes. The ulrasonic transducer used in the experiment was a 5 MHz broadband longitudinal transducer with a 6-in. focal length. The angle of incidence was varied from 0 to 40 deg incrementally in steps of 10 deg. The experimental results showed improved detectability of fatigue cracks at 20 deg oblique angle of incidence. The defect sizes were estimated based on the satellite pulse delay time and frequency resonance pattern. The ultrasonic results were compared with the metallographic measurements and are in good agreement. The technique can be used to eliminate the inspection dead zone of normal longitudinal inspections. Author

**PRESSURE DROP AND HEAT TRANSFER CHARACTERISTICS OF CIRCULAR AND OBLONG LOW ASPECT RATIO PIN FINS**

S. C. ARORA and W. A. MESSEH *In* AGARD Heat Transfer and Cooling in Gas Turbines 15 p Sep. 1985

Avail: NTIS HC A23/MF A01

The pressure drop and heat transfer characteristics of circular and oblong pin fins of height-to-diameter ratio of unity used to augment internal cooling of gas turbine airfoils are presented. Data were obtained for an array of 10 rows of staggered pin fins in a 25:1 aspect ratio channel, with both pins and channel endwalls forming the heat transfer surface. Results show that the array average friction factor increases with increasing blockage caused by different arrangement of pin fin geometries in the channel. The local heat transfer coefficient increases up to the 3rd row of pin fins and decreases thereafter. Oblong pin fins with gamma=90 deg (major axis parallel to the direction of flow) result in higher heat transfer rates and lower friction factor than the circular pin fins. For other orientations, oblong pin fins do not offer any advantage over circular pin fins for Re or = 20,000 (typical of small gas turbine engines). M.G.

**WAKE-PASSING IN A TURBINE ROTOR CASCADE**

D. J. DOORLY, M. L. G. OLDFIELD, and C. T. J. SCRIVENER (Rolls-Royce Ltd., Derby, England) *In* AGARD Heat Transfer and Cooling in Gas Turbines 18 p Sep. 1985

Avail: NTIS HC A23/MF A01

A technique for generating realistic wakes upstream of a stationary turbine blade cascade at full scale Mach numbers and Reynolds numbers is described. High speed Schlieren photographs showing the development of the wake flow through the cascade are presented, together with unique high speed measurements of the fluctuations of the surface heat transfer rate as the nozzle guide vane (NGV) wakes pass over the rotor blade surface. Combining the flow visualization results with the unsteady heat transfer measurements reveals the radically different nature of the boundary layer transition caused by wake passing; an understanding of which will be essential for the development of improved prediction techniques. **A MODEL FOR CORRELATING FLAT PLATE FILM COOLING EFFECTIVENESS FOR ROWS OF ROUND HOLES**

M. R. LECUYER and F. O. SOECHTING (Pratt and Whitney Aircraft, West Palm Beach, Fla.) *In* AGARD Heat Transfer and Cooling in Gas Turbines 12 p Sep. 1985

Avail: NTIS HC A23/MF A01

An effective method of cooling, that has found widespread application in aircraft gas turbines, is the injection of a film of cooling air through holes into the hot mainstream gas to provide a buffer layer between the hot gas and the airfoil surface. Film cooling has been extensively investigated and the results have been reported in the literature. However, there is no generalized method reported in the literature to predict the film cooling performance as influenced by the major variables. A generalized film cooling correlation has been developed, utilizing data reported in the literature, for constant velocity and flat plate boundary layer development. This work provides a basic understanding of the complex interaction of the major variables effecting film cooling performance. Author

**TRANSIENT THERMAL BEHAVIOUR OF A COMPRESSOR ROTOR WITH VENTILATION: TEST RESULTS UNDER SIMULATED ENGINE CONDITIONS**

E. REILE, U. RADONS, and D. K. HENNECKE *In* AGARD Heat Transfer and Cooling in Gas Turbines 9 p Sep. 1985

Avail: NTIS HC A23/MF A01

The development of advanced compressors for modern aero-engines requires detailed knowledge of the transient thermal behavior of the rotor disks to enable accurate prediction of rotor life and, additionally, of the thermal growth of the rotor for the evaluation of tip clearances. In the quest for longer life and higher reliability of the parts as well as reduced clearances even at transient conditions, the designer has to be able to influence the thermal behavior of the rotor. A very effective way is to vent small amounts of air through the rotor cavities. The design of such a vented rotor is presented. The main emphasis is placed on a detailed description of a test rig specially built for this purpose. The testing was carried out under simulated engine conditions for a wide range of parameters. The results are compared with those obtained with a theoretical model derived from fundamental tests at the University of Sussex, where heat transfer in rotating cavities is investigated. Good agreement is observed. Some final tests were done in an engine. The results also exhibit good agreement with the rig results under simulated conditions, when the proper dimensionless parameters are considered, providing the validity of the simulation. Author

**HEAT EXCHANGERS IN REGENERATIVE GAS TURBINE CYCLES**

M. N. R. NINA and M. P. N. AGUAS *In* AGARD Heat Transfer and Cooling in Gas Turbines 8 p Sep. 1985

Avail: NTIS HC A23/MF A01

Advances in compact heat exchanger design and fabrication together with fuel cost rises continuously improve the attractability of regenerative gas turbine helicopter engines. In this study cycle parameters aiming at reduced specific fuel consumption and increased payload or mission range, have been optimized together with heat exchanger type and size. The discussion is based on a typical mission for an attack helicopter in the 900 kw power class. A range of heat exchangers is studied to define the most favorable geometry in terms of lower fuel consumption and minimum engine plus fuel weight. Heat exchanger volume, frontal area ratio and pressure drop effect on cycle efficiency are considered. Author

**CERAMIC HEAT EXCHANGERS FOR GAS TURBINES OR TURBOJET ENGINES**

S. BOUDIGUES and J. FABRI *In* AGARD Heat Transfer and Cooling in Gas Turbines 14 p Sep. 1985 In FRENCH; ENGLISH summary

Avail: NTIS HC A23/MF A01

Heat exchangers made of steel and placed downstream of the last turbine of a turbojet engine or any gas turbine are too heavy and too cumbersome. With a heat exchanger made of silicon carbide mass, performance, volume and cost balances which greatly benefit civilian or military use can be obtained. Silicon carbide has good thermal performance and makes it possible to situate the heat exchanger between turbine stages. Both the pressure of cold and hot gases are thus increased, the heat exchange processes are amplified, the length and the diameter of the exchanger are reduced. With the density of this material being only 3.2, the overall mass of the exchanger is considerably reduced. It is also possible to shortcut part of the cold air, and thus obtain a controlling parameter. A kind of after burner effect is obtained, although a single combustor is used, and the corresponding thermodynamic process has a higher efficiency than the after burning process. Author

**EFFECT OF FILM COOLING ON THE AERODYNAMIC PERFORMANCE OF A TURBINE CASCADE**

O KOELLEN and W. KOSCHEL *In* AGARD Heat Transfer and Cooling in Gas Turbines 16 p Sep. 1985

Avail: NTIS HCA23/MF A01

The aerodynamic performance of a film cooled turbine cascade for a typical design with multiple rows of cooling holes was investigated in an annular cascade rig with air at room temperature. The work was concentrated on the individual effect of the injection row position on the aerodynamic cascade losses and on the downstream flow field. For six different single row configurations the tests were conducted in a wide range of varying coolant mass flow rates and main stream Mach numbers. Typical results of these measurements are presented and discussed. Three models for the aerodynamic loss prediction based on different theoretical approaches, which are known from literature, were examined and improved. The presented two mixing layer models take into account the penetration of the injected cooling air into the main stream, whereas the third model predicts flow losses by a boundary layer calculation with film cooling air injection. Some tests with flow visualization by Schlieren photography were carried out showing the mixing effects of the injected coolant flow. Finally results of the predicted performance are compared with the experimental data. M.G.

**AERODYNAMIC EFFECT OF COOLANT EJECTION IN THE REAR PART OF TRANSONIC ROTOR BLADES**

F. H. KOST and A. T. HOLMES (Rolls-Royce Ltd., Bristol, England) *In* AGARD Heat transfer and Cooling in Gas Turbines 12 p Sep. 1985

Avail: NTIS HC A23/MF A01

An investigation of transonic turbine blades designed by Rolls-Royce/Bristol concerning the aerodynamic penalties of coolant flow for two alternative cooling configurations is discussed. Rolls-Royce designed a blade with a thick trailing edge where the coolant is ejected through slots in the trailing edge and a second blade with a thin trailing edge where coolant is ejected through a row of holes on the pressure side and a row of holes on the suction side. Tests were performed in a plane cascade wind tunnel. The results indicate the sensitivity of the blade performance to cooling configuration and coolant flow rate. By combining measured data from blade surface and wake traverses it was possible to separate the various loss mechanisms. Therefore, the separate losses due to the momentum of the coolant, change of base pressure, and change of blade friction could be determined quantitatively as a function of coolant flow rate. M.G.

**EXPERIMENTAL RESULTS OF THE CONTROL OF A VORTICAL FLOW BY TANGENTIAL BLOWING**

N. J. WOOD and L. ROBERTS May 1986 73 p Sponsored by NASA

(NASA-CR-176932; NAS 1.26:176932; JIAA-TR-71) Avail: NTIS HC A04/MF A01 CSCL 20D

The results of a wind tunnel test to investigate the controlling effects of tangential, leading edge blowing on the vortical flow over a delta wing are given. Blowing is used to directly control the crossflow separation points at the rounded leading edge and hence, the trajectory of the feeding sheet and the location of the vortex. Experiments were conducted for both co-flowing and counter-flowing configurations over a range of angles of attack from 0 to 90 degrees. Results in the form of pressure distributions, overall force coefficients and flow mappings were obtained. The emphasis is on data presentation rather than detailed analysis. The initial results indicate that the co-flowing configuration was capable of extending the regime of stable, controlled vortical flow over the upper surface by approximately 30 degrees angle of attack for modest blowing requirements. Increases in maximum normal force coefficient of approximately 30% were achieved and significant rolling moments produced at angles of attack from 30 to 60 degrees. The counter-flowing configuration indicated only minor lift augmentation with the exception of an isolated occurrence at 20 degrees angle of attack. At that condition, with very weak blowing, a lift augmentation of approximately 20 was measured.

Active laser gyroscopes suffer from a lock-in phenomenon, a result of backscatter from the cavity optical elements, which limit their performance in the regime of near-zero rotation. The flip-flop gyro proposed and initially investigated under this effort shows potential for minimizing or avoiding this lock-in effect. The need for a high accuracy, inexpensive and reliable clock, suitable for avionics applications was the motivation for the laser clock proposed and studied during the course of this effort. Both devices require and deserve further investigation to properly demonstrate their utility. GRA

S. M. STUBBS and J. A. TANNER Aug. 1986 23 p
(NASA-TM-87719; L-16137; NAS 1.15:87719) Avail: NTIS HC A02/MF A01 CSCL 20K

An experimental investigation was conducted at the Langley Research Center to determine a method for towing an aircraft to measure the side forces of a free-swiveling nose gear due to variations in bank angle. A F-106 aircraft and the Space Shuttle orbiter OV-101 were towed to measure side forces on full-size aircraft for bank angles up to 3 deg. These tests indicate that substantial side forces will occur if an aircraft is rolling on a runway in a banked attitude even when the nose gear is free to swivel. Corotation of a twin-tire nose gear appears to cause a substantial increase in side force due to bank angle compared with a nose gear with indepdendently rotating wheels. Author

**STATIC AEROELASTIC ANALYSIS USING AIRCRAFT VIBRATION MODES**

Z. SHEENA and M. KARPEL *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 229-232 1985
Avail: NTIS HC A99/MF E03

A method for the calculation of the airload distribution and aeroelastic effectiveness parameters of a flexible aircraft from the distribution of a rigid one, using its vibration modes, is presented. The method uses modal data of the model in the form of a limited number of low frequency mode shapes and their associated generalized stiffnesses. The mathematical operations are done on the generalized matrices of the model which have a small number of degrees of freedom. The method can calculate the static aeroelastic properties of a free-free aircraft using its elastic, inertial, and aerodynamic properties. The method is suitable for making parametric analyses involving changes in the stiffness of the structure and the aerodynamics of the model. Numerical examples are given and the convergence with the number of modes taken into account is discussed. ESA

**ADVANCES IN GROUND VIBRATION TESTING USING A COMBINATION OF PHASE RESONANCE AND PHASE SEPARATION METHODS**

N. NIEDBAL *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 523-528 1985
Avail: NTIS HC A99/MF E03

A ground vibration test (GVT) method that uses the complex response modes obtained directly from harmonic excitation near resonance with the arbitrary force distribution to set up the generalized dynamic equation of motion without knowledge of normal modes and normal mode parameter was derived. The dominating quantities of the method are the response mode matrices and the characteristic matrices which may be compared with the generalized mass and stiffness matrices of the phase resonance method. It is demonstrated how to derive normal mode shapes and associated normal mode parameters from the information contained in the characteristic matrices and in the response mode matrices. The method was validated by applying it to the solution of a flutter problem and the evaluation of normal mode parameters. Data were obtained from a GVT performed on a full-scale aircraft. ESA

**ASSESSING THE EFFECTS OF DELAMINATIONS ON THE POSTBUCKLING STRENGTH OF CRFP PANELS**

W. M. BANKS, J. RHODES, and G. B. CHAI *In* ESA Proceedings of a Workshop on Composites Design for Space Applications p 197-202 Feb. 1986 Sponsored by UK Ministry of Defense and ESA
Avail: NTIS HC A16/MF A01

The effect of deliberately inbuilt delaminations on the postbuckling strength of carbon fiber composite panels with a b/t ratio of 70 and 50 was tested. The panels are fabricated from 14 layers of unidirectional carbon fiber using an autoclave process. The delamination positions were chosen to coincide with the position of highest interlaminar shear stress, the position of highest direct strain, the central buckle peak, and the inflection points on the panel. The control panel for a b/t ratio of 68.57 failed prematurely due to unforeseen edge effects. However it is clear that the worst position for delamination is when it coincides with the highest interlaminar shear stress at the edge of the panel. There appears to be little effect with the delamination at the buckle peak. ESA

**FIRE EXTINGUISHING AGENTS FOR OXYGEN-ENRICHED ATMOSPHERES Final Report, 1 Apr. 1982 - 30 Nov. 1985**

M. A. PLUGGE, C. W. WILSON, D. M. ZALLEN, and J. L. WALKER Dec. 1985 98 p
(Contract F29601-81-C-0013)
(AD-A166967; NMERI-TA3-19; ESL-TR-85-26) Avail: NTIS HC A05/MF A01 CSCL 13L

Fire-suppression agent requirements for extinguishing fires in oxygen-enriched atmospheres were determined employing small-, medium-, large-, and full-scale test apparatuses. The small- and medium-scale tests showed that a doubling of the oxygen concentration required five times more HALON for extinguishment. For fires of similar size and intensity, the effect of oxygen enrichment of the diluent volume in the HC-131A was not as grate as in the smaller compartments of the B-52 which presented a higher damage scenario. The full-scale tests showed that damage to the airframe was as important a factor in extinguishment as oxygen enrichment. GRA

(AD-A166991; MTR-9622-VOL-1) Avail: NTIS HC A07/MF A01 CSCL 20N

The Air Force SINCGARS VHF-FM radio is a frequency-hopping anti-jam device utilizing electrically short antenna to minimize aerodynamic drag on airborne platforms. The development of optimally efficient, electronically tuneable antennas for this radio is of interest. Although the antenna groundplane is platform-dependent, it is usually small compared to an rf wavelength. A circular groundplane provides a standardized geometry with which to model and evaluate candidate antennas. Accordingly, a VHF antenna range with an 8 ft. diameter circular groundplane has been constructed to evaluate candidate antennas. The electrical properties of a monopole element at the center of a circular groundplane of finite radius are of interest to this program for (1) qualifying the antenna range; (2) establishing antenna standards with which to measure test antennas; and (3) modeling candidate antennas. A survey of the literature revealed that although this antenna has the simplest geometry of any monopole antenna, its properties are neither well understood nor standardized, particularly for groundplane radii which are small or comparable to a wavelength. This paper attempts to address this deficiency. Author (GRA)

(AGARD-AG-300-VOL-4; ISBN92-835-1530-7) Avail: NTIS HC A07/MF A01

The different types of aircraft antennas, their radiation characteristics and their preferred siting on the airframe are described. Emphasis is placed on the various methods for determining aircraft antenna radiation patterns (ARP) and advantages, disadvantages and limitations of each method are indicated. Mathematical modelling, model measurements and in-flight measurements in conjunction with the applied flight test techniques are included. Examples of practical results are given. Methods of determining aircraft radar characteristics are also described, indicating advantages, disadvantages and limitations of each method. Relevant fundamentals of radar theory are included only as necessary to appreciation of the real meaning of radar cross section (RCS) and angular glint. The measuring methods included are dynamic full-scale, static full-scale, sub-scale optical, ultrasonic and radio modelling. References are made to RCS measuring facilities in the USA and Europe and the UK Radio Modelling Facility is used extensively to exemplify the sub scale technique. Author

(NASA-CR-4004; NAS 1.26:4004; ARAP-577) Avail: NTIS HC A03/MF A01 CSCL 20D

The integral conservation laws of fluid mechanics are used to assess the drag efficiency of lifting wings, both CTOL and various out-of-plane configurations. The drag-due-to-lift is separated into two major components: (1) the induced drag-due-to-lift that depends on aspect ratio but is relatively independent of Reynolds number; (2) the form drag-due-to-lift that is independent of aspect ratio but dependent on the details of the wing section design, planform and Reynolds number. For each lifting configuration there is an optimal load distribution that yields the minimum value of drag-due-to-lift. For well designed high aspect ratio CTOL wings the two drag components are independent. With modern design technology CTOL wings can be (and usually are) designed with a drag-due-to-lift efficiency close to unity. Wing tip-devices (winglets, feathers, sails, etc.) can improve drag-due-to-lift efficiency by 10 to 15% if they are designed as an integral part of the wing. As add-on devices they can be detrimental. It is estimated that 25% improvements of wing drag-due-to-lift efficiency can be obtained with joined tip configurations and vertically separated lifting elements without considering additional benefits that might be realized by improved structural efficiency. It is strongly recommended that an integrated aerodynamic/structural approach be taken in the design of (or research on) future out-of-plane configurations. Author

An extensive experimental study of three-dimensional shock wave turbulent boundary layer interactions caused by shock generators defined solely by angles has been carried out at Mach 3. Sharp fins, sharp swept fins, swept wedges, and semi-cones have been used to generate a wide range of shock waves. The interaction of these waves with turbulent boundary layers has been investigated by surface flow visualization, mean surface static pressure distributions, flowfield surveys of total pressure and yaw, and several flowfield visualization techniques. Some exploratory high frequency surface pressure measurements have been carried out to evaluate the steadiness of these interactions. Scaling laws for both surface and flowfield features have been derived. Some limited studies were carried out at a Mach number of 2. A flowfield study has shown that the initial part of interactions caused by the same strength and geometrical shock wave generated by different shock generators are all similar. The footprints of the interactions, as shown by surface flow visualization, can be categorized as approximately conical or cylindrical, and the boundaries between these two regions have been defined for both Mach 3 and Mach 2. There are still questions with regards to the detailed flowfield structures and physical mechanisms, but the three-dimensional interactions appeared to be less unsteady than that of two-dimensional separated flows. All three flowmeter concepts (vortex, dual turbine, and angular momentum) were subjected to experimental and analytical investigation to determine the potential portotype performance. The three concepts were subjected to a comprehensive rating. Eight parameters of performance were evaluated on a zero-to-ten scale, weighted, and summed. The relative ratings of the vortex, dual turbine, and angular momentum flowmeters are 0.71, 1.00, and 0.95, respectively. The dual turbine flowmeter concept was selected as the primary candidate and the angular momentum flowmeter as the secondary candidate for prototype development and evaluation. B.G.

**AEROELASTIC CONSIDERATIONS FOR TORSIONALLY SOFT ROTORS**
W. R. MANTAY and W. T. YEAGER, JR. Aug. 1986 20 p Presented at the AHS 2nd Decennial Specialists' Meeting on Rotorcraft Dynamics, Moffett Field, Calif., 7-9 Nov. 1984
(NASA-TM-87687; NAS 1.15:87687; USAAVSCOM-TR-86-B-1) Avail: NTIS HC A02/MF A01 CSCL 20K

A research study was initiated to systematically determine the impact of selected blade tip geometric parameters on conformable rotor performance and loads characteristics. The model articulated rotors included baseline and torsionally soft blades with interchangeable tips. Seven blade tip designs were evaluated on the baseline rotor and six tip designs were tested on the torsionally soft blades. The designs incorporated a systemmatic variation in geometric parameters including sweep, taper, and anhedral. The rotors were evaluated in the NASA Langley Transonic Dynamics Tunnel at several advance ratios, lift and propulsive force values, and tip Mach numbers. A track sensitivity study was also conducted at several advance ratios for both rotors. Based on the test results, tip parameter variations generated significant rotor performance and loads differences for both baseline and torsionally soft blades. Azimuthal variation of elastic twist generated by variations in the tip parameters strongly correlated with rotor performance and loads, but the magnitude of advancing blade elastic twist did not. In addition, fixed system vibratory loads and rotor track for potential conformable rotor candidates appears very sensitive to parametric rotor changes. Author

**DYNAMIC STALL - THE CASE OF THE VERTICAL AXIS WIND TURBINE**

A. LANEVILLE and P. VITTECOQ (Sherbrooke, Univesite, Canada) ASME, Transactions, Journal of Solar Energy Engineering (ISSN 0199-6231), vol. 108, May 1986, p. 140-145. IREG-NSERC-supported research. refs

This paper presents the results of an experimental investigation on a driven Darrieus turbine rotating at different tip speed ratios. For a Reynolds number of 3.8 x 10 to the 4th, the results indicate the presence of dynamic stall at tip speed ratio less than 4, and that helicopter blade aerodynamics can be used in order to explain some aspects of the phenomenon. It was observed that in deep stall conditions, a vortex is formed at the leading edge; this vortex moves over the airfoil surface with 1/3 of the airfoil speed and then is shed at the trailing edge. After its shedding, the vortex can interact with the airfoil surface as the blade passes downstream. Author

**FORECASTING FOR CIVIL AVIATION. II**

L. DENT (Meteorological Office, Bracknell, England) Weather (ISSN 0043-1656), vol. 41, March 1986, p. 82-89.

The distinguishing features of long-haul intercontinental flights, short-haul continental flights and general aviation (transporting of business executives, etc.) are outlined and examples of flight documentation are provided. It is noted that the two primary concerns for both pilot and forecaster are air safety and economics. While the former requires constant vigilance on the part of aircrews, ground crews, meteorological observers and forecasters, the latter requires careful calculation of just how much fuel is needed for a flight. In effect, route winds and temperatures must be determined with great accuracy. K.K.

**LLWAS - AN INTEGRAL PART OF THE U.S. WIND-SHEAR SAFETY PROGRAMME**

C. B. BAKER, D. W. GILMORE, and R. MCCALL (Climatronics Corp., Bohemia, NY) ICAO Bulletin, vol. 41, March 1986, p. 11-13.

The use of the low level wind shear alert system (LLWAS) to detect wind shear and provide warnings for aircraft is examined. Wind shear alters lift forces and causes abrupt changes in wind direction and velocity within a very small area and for a short period of time. Wind shear is either vertical or horizontal and is classified into micro, meso, and synoptic scale groups. The effects of micro-and macro-mesoscale wind shear on aircraft are described. The LLWAS consists of an array of wind sensors composed of a center-field unit and five outlying remote stations; the system provides continuous display of wind data to the air traffic control tower. Modifications to the system, such as improving the gust direction algorithm, the display, and the speed and accuracy of the ground/pilot communications, are studied. The need to train pilots and ground personnel for recognition avoidance and reaction to wind-shear events is discussed. The development of a wind shear detection system that combines the capabilities of the LLWAS and Doppler detection systems is proposed. I.F.

**THE PHYSICAL AND EMPIRICAL BASIS FOR A SPECIFIC CLEAR-AIR TURBULENCE RISK INDEX Final Report, 2 Jul. 1982 - 30 Aug. 1985**

J. L. KELLER Washington NASA Apr. 1986 48 p
(Contract NAS8-34687)
(NASA-CR-3971; NAS 1.26:3971) Avail: NTIS HC A03/MF A01 CSCL 04B

The fundamental emphasis of this research was to develop a technique which would be a significant improvement over those currently used for flight planning to avoid clear air turbulence (CAT). The technique should, ideally, be both quantitative in determining potential intensity and specific in locating regions of relatively high risk. Furthermore, it should not rely on specialized data but be functional using the currently available rawinsonde observation (raob) system. Encouraging results documented in an earlier investigation were considered compelling enough to warrant a closer look into the possibilities of a Specific Clear Air Turbulence Risk (SCATR) index approach to the clear air turbulence problem. Unlike that research, which considered sustained periods of flight in light to moderate clear air turbulence, this study focuses on several cases of documented severe CAT. Results of these case studies suggest that a SCATR index is not an unrealizable goal and that uses of such an index, event in its current prototype level of development, are also apparent. Author

**APPLICATION OF ADAPTIVE CONTROL TO AIRCRAFT SYSTEMS**

Z. CHEN and H. ZHANG (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 513-520. In Chinese, with abstract in English. refs

The competition of the adaptive technique with other techniques is reviewed. The inherent drawback of the adaptive technique in application to aircraft systems is considered in the light of the analysis of the features of flight control systems. The potentials and perspectives of the adaptive technique are also suggested. The development of advanced aircraft demands performance beyond the capacity of the airdata scheduling technique. Therefore, the adaptive control schemes are expected to be applied to these flight control problems. In order to make full use of the advantages, such as saving sensor hardware, requiring less prior knowledge of aircraft and providing higher flexibility, it is necessary to carry out robustness research of existing adaptive control schemes and to develop new more robust adaptive control schemes. **AN OPTIMAL PARAMETER ESTIMATION METHOD COMPATIBLE WITH STABLE PARAMETER PREDICTION IN TIME DOMAIN**

H. GAN and Y. WU (Harbin Institute of Technology, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Dec. 1985, p. 565-571. In Chinese, with abstract in English. refs

A compatible identification algorithm is presented, in which the Lainiotis (1976) general partitioning identification algorithm (GPIA) is combined with the model reference identification algorithm (MRIA) based on the stability theory of Liapunov. By means of this algorithm, the residuals of the system can approach to zero asymptotically and variance of the residuals can be minimized. In the GPIA-MRIA algorithm, GPIA gives a linear optimal estimation of state and parameters according to a finite measurement set, and MIRA offers an asymptotical approach of the models. This means that GPIA contributes the state estimator of MRIA on the one hand, and on the other hand MRIA predicts the parameters and adjusts the model of GPIA to an optimal estimation of the parameters. This method has been applied to identification of aerodynamic coefficients and control derivatives of an aircraft, by means of digital simulation. It is shown that this method is superior to the single GPIA in accuracy of identification and speed of convergence, and requires almost no increase in the capacity of computation. Author

### ON A METHOD FOR PILOT DYNAMICS IDENTIFICATION REFLECTING FEEDBACK STRUCTURES

N. GOTO (Kyushu University, Fukuoka, Japan) Kyushu University, Technology Reports (ISSN 0023-2718), vol. 58, Dec. 1985, p. 985-991. In Japanese, with abstract in English. refs

A statistical method that has been used to study pilot control behavior in multiloop situations is extended to the identification of pilot dynamics in a class of feedback systems with an inner loop. The method utilizes the autoregressive scheme and determines the unknown dynamics by reducing the system to a feedback structure suited to the scheme. Distinguishing the system structure with an inner loop from other candidate system structures is possible by examining the correlation characteristics of the innovation processes as well as the identified dynamics. To test the method, a digital simulation study is conducted, treating the longitudinal flight-path control of an aircraft as an example in which the pilot is considered to tightly close the pitch-attitude-control inner loop. The results show that the method checks the feedback structure of the concernod system and yields good estimates of the unknown dynamics as well. The method seems to be feasible enough to be applied to the analysis of real flight and simulator test data. Author

### SMART BUILT-IN-TEST (BIT)

K. A. HALLER, J. D. ZBYTNIEWSKI (Grumman Aerospace Corp., Bethpage, NY), and K. ANDERSON (Bolt Beranek and Newman, Inc., Cambridge, MA) IN: AUTOTESTCON '85; Proceedings of the International Automatic Testing Conference, Uniondale, NY, October 22-24, 1985 . New York, Institute of Electrical and Electronics Engineers, 1985, p. 140-147.

This paper summarizes the Smart BIT study performed under contract to Rome Air Development Center, Griffiss Air Force Base, NY. Current and state-of-the-art design techniques for Built-In-Test (BIT) were surveyed along with Artificial Intelligence (AI) techniques applicable to the identification and reduction of BIT false alarms and intermittents. Analysis of each potentially useful concept ascertained which techniques would be feasible for system application. Techniques were selected from those deemed feasible and several were incorporated as part of the demonstration system. An AI diagnostic program on a remote LISP machine performed the levels of reasoning required to identify false alarms inserted under the control of a local computer connected to the test unit. ### SINUSOIDAL DISTURBANCE REJECTION WITH APPLICATION TO HELICOPTER FLIGHT DATA ESTIMATION

G. C. GOODWIN, R. J. EVANS (Newcastle, University, Australia), R. L. LEAL (Centro de Investigaciones y Estudios Avanzados, Mexico City), and R. A. FEIK (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) IEEE Transactions on Acoustics, Speech, and Signal Processing (ISSN 0096-3518), vol. ASSP-34, June 1986, p. 479-484. refs

This paper is concerned with the problem of eliminating sinusoidal disturbances from data while producing minimal distortion to the underlying data. A particular example of this problem arises in the filtering of helicopter data which are corrupted by sinusoidal disturbances due to rotor motion. It is shown that an optimal solution to the problem can be found using Kalman filtering theory. The properties of the optimal filter are analyzed using recent results on filtering for nonstabilizable systems. These results are then used to motivate a particular near-optimal filter which has enhanced robustness properties relative to the optimal filter. It will be shown that an identical filter can be derived using recent results on the evaluation of recursive discrete Fourier transforms. This link between time and frequency domain methods leads to a rather complete understanding of the characteristics of the filter. Specific results are presented showing the application of the filter to real helicopter data. Author

### RECTANGULAR PARALLELEPIPED CODING - A VOLUMETRIC REPRESENTATION OF THREE-DIMENSIONAL OBJECTS

Y. C. KIM and J. K. AGGARWAL (Texas, University, Austin) IEEE Journal of Robotics and Automation (ISSN 0882-4967), vol. RA-2, Sept. 1986, p. 127-134. refs
(Contract F49620-85-K-0007)

A new three-dimensional object representation scheme called rectangular parallelepiped coding is presented. Rectangular parallelepiped coding is an extension to three-dimensional space of the two-dimensional rectangular coding scheme. It is a volume-based representation of three-dimensional objects constructed from three orthogonal views (silhouettes) of the object using volume intersection method and is coded as a list of rectangular parallelepipeds. The representation is versatile and easily edited. For the objects coded in this representation, the operations of translation, rotation, and scaling are easily performed and the properties of volume, surface, and moments are easily computed. Examples are given for which processing time and storage requirements are examined. Author

### USE OF BLOCK-PULSE FUNCTIONS IN THE OPTIMAL CONTROL OF DETERMINISTIC SYSTEMS

C. HWANG, D.-H. SHIH, and F.-C. KUNG (National Cheng Kung University, Tainan, Republic of China) International Journal of Control (ISSN 0020-7179), vol. 44, Aug. 1986, p. 343-349. refs

The synthesis of an optimal control function for deterministic systems described by intergrodifferential equations is investigated. By using the elegant operational properties of block-pulse functions, a directly computable algorithm for evaluating the optimal control and trajectory of deterministic systems is developed. An example is given to illustrate the utility of this method. Author

### THE SINGULAR-G METHOD FOR UNSTABLE NON-MINIMUM-PHASE PLANTS

I. HOROWITZ (California, University, Davis; Weizmann Institute of Science, Rehovot, Israel) International Journal of Control (ISSN 0020-7179), vol. 44, Aug. 1986, p. 533-541. refs
(Contract NSF ECS-83-03333; F33615-83-C-3000)

In linear time-invariant feedback systems with plants which have both poles and zeros in the right half-plane, it is always possible to stabilize the system for a fixed plant. But in the previous optimum techniques, the stability margins might be so small as to render the design wholly impractical. This problem was overcome in the X-29 aircraft in a multiple-input-multiple-output (MIMO) setting, by use of a singular-G (compensation) matrix inside the loop. Excellent stability margins were then achievable over a wide plant parameter range, by means of a fixed-G compensation matrix. This paper extends the singular-G technique to the single-input-single-output plant. The latter is converted into an equivalent N x N MIMO plant by means of N parallel independent time-varying modulators acting on the plant output, a technique previously used for nonlinear network synthesis. The singular-G method is then applicable to the equivalent N x N MIMO plant. The detailed design procedure is presented by means of an example with $N = 2$. Author

**SIMULATION OF THE ALGORITHMS OF A NAVIGATION COMPUTER [SYMULACJA ALGORYTMOW KOMPUTERA NAWIGACYJNEGO]**

M. LIJOWSKI Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 103, 1985, p. 37-52. In Polish. refs

Methods for determining the position of an aircraft on the basis of the signals obtained from the air data unit, an induction gyrocompass, two VOR receivers, an automatic direction finder and a Doppler radar set are discussed. Problems connected with the search for radio stations of optimum location are explained as algorithms for the joint operation of the navigation computer with the map indicator. The programs were tested, showing the correctness of the proposed algorithms and the possibility of their realization in real time. Author

**A86-46377**

**A FAST SHAPE DESCRIPTOR**

J. MA, C.-K. WU, and X.-R. LU (Northwest Telecommunication Engineering Institute, Xian, People's Republic of China) Computer Vision, Graphics, and Image Processing (ISSN 0734-189X), vol. 34, June 1986, p. 282-291. refs

A fast normalized shape descriptor for digital pattern-recognition and classification applications is developed and demonstrated. The descriptor employs the rapid transformation of Reitboeck and Brody (1968), preceded by a distance transform to assure invariance to rotation. The performance of the descriptor is compared experimentally with that of a normalized Fourier descriptor (Wallace and Wintz, 1980) in problems involving two-dimensional aircraft images. The new descriptor is found to be faster than and just as accurate as the Fourier descriptor, and to require significantly less memory storage capacity. T.K.

**CONTROLLABILITY THEORY OF DISCRETE DYNAMIC SYSTEMS**

R. G. FARADZHEV, MR. PHAT VU NGOC, and A. V. SHAPIRO Automation and Remote Control (ISSN 0005-1179), vol. 47, no. 1, June 10, 1986, pt. 1, p. 1-20. Translation. refs

The current status of discrete dynamics systems controllability theory is reviewed as well as applications and prospects for further development. Consideration is given to systems that are linear, bilinear, nonlinear, finite, ordinary modified and multiparameter in nature. It is noted that the theory of controllability in time systems is applied in such areas as biology, mechanics, and aircraft/spacecraft control; in multiparameter systems, this theory plays a major role in designing the means for digital display processing and multidimensional data arrays. In the case where space-time multidimensional discrete systems are combined with finite control methods, the theory of controllability potentially plays a significant role in synthesizing optimal high-speed antenna arrays and plasma processes. Problems related to these applications are discussed. K.K.

**DEVELOPMENT OF AN ALGORITHM TO MODEL AN AIRCRAFT EQUIPPED WITH A GENERIC CDTI DISPLAY**

W. C. DRISCOLL (Youngstown State Univ., Ohio.) and J. A. HOUCK Jul. 1986 58 p

(NASA-TM-87732; NAS 1.15:87732) Avail: NTIS HC A04/MF A01 CSCL 12A

A model of human pilot performance of a tracking task using a generic Cockpit Display of Traffic Information (CDTI) display is developed from experimental data. The tracking task is to use CDTI in tracking a leading aircraft at a nominal separation of three nautical miles over a prescribed trajectory in space. The analysis of the data resulting from a factorial design of experiments reveals that the tracking task performance depends on the pilot and his experience at performing the task. Performance was not strongly affected by the type of control system used (velocity vector control wheel steering versus 3D automatic flight path guidance and control). The model that is developed and verified results in state trajectories whose difference from the experimental state trajectories is small compared to the variation due to the pilot and experience factors. **A CANONICAL FORM FOR NONLINEAR SYSTEMS**

R. SU and L. R. HUNT (Texas Univ., Dallas.) 1986 21 p

(Contract NAG2-203; NAG2-189; N0014-76-C-1136; N00014-84-C-0104)

(NASA-CR-176974; NAS 1.26:176974) Avail: NTIS HC A02/MF A01 CSCL 09B

The concepts of transformation and canonical form have been used in analyzing linear systems. These ideas are extended to nonlinear systems. A coordinate system and a corresponding canonical form are developed for general nonlinear control systems. Their usefulness is demonstrated by showing that every feedback linearizable system becomes a system with only feedback paths in the canonical form. For control design involving a nonlinear system, one approach is to put the system in its canonical form and approximate by that part having only feedback paths.

**FINITE STATE MODELLING OF AEROELASTIC SYSTEMS FOR ACTIVE CONTROL APPLICATIONS: A GENERAL THEORY**

R. VEPA *In* DGLR The 2nd International Symposium on Aeroelasticity and Structural Dynamics p 309-319 1985
Avail: NTIS HC A99/MF E03

The theory of modeling aeroelastic systems by finite state models is discussed. The models are classified as autonomous finite state models, time varying system models, and differential delay system models. It is shown that control law synthesis for active control can be performed using the differential delay model, which does not contribute to any additional states and is valid for the closed and open loop cases. However, control law implementation requires that the states used for feedback be measured directly or estimated from measurements which are linear combinations of system states. Direct measurements of all feedback states is probably not practical so that sensor output data processing is required. Two alternatives are the statistical Kalman-Bucy filter with error dynamics governed by the statistics of the measurements noise, and a state estimator with error dynamics selected arbitrarily. ESA

**CONTROL DESIGN FOR ROBUST STABILITY IN LINEAR REGULATORS: APPLICATION TO AEROSPACE FLIGHT CONTROL Final Report, 1 Jun 1985 - 17 Jul. 1986**

R. K. YEDAVALLI 1986 63 p
(Contract NAG1-578)
(NASA-CR-176858; NAS 1.26:176858) Avail: NTIS HC A04/MF A01 CSCL 09B

Time domain stability robustness analysis and design for linear multivariable uncertain systems with bounded uncertainties is the central theme of the research. After reviewing the recently developed upper bounds on the linear elemental (structured), time varying perturbation of an asymptotically stable linear time invariant regulator, it is shown that it is possible to further improve these bounds by employing state transformations. Then introducing a quantitative measure called the stability robustness index, a state feedback conrol design algorithm is presented for a general linear regulator problem and then specialized to the case of modal systems as well as matched systems. The extension of the algorithm to stochastic systems with Kalman filter as the state estimator is presented. Finally an algorithm for robust dynamic compensator design is presented using Parameter Optimization (PO) procedure. Applications in a aircraft control and flexible structure control are presented along with a comparison with other existing methods. Author

Avail: NTIS HC A99/MF E03 CSCL 12A

Conformal mapping is a classical technique utilized for solving problems in aerodynamics and hydrodynamics. Conformal mapping is utilized in the construction of grids around airfoils, engine inlets and other aircraft configurations. These shapes are transformed onto a near-circle image for which the equations of fluid motion are discretized on the mapped plane and solved numerically by utilizing the appropriate techniques. In comparison to other grid-generation techniques such as algerbraic or differential type, conformal mapping offers an analytical and accurate form even if the grid deformation is large. One of the most appealing features is that the grid can be constrained to remain orthogonal to the body after the transformation. Hence, the grid is suitable for analyzing the supersonic flow past a blunt object. The associated shock as a coordinate surface adjusts its position in the course of computation until convergence is reached. The present work applied conformal mapping to 3-D bodies with no axis of symmetry such as the Aerobraking Flight Experiment (AFE) vehicle, transforming the AFE shape onto a near-circle image. A numerical procedure and code are used to generate grids around the AFE body. Author

**MODELLING OF ACOUSTIC RADIATION PROBLEMS ASSOCIATED WITH TURBOMACHINERY AND ROTATING BLADES**

W. EVERSMAN (Missouri-Rolla, University, Rolla) IN: Flow of real fluids . Berlin and New York, Springer-Verlag, 1985, p. 63-72. refs

Finite element methods developed for computational predictions of turbofan and propeller acoustic radiation are presented. Account is taken of the disparate acoustic and geometric scales, the complex geometry, sound propagation in a nonuniformly flowing medium, the presence of a lining, and definition of bounds for calculations which are carried out in an unbounded domain. Density and pressure perturbations in the turbofan inlet are modeled with a linearized momentum equation. The sound radiation is represented by the Fourier components, i.e., angular modes. The same nacelle geometry is used for propeller noise, which requires inclusion of acoustic volume sources and forces. A forced convected wave equation for harmonic driving is obtained by combining continuity, momentum and state equations linearized for acoustic perturbations. The weak formulations for the two types of noise generation are solved by the Galerkin method modified with a frontal solver to reduce the required computer time. Model predictions show good agreement with experimental data for the directivity and amplitude of sound from the bellmouth inlet of the NASA-Langley Spinning Mode Synthesizer. M.S.K.

**HELICOPTER TAIL ROTOR NOISE**
S.-T. CHOU and A. R. GEORGE (Cornell University, Ithaca, NY) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 16 p. NASA-supported research. Previously announced in STAR as N86-26163. refs
(AIAA PAPER 86-1900)

A study was made of helicopter tail rotor noise, particularly that due to interactions with the main rotor tip vortices, and with the fuselage separation mean wake. The tail rotor blade-main rotor tip vortex interaction is modelled as an airfoil of infinite span cutting through a moving vortex. The vortex and the geometry information required by the analyses are obtained through a free wake geometry analysis of the main rotor. The acoustic pressure-time histories for the tail rotor blade-vortex interactions are then calculated. These acoustic results are compared to tail rotor loading and thickness noise, and are found to be significant to the overall tail rotor noise generation. Under most helicopter operating conditions, large acoustic pressure fluctuations can be generated due to a series of skewed main rotor tip vortices passing through the tail rotor disk. The noise generation depends strongly upon the helicopter operating conditions and the location of the tail rotor relative to the main rotor. Author

**CALCULATION OF TRANSONIC ROTOR NOISE USING A FREQUENCY DOMAIN FORMULATION**
J. PRIEUR (ONERA, Chatillon-sous-Bagneux, France) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. Research supported by the Ministere de la Defense. refs
(AIAA PAPER 86-1901)

This paper presents a formulation of the prediction of transonic quadrupolar rotor noise in hover by means of a frequency domain method. An application is made to a model rotor. Tests on the computational stability of the method are presented and theoretical results are compared with published experimental data. Noise predictions on rotors with swept-tip blades are made and discussed. Author

**HIGH SPEED ROTOR NOISE DUE TO BLADE LOADING**
R. DASH (Douglas Aircraft Co., Long Beach, CA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. refs
(AIAA PAPER 86-1902)

An equation for the far field radiated sound due to dipole sources, which results from blade loading, is derived using the theories of Lowson (1965) and Ffowcs et. al. (1969). The power spectral density (PSD) of the pressure field in a far field is analyzed. The effects caused by the Doppler shift in the amplitude and in the PSD of load fluctuations are considered. The equation relates the PSD of a time-dependent dipole strength to the PSD of the pressure fluctuation in the distant radiation field. The theory is employed to study fan noise, and a modified form of the Gutin theory of propeller noise is developed. The application of the data to the prediction of helicopter rotor noise and broadband noise is discussed. I.F.

**ROTOR NOISE DUE TO ATMOSPHERIC TURBULENCE INGESTION. II AEROACOUSTIC RESULTS**
R. K. AMIET, J. C. SIMONICH, and R. H. SCHLINKER (United Technologies Research Center, East Hartford, CT) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. refs
(Contract NAS1-17096)
(AIAA PAPER 86-1903)

A computer program for the prediction of noise due to the turbulence of inflow to a propeller or helicopter rotor is extended to the case of nonisotropic turbulence, on the basis of a combined mean flow contraction model and rapid distortion theory. The mean flow distortion is noted to stretch the turbulence, decreasing the velocities along the principal axis of the stretching. In the case of a principal stretching axis lying close to the rotor axis, the distortion acts to decrease the upwash velocities of the rotor; thereby decreasing the noise from levels associated with isotropic turbulence. Acoustic energies are calculated at observer location for several cases, and compared to the turbulence energy as affected by the contraction. O.C.

**APPLICATION OF THE BASELINE ROTONET SYSTEM TO THE PREDICTION OF HELICOPTER TONE NOISE**
R. A. GOLUB (NASA, Langley Research Center, Hampton, VA), D. S. WEIR, and M. B. TRACY (Kentron International, Inc., Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 8 p. refs
(AIAA PAPER 86-1904)

The capabilities of the baseline Rotonet system designed to predict helicopter noise are analyzed. The modules of the system utilized for main and tail rotor geometry and blade section aerodynamic characteristics, for analyses, and for source-to-observer geometry, and atmospheric and ground effects calculations are described; a diagram of the system is provided. The Rotonet system produces axial force, tone noise, and sound pressure level information and a one third octave spectrum related to rotor tone noise and broadband noise sources. Main rotor noise predictions are compared with flight data. It is observed that both sets of data reveal increase loading on the advancing side and decrease loading on the retreating side. The tone noise and sound pressure levels for the first and second harmonics correlate well with the flight data; however, there is only fair agreement for the third harmonics of the sound pressure level. Analysis of the spectra display lower noise levels for higher altitudes and lower speeds. It is noted that the baseline Rotonet system is applicable for predicting performance and noise signatures for the lower harmonics. A phase II Rotonet system for evaluating higher harmonics is being developed. I.F.

**SOUND TRANSMISSION THROUGH DOUBLE PANEL CONSTRUCTIONS LINED WITH ELASTIC POROUS MATERIALS**
J. S. BOLTON and E. R. GREEN (Purdue University, West Lafayette, IN) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 13 p. refs
(AIAA PAPER 86-1907)

Attention is given to a theory governing one-dimensional wave motion in elastic porous materials which is capable of reproducing experimental transmission measurements for unfaced polyurethane foam layers. Calculations of the transmission loss of fuselage-like foam-lined double panels are presented and it is shown that the foam/panel boundary conditions have a large effect on the panel performance; a hybrid arrangement whereby the foam is bonded directly to one panel and separated from the other by a thin air gap appears to be the most advantageous under practical circumstances. With this configuratiom, the mass-air-mass resonance is minimized and increased low-frequency performance is offered. K.K.

**THE EFFECT ON RADIATED NOISE OF NON-ZERO PROPELLER ROTATIONAL PLANE ATTITUDE**
W. M. DOBRZYNSKI (DFVLR, Institut fuer Entwurfs-Aerodynamik, Brunswick, West Germany) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 15 p. Research supported by the Bundesministerium fuer Verkehr, FAA and BMFT. refs
(AIAA PAPER 86-1926)

Subsequent to CAEP's decision to introduce a new noise certification procedure, a joint attempt was made by the FAA and DFVLR to quantitatively determine the influence of a nonzero propeller-disk attitude on the resulting noise; tests were conducted with the German Dutch Wind Tunnel (DNW) in its aeroacoustic mode. It was found that the effect of propeller disk-plane attitude on maximum overall A-weighted noise levels can be related to a steady-state Mach number effect for the propeller operating at subsonic helical blade-tip (HBT) Mach-numbers exceeding a value of 0.7. For HBT Mach-numbers significantly below 0.7, additional noise radiation due to the unsteady flow properties within one propeller revolution dominate the overall A-weighted noise levels. K.K.

### COUNTER-ROTATING PROPELLER NOISE DIRECTIVITY AND TRENDS

P. J. W. BLOCK (NASA, Langley Research Center, Hampton, VA), R. J. KLATTE (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT), and P. M. DRUEZ (Douglas Aircraft Co., Long Beach, CA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 12 p. refs
(AIAA PAPER 86-1927)

The effects of power loading on the far field noise spectra and directivity of counter-rotating propellers (CRP) were studied using a model scale SR-2 propeller in a low-speed anechoic wind tunnel. Approximately 264 far field noise measurements were obtained for each CRP configuration (pusher and tractor) and operating conditions covering from 30 to 140 deg to the flight direction and up to 340 deg circumferentially. Data indicated that the CRP tractor produced higher levels in the second and third harmonics which propagated axially; in effect, the noise exposure time increased over that of a single single-rotation propeller. The effects of pylon-to-propeller spacing, type of pylon attachment and reduced rear-blade row radius are considered and it is found that the 0.3 chord radial pylon produces less additional noise than the 0.1 chord radial pylon and that the 0.2 chord tangential pylon is the quietest pusher configuration. K.K.

### EXPERIMENTAL RESULTS OF THE NOISE RADIATION OF PROPELLERS IN NON-UNIFORM FLOWS

I. U. BORCHERS, R. SCHOLTEN (Dornier GmbH, Friedrichshafen, West Germany), and B. W. GEHLHAR (DFVLR, Brunswick, West Germany) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 13 p. refs
(Contract BMFT-LKV-8330)
(AIAA PAPER 86-1928)

The noise radiation of propellers operating in airfoil or fuselage wakes is studied via 1:7 model-scale wind-tunnel testing. The effect of the wake is assessed for a variety of propeller parameters and flow data and the influence of reflecting surfaces in the propeller near-field (given by aircraft T-type tail units) is investigated. The wake results in an increase in noise generation occurring primarily at the higher harmonics and in the upstream direction. Tests with the reflecting surfaces reveal that T-type horizontal tails may effect both the far-field noise levels for rear-mounted propellers and the upstream near-field noise close to the rear fuselage section. K.K.

### PUSHER PROPELLER NOISE DIRECTIVITY AND TRENDS

P. J. W. BLOCK (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 12 p. refs
(AIAA PAPER 86-1929)

The effects of pylon wake interaction on far-field propeller noise are studied using a model scale SR-2 propeller in a low-speed anechoic wind tunnel. The variation in the pusher noise penalty with axial angle theta and circumferential angle phi is compared to that of the tractor noise penalty; and the former exhibits minima occurring in the propeller plane and maxima occurring toward the propeller axis. The magnitude of the pusher installation noise penalty decreased with in increase in shaft horsepower and tip Mach number. Directivity comparisons revealed that both a noise reduction and a directivity pattern change resulted when the pylon was moved farther from the propeller. Noise emerging from the wake interaction was distinguished from that of the propeller by means of a modal decomposition. K.K.

### PREDICTED AND MEASURED STRAIN RESPONSE OF RECTANGULAR PANELS DUE TO ACOUSTIC LOADING

L. A. ROUSSOS, K. E. HEITMAN, and C. E. RUCKER (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p. refs
(AIAA PAPER 86-1931)

The objective of the research described in this paper is to assess the accuracy of classical linear acceleration/strain prediction theory for flat, rectangular panels excited by low level, acoustic plane waves. Predictions for both aluminum and laminated composite panels were based on the Ritz method using an orthotropic, multi-mode analysis with rotational springs on the boundaries. The measured natural frequencies and critical damping ratio of the panels were empirial inputs to the model. The comparison between measured and predicted acceleration was very good. Although a factor of three bias error was found between measured and predicted strains, the model was good for predicting the trends in the spatial variation in strain across the panel. Author

### THE NEAR AND FAR ACOUSTIC FIELDS OF BROADBAND SHOCK ASSOCIATED NOISE

C. K. W. TAM (Florida State University, Tallahassee) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 15 p. refs
(Contract NAG1-421)
(AIAA PAPER 86-1943)

A stochastic model theory is presented which suggests that the broadband shock associated noise of supersonic jets is generated by the weak interaction between downstream propagating large turbulence structures and the quasiperiodic shock cells in the jet plume The large turbulence structures are modelled by a superposition of the intrinsic instability waves of the mean flow of the jet, and the quasiperiodic shock cells are broken down into time-independent waveguide modes of the jet flow using multiple scales expansion. The observed broadband shock associated noise consists of a superposition of the spectra generated by the different waveguide modes. Starting from the equations of motion of a compressible fluid, formulas for calculating the far field and near field noise are developed. Good general agreement is found with previous results. R.R.

### HIGH SPEED FLIGHT EFFECTS ON SHOCK ASSOCIATED NOISE

W. H. BROWN, K. K. AHUJA, and C. K. W. TAM (Lockheed-Georgia Co., Marietta) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 8 p. Research sponsored by the Lockheed-Georgia Co.
(AIAA PAPER 86-1944)

An experimental study was conducted to evaluate the effects of high speed flight on shock associated noise. This study was conducted in the Lockheed anechoic wind tunnel using flow from a 4-inch diameter pipe for flight simulation and a 0.4-inch diameter flow to simulate the supersonic jet. Acoustic measurements were made in the farfield and within the flight simulation flow for simulated flight Mach numbers up to 0.8 for unheated jet Mach numbers of 1.42 and 1.49. It is shown that the peak frequency of the shock-associated noise decreases with increasing flight speed. Similarly, shock-associated broadband noise magnitude was observed to increase with flight velocity. Author

**SHOCK NOISE FROM SUPERSONIC JETS IN SIMULATED FLIGHT TO MACH 0.4**

T. D. NORUM and J. G. SHEARIN (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. refs

(AIAA PAPER 86-1945)

Simulated flight experiments to Mach 0.4 on underexpanded jets show that flight has only minor effects on both the shock structure and shock associated noise. Although screech modes that do not exist statically become dominant at the higher flight speeds, the screech amplitudes and directivity as well as the broadband shock noise amplitudes remain relatively constant as the forward speed is increased. The change in wavelength due to flight on both shock noise components are predicted well from existing theories of shock noise. Author

**AEROACOUSTICS OF CONTOURED PLUG-NOZZLE SUPERSONIC JET FLOWS**

D. S. DOSANJH (Syracuse University, NY) and I. S. DAS (Pennsylvania State University, Sharon) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 17 p. refs

(Contract NAG1-129)

(AIAA PAPER 86-1946)

Experimental investigations of the acoustic far-field, the shock associated noise, and the characteristics of the repetitive shock structure of supersonic jet flows issuing from a plug-nozzle having an externally expanded contoured plug with a pointed termination, operated at a range of supercritical pressure ratios of 2.0 to 4.5 are reported. The supersonic jet flow from the contoured plug is shown to be shock-free and virtually wakeless at a pressure ratio of 3.60 (flow Mach number, 1.49). By comparison with the noise characteristics of underexpanded jet flows from an equivalent convergent nozzle, substantial reductions in the total (mixing and the shock associated) noise levels are obtained when the contoured plug nozzle is operated either in the fully-expanded (shock-free) mode or in the over- and the underexpanded modes. Author

**TONE-LIKE NOISE FROM AN ISOLATED TWO DIMENSIONAL AIRFOIL**

S. AKISHITA (Mitsubishi Electric Corp., Amagasaki, Japan) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs

(AIAA PAPER 86-1947)

The frequencies of a tone-like noise consisting of a series of tones radiating from isolated two-dimensional NACA 0015 airfoils are investigated, in addition to the effect of a trip wire in the boundary layer. It is found that the index in the power law of the tone-like noise is far less than that of the broadband noise, and that the tone frequencies increase with flow velocity and decrease with chord length. The results show that the tone-like noise relates to linear instability of the boundary layer on the pressure surface. Based on flow turbulence measurements in the boundary layer, and flow visualization by an oil film technique, a new model is proposed of a self-excited feedback loop consisting of the turbulent boundary layer downstream of a laminar separation bubble, and the wake flow near the trailing edge. R.R.

**A86-45435#**

**BROAD BAND NOISE FROM AN ISOLATED TWO DIMENSIONAL AIRFOIL**

S. AKISHITA and K. OHTSUTA (Mitsubishi Electric Corp., Amagasaki, Japan) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. refs

(AIAA PAPER 86-1948)

The turbulence noise characteristics from an isolated two-dimensional airfoil immersed in low turbulence uniform flow are investigated for axial-flow fans at Reynolds numbers applicable to full scale rotors. The far-field noise is characterized as broadband noise (BBN) and tone-like high-frequency noise. The BBN is found to predominate over the tone-like noise in flow and wing geometry conditions of low camber, small thickness ratio, and low incidence flow angle. The BBN overal intensity is proportional to the 5th or 6th power of the flow velocity, and is related to the characteristics of the boundary layer near the trailing edge. The BBN spectrum level and peak frequency are found to depend on the wing geometry parameters and the flow characteristics. The BBN directivity resembles a point dipole, and the surface dipole strength distribution of the BBN along the chordwise direction is shown to increase from the leading edge towards the trailing edge. R.R.

**A86-45443#**

**ACTIVE MINIMISATION OF ACOUSTIC POTENTIAL ENERGY IN HARMONICALLY EXCITED CYLINDRICAL ENCLOSED SOUND FIELDS**

A. J. BULLMORE, P. A. NELSON, and S. J. ELLIOTT (Southampton, University, England) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p. refs

(AIAA PAPER 86-1958)

Quadratic optimization theory is used to apply active noise control methods to the control of cylindrical enclosed sound fields which are harmonically excited due to the structural response of a surrounding thin cylindrical shell excited by two harmonic point forces. Using ten secondary control sources, it is shown that reductions of up to 5.7 dB in the total time averaged acoustic potential energy in the enclosure can be realized in a cylinder with dimensions typical of a 50-seat propeller driven aircraft, and being driven at a frequency typical of propfan blade passage frequency. It is noted, however, that the model may not give reliable predictions of reductions possible in real aircraft due to the highly selective nature of the coupling between structural and acoustic modes in the model used. R.R.

**ADVANCED TURBOPROP AIRCRAFT NOISE ANNOYANCE - A REVIEW OF RECENT NASA RESEARCH**

D. A. MCCURDY, J. D. LEATHERWOOD (NASA, Langley Research Center, Hampton, VA), and K. P. SHEPHERD (Bionetics Corp., Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 14 p. refs

(AIAA PAPER 86-1959)

Passenger and community response to advanced turboprop aircraft noise are studied. Four experiments were conducted utilizing an aircraft noise synthesis system, an exterior effects room, an anechoic listening room, and a Space Station/aircraft acoustic apparatus; the experimental conditions and procedures for the psychoacoustic studies are described. The community noise studies involved evaluating the effects of various tonal characteristics on annoyance. It was observed that the frequency envelope shape did not effect annoyance; however, the interaction of the fundamental frequency with tone-to-broadband noise ratio did have a large effect on annoyance. The effects of low frequency tones, turbulent boundary layer noise, and tonal beats on passenger annoyance are investigated. The data reveal that passenger annoyance is greater for a given level of boundary layer noise when tones are at levels sufficient to increase the overall sound pressure level within the cabin. The annoyance response of an advanced turboprop and a conventional aircraft are compared. It is determined that the flyover noise level for the turboprop aircraft is not more annoying than that of a conventional aircraft. I.F.

**A86-45445#**

**AIRCRAFT NOISE MEASUREMENT - ALTERNATIVES TO THE STANDARD 1-2 METRES MICROPHONE HEIGHT**

M. J. T. SMITH (Rolls-Royce, Ltd., Derby, England) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 12 p. refs

(AIAA PAPER 86-1960)

The results of tests carried out on alternative microphone configurations are presented and related to previous work. Consideration is given to (1) a 'reference' microphone flush in the hard test bed surface, (2) the international standard 1.2-m height grazing incident system over grass, (3) an inverted microphone with its diaphragm 15 mm above and at 3/4 radius on a 40-cm diameter heavy metal plate, and (4) a 10-m height grazing incidence microphone over grass. It is concluded that the alternative ground-based microphone presently being considered by ICAO for propeller-powered light aircraft noise certification is technically advantageous. It is recommended that comparative measurements be made between the 1.2 m standard and alternative ground-based systems to provide data as close to pressure-doubled as possible and to define the corrections that will be necessary for adjustment of ground-based data to average 1.2-m levels. K.K.

**A86-45447#**

**BROADBAND NOISE - ITS PREDICTION AND LIKELY IMPORTANCE FOR ADVANCED PROPFANS**

K. KNOWLES (Royal Military College of Science, Shrivenham, England) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs

(AIAA PAPER 86-1963)

A comparison of published experimental results and analytical results on broadband noise evaluations for rotating many-bladed propellers has been conducted to assess the importance of broadband noise in the perceived noise (PN) level of propfans. It is concluded that, in cruise conditions, the tone noise dominates the broadband noise of typical propfans by 8 dB. As the speed is reduced, and the values of forward Mach number and helical tip Mach number are reduced, the tones fall more rapidly than the broadband component until, at approach conditions, the broadband noise is dominant by 8 to 16 PNdB. A survey of the state-of-the-art of broadband noise prediction suggests that the broadband noise can be predicted to within 5 dB. I.S.

**A86-45448#**

**BROADBAND PROPELLER NOISE PREDICTION IN THE PLANE OF THE ROTOR**

S. A. L. GLEGG (Florida Atlantic University, Boca Raton, FL) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 8 p. refs

(AIAA PAPER 86-1964)

The unsteady thickness noise of Hawkins (1978) is shown to account for the discrepancy between the predicted broadband rotor noise, thought to consist of trailing edge and unsteady lift noise, and the observed plane rotor noise. A generalized formulation for the sound radiation of blades of finite span in linear motion is presented, and comparison of the theoretical results with noise measurements from a model scale rotor operating in a high level of turbulence demonstrates the importance of the present phenomenon. The power spectral density of the radiated acoustic pressure is also formulated in terms of the wavenumber spectrum of the inflow turbulence and blade response functions. R.R.

**A86-45451#**

**AN EXPERIMENTAL AND THEORETICAL INVESTIGATION OF THE PROPAGATION OF SOUND WAVES THROUGH A TURBULENT BOUNDARY LAYER**

M. SALIKUDDIN, C. K. W. TAM, R. H. BURRIN, and J. A. GALLAGHER (Lockheed-Georgia Co., Marietta) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 17 p. Research supported by Lockheed Independent Research and Development Program. refs

(AIAA PAPER 86-1968)

An experiment was carried out to determine the attenuation of sound crossing a turbulent boundary layer over a flat plane attached on one side of a high-speed square jet at Mach numbers approaching 0.8. Substantial transmission losses were measured and were found to increase with Mach number, frequency, and forward direction. To estimate the acoustic transmission loss as turbopropeller sound waves are transmitted through a turbulent boundary layer (TBL) on the surface of the fuselage, a theoretical model was developed in which the effect of refraction due to TBL velocity and density gradients are taken into account. It is shown that the effect of viscosity on the acoustic transmission loss depends strongly on the frequency of the sound wave and on the location relative to the propfan. Good agreement was found between the theoretical model and experimental results. K.K.

**MID-FIELD AND FAR-FIELD CALCULATIONS OF BLADE-VORTEX INTERACTIONS**

A. R. GEORGE and A. S. LYRINTZIS (Cornell University, Ithaca, NY) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 16 p. Research supported by the McDonnell Douglas Helicopter Co. refs

(AIAA PAPER 86-1854)

A study is made of mid-field and far-field noise generated by transonic Blade-Vortex Interactions (BVI) typical of helicopter main rotor noise. The VTRAN2 small disturbance, two-dimensional, transonic flow code which includes convected vorticity was used to compute near and mid-field flow field information. Because of mesh size limitations this information is restricted to the mid-field and does not give the desired far field and three-dimensional information. A method of extending the solutions to the far field in three dimensions is developed based on Kirchhoff's solution to the linear flow outside a surface S inclosing the nonlinear near field. A number of the directionality aspects of BVI noise are explained in terms of the propagation characteristics of the waves. The relation of unsteady 'Type C' shock motion on the airfoil to far field sound is shown. The farfield radiation was affected only weakly by Mach number in the transonic range but airfoil thickness, shape, and miss distance were found to be important. Author

**CONCEPTS FOR REDUCTION OF BLADE-VORTEX INTERACTION NOISE**

J. C. HARDIN (NASA, Langley Research Center, Hampton, VA) and S. L. LAMKIN (Kentron International, Inc., Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 7 p. refs

(AIAA PAPER 86-1855)

A model is developed to determine the critical parameters that control noise generation by blade-vortex interaction (BVI). The equations for evaluation BVI are derived. The analysis of BVI using the model reveals that the interaction is dependent on incoming vortex strength, blade lift, the interaction length, and the miss distance of the interaction. Several methods for reduction of the noise source are proposed. I.F.

**A86-45478*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.

**SURFACE PRESSURE MEASUREMENT DURING LOW SPEED TWO-DIMENSIONAL BLADE-VORTEX INTERACTION**

E. R. BOOTH, JR. (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 7 p. refs

(AIAA PAPER 86-1856)

Unsteady blade surface pressures were measured during two-dimensional blade-vortex interaction. A periodically generated vortex filament interacted with a blade model instrumented over the first 20 percent of the blade surface. Analysis of data confirm the leading edge nature of BVI and show the amplitude of the interaction to be a strong function of blade-to-vortex spacing. Lift perturbation time histories were computed and are used to examine details of the encounter process. Author

**A86-45479*#** United Technologies Research Center, East Hartford, Conn.

**ROTOR NOISE DUE TO ATMOSPHERIC TURBULENCE INGESTION. I - FLUID MECHANICS**

J. C. SIMONICH, R. K. AMIET, R. H. SCHLINKER (United Technologies Research Center, East Hartford, CT), and E. M. GREITZER (MIT, Cambridge, MA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 15 p. refs
(Contract NAS1-17096)
(AIAA PAPER 86-1857)

In the present analytical procedure for the prediction of helicopter rotor noise generation due to the ingestion of atmospheric turbulence, different models for turbulence fluid mechanics and the ingestion process are combined. The mean flow and turbulence statistics associated with the atmospheric boundary layer are modeled with attention to the effects of atmospheric stability length, windspeed, and altitude. The turbulence field can be modeled as isotropic, locally stationary, and homogeneous. For large mean flow contraction ratios, accurate predictions of turbulence vorticity components at the rotor face requires the incorporation of the differential drift of fluid particles on adjacent streamlines. O.C.

**A86-45481#**

**PREDICTION OF STRUCTURE-BORNE NOISE, BASED ON THE FINITE ELEMENT METHOD**

G. SENGUPTA, A. E. LANDMANN, A. MERA, and T. F. YANTIS (Boeing Co., Seattle, WA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p. refs
(AIAA PAPER 86-1861)

A coupled structural-acoustic finite-element method was selected as a means of predicting and controlling structure-borne noise in propeller-powered aircraft. An existing finite-element program was adapted for structural-acoustic analysis by redefining certain input parameters and by imposing certain restrictions on two of the three orthogonal components of the structural displacement variable. In order to verify the predictions of this modified finite-element program, closed-form solutions were developed for predicting the structural-acoustic responses of two- and three-dimensional cylinders enclosing an acoustic medium. When the coupled structural-acoustic finite-element equations were solved in terms of the physical coordinates, good agreement was found between the two methods. A more cost-effective approach, based on modal analysis was developed as well as an uncoupled approach. K.K.

**A FEASIBILITY STUDY ON THE NUMERICAL MODELING OF INTERIOR NOISE FIELDS**

A. L. ABRAHAMSON (COMTEK, Grafton, VA) and C. A. POWELL (NASA, Langley Research Center, Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p.
(AIAA PAPER 86-1862)

New developments in electronics and computer control have made active methods of noise suppression feasible. To date, however, active methods of noise control have been applied principally in geometrically uniform spaces with localized sound sources. The purpose of this paper is to demonstrate how finite element techniques may be used to model sound fields and active control inside geometrically complex spaces with non-uniform acoustic boundaries and multiple spatially separated sources. A closed-form solution is derived for the case of a one-dimensional tube with a vibrating piston at each end. Results are compared with finite element solutions and the problem is then generalized to two-dimensions with non-uniform geometry and non-uniform acoustic boundaries. Author

(Contract NAG1-58)
(AIAA PAPER 86-1864)

Two boundary element formulations of acoustical behavior exist; the Direct Boundary Element Methods (DBEM) based on the Helmholtz Integral Equations and the Indirect Boundary Element Methods (IBEM) based on Huygen's Principle. In this investigation, both methods are implemented utilizing a simple linear superparametric element. In addition the IBEM is studied using a quadratic isoparametric element. The accuracy and relative efficiency of the various techniques are examined. In order to properly model aircraft interior cavities the additional capability to model wall treatments and internal point sources is added to the methods. The procedures are verified for several well-understood cavity problems. The relative merits of each boundary element method and the finite element method are examined. Author

**ON THE SCREECH TONES OF SUPERSONIC RECTANGULAR JETS**

C. K. W. TAM (Florida State University, Tallahassee) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 9 p. refs
(Contract NAG1-421)
(AIAA PAPER 86-1866)

The shock cell structure and screech tone frequencies of nonaxisymmetric supersonic jets are examined. A linear shock cell model that utilizes a vortex sheet as the mixing layer of the jet is developed in order to estimate the characteristics of the shock structures and tone frequencies. Eigenvalue problems for rectangular and elliptical jets are solved, and shock cell structure solutions for the jets are derived. The shock cell spacings calculated with the model are compared to the data of Powell (1953) and Hammitt (1961); good correlation is obtained over a wide range of Mach numbers. The shock cell spacing formula is applied to the computation of screech tone frequencies of rectangular jets. It is observed that the calculated frequencies agree with the measurements of Powell and Krothapalli et. al. (1986) for the Mach number range 1.15-1.80. I.F.

**ACOUSTIC PROPERTIES ASSOCIATED WITH RECTANGULAR GEOMETRY SUPERSONIC NOZZLES**

J. M. SEINER, J. C. MANNING (NASA, Langley Research Center, Hampton, VA), and M. K. PONTON (Kentron International, Inc., Hampton, VA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 13 p. refs
(AIAA PAPER 86-1867)

Acoustic property experiments have been conducted to ascertain the behavior of rectangular geometry supersonic nozzles whose throat aspect ratios vary over a 2.0-7.6 range, and whose three partial sidewall geometries range from full to 75-percent cutback. The tests employed unheated air at static conditions for nozzle Mach numbers of 1.35-1.86. It is found that sonic fatigue failures are possible at certain partial sidewall geometries and high nozzle aspect ratios. Unlike axisymmetric supersonic nozzles, shock noise dominates both the rear and forward arc for throat aspect ratio cases greater than 5.6. Jet screech frequency was adequately predicted with a simple vortex sheet model. O.C.

**THE NOISE EMITTED BY TURBULENT JETS IN CLOSE PROXIMITY TO SOLID SURFACES**

P. W. CARPENTER (Exeter, University, England) and C. PARSONS AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 10 p. Research supported by the British Petroleum Co., PLC and SERC. refs

(AIAA PAPER 86-1869)

The present calculations of basic directivity patterns for randomly oriented longitudinal and lateral quadrupole types near a rigid plane indicate substantial differences between the two types. By applying Lighthill's (1954) acoustic analogy and extending the Ribner (1969) modeling method for acoustic sources, the basic directivity pattern of the sound generated by a unit volume of jet-type shear layer turbulence near an infinite grid plane is calculated and found to be very different from the corresponding elliptical one obtained by unit volume of free-field shear layer turbulence. The theory is presently applied to an actual turbulent shear flow, in the form of a plane, two-dimensional wall jet, basic aeroacoustic predictions are thereby obtained. O.C.

**ROTOR-STRUT INTERACTION NOISE OF A MODEL FAN**

Y. NAKAMURA, K. ISOMURA, and H. KODAMA (Ishikawajima-Harima Heavy Industries Co., Ltd., Tokyo, Japan) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 8 p. refs

(AIAA PAPER 86-1871)

Rotor-strut interaction noise was studied by using modern turbofans with different strut configuration. It was shown that the potential perturbation field induced by fat strut has important effect on the generation of blade passing frequency tone which is usualy designed to be cut off by selecting appropriate stator vane number. This fact was further confirmed by the induct acoustic mode measurement. Semi-actuator disk approach for rotor blade row combined with singularity method well predicted the static pressure perturbation field. Quasi-steady calculation of rotor unsteady aerodynamic force due to down stream perturbation was also obtained as an interim step for the interaction noise estimation. Author

(Contract NAG3-357)

(AIAA PAPER 86-1872)

An analysis is developed for the noise generated by the interaction of a rotor viscous wake with a cascade of swept stator vanes. The stator vanes span a channel formed by infinite parallel walls and containing a subsonic mean flow. High frequency interactions, for which the noise generation is concentrated at the vane leading edge, are considered. The analysis utilizes a superposition of the solution to the isolated stator vane problem, presented in an earlier paper, to develop an approximate solution to the cascade problem. The rotor wake model includes the features of wake circumferential lean and a linear spanwise variation of the magnitude of the wake deficit velocity. Calculations are presented which show that, for rotor wakes with moderate circumferential lean, stator sweep produces substantial reductions in noise level. The vane sweep must be oriented to enhance the phase lags along the vane leading edge produced by wake lean. The noise levels are found to be fairly insensitive to spanwise variations in the wake deficit. Author

**INFLUENCE OF AIRFOIL CAMBER ON CONVECTED GUST INTERACTION NOISE**

M. R. MYERS and E. J. KERSCHEN (Arizona, University, Tucson) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 11 p. refs

(Contract NAG3-357)

(AIAA PAPER 86-1873)

This paper investigates the effect of airfoil steady loading on the sound generated by the interaction of an airfoil with a convected disturbance. A previous theory, which included only the incidence angle contribution to the mean loading, is extended to include camber. The theory is based on a linearization of the Euler equations about a nonuniform, 0(1) Mach number subsonic mean flow. The discussion concentrates on the case of a slightly cambered airfoil at small incidence angle, interacting with a gust whose wavelength is short compared to the airfoil chord. The small parameter representing the amount of camber and incidence, and the large parameter representing the ratio of airfoil chord to disturbance wavelength, are utilized in a singular perturbation solution to the governing equations. Acoustic power calculations reveal that the amount of sound generated increases significantly with increased loading. More importantly, it is shown that the radiated acoustic power correlates very well with the strength of the mean flow around the leading edge. Author

**DEVELOPMENT OF AN IMPULSIVE NOISE SOURCE TO STUDY THE ACOUSTIC REFLECTION CHARACTERISTICS OF HARD-WALLED WIND TUNNELS**

M. SALIKUDDIN, R. H. BURRIN, K. K. AHUJA, and H. W. BARTEL (Lockheed-Georgia Co., Marietta) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 12 p.

(Contract NAS3-24339)

(AIAA PAPER 86-1887)

Two impulsive sound sources, one using multiple acoustic drivers and the other using a spark discharge were developed to study the acoustic reflection characteristics of hard-walled wind tunnels, and the results of laboratory tests are presented. The analysis indicates that though the intensity of the pulse generated by the spark source was higher than that obtained from the acoustic source, the number of averages needed for a particular test may require an unacceptibly long tunnel-run time due to the low spark generation repeat rate because of capacitor charging time. The additional hardware problems associated with the longevity of electrodes and electrode holders in sustaining the impact of repetitive spark discharges, show the multidriver acoustic source to be more suitable for this application. R.R.

**ACOUSTIC REFLECTION CONTAMINATION MEASUREMENTS IN THE 16-FOOT NASA LANGLEY TRANSONIC WIND TUNNEL**

R. H. BURRIN, M. SALIKUDDIN, K. K. AHUJA, and H. W. BARTEL (Lockheed-Georgia Co., Marietta) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 12 p. refs

(Contract NAS3-24339)

(AIAA PAPER 86-1888)

The Propfan Test Assessment (PTA) contract, awarded recently to Lockheed by the NASA-Lewis Research Center, required a comprehesive series of near field acoustic measurements. These were to use transducers mounted on the surfaces on a one-ninth scale model of the Gulfstream G-II aircraft, modified to the PTA single propfan testbed configuration. The 16-foot Transonic Wind Tunnel at the NASA Langley Research Center was chosen as the facility to be used for these model acoustic tests. Since the tunnel was hard-walled, it is not clear to what extent the propfan noise signals, reaching the various transducers, might be contaminated by reflections from the walls. A Multidriver Acoustic Source was built, and using an impulse and time domain averaging technique, the reflection contaminations in the wind tunnel were measured at selected microphone locations. Results of the investigations of near field measurements exists, due to reflections from the hard walls of the wind tunnnel. Author

**THEORETICAL PREDICTION OF SINGLE ROTATION PROPELLER NOISE**

A. B. PARRY (Rolls-Royce, Ltd., Derby, England) and D. G. CRIGHTON (Cambrige, University, England) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 13 p. refs
(AIAA PAPER 86-1891)

Expressions for the harmonic components of propeller noise are derived in a novel way and shown to provide excellent agreement with measured data. Using asymptotic techniques the complex expressions for the radiated sound are reduced to provide simple results which do not involve numerical integration of Bessel functions but retain the main parameteric dependences. Comparison with the detailed predictions shows that the asymptotic expressions are extremely accurate, in terms of both absolute level and parametric trends. The asymptotics are used to explain clearly and simply many published results on the noise characteristics of propellers. In addition it is shown how the acoustic benefits of blade sweep and chordwise noncompactness can be predicted using asymptotic techniques. Author

**A STUDY OF THE ROTOR/ROTOR INTERACTION TONES FROM A CONTRA-ROTATING PROPELLER DRIVEN AIRCRAFT**

A. J. BRADLEY (Rolls-Royce, Ltd., Derby, England) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 8 p.
(AIAA PAPER 86-1894)

A series of noise measurements have been performed on a contra-rotating propeller driven aircraft. Both near and far-field data have been obtained from which it is possible to extract the tonal noise resulting from the aerodynamic interaction between the two propeller rows by a tone splitting technique. Data from these tests are presented and an existing contra-rotating propeller theory is used in a novel way to identify the dominant source component and its radial location on the blades. Author

**EFFECT OF A WIND TUNNEL ON THE ACOUSTIC FIELD FROM VARIOUS AEROACOUSTIC SOURCES**

M. MOSHER (NASA Ames Research Center, Moffett Field, CA) AIAA, Aeroacoustics Conference, 10th, Seattle, WA, July 9-11, 1986. 16 p.
(AIAA PAPER 86-1897)

The effects of the walls of an enclosed test section wind tunnel on measurements of sound fields from various sources has been studied. The acoustic field from a known source in a wind tunnel has been modeled as an infinitely long duct with constant cross section. The model was solved with a numerical panel technique in a control volume near the source, and matched to an outer analytic solution. Several sample problems were studied in a rectangular duct with and without flow. The results indicate that the presence of the duct affects the acoustic field, and that small changes in the product of duct cross dimensions and the source wave number can change the acoustic field significantly. It is also shown that, for low-frequency helicopter rotor harmonic noise, measured in typical wind tunnel rotor tests, the sound levels beyond one rotor diameter from the hub are unreliable indications of the free-field sound levels. **INVESTIGATION OF THE AERODYNAMIC PERFORMANCE AND NOISE CHARACTERISTICS OF A 1/5TH SCALE MODEL OF THE DOWTY ROTOL R212 PROPELLER**

W. J. G. TREBBLE 15 Nov. 1983 35 p
(RAE-TM-AERO-1983; BR90678; ESA-86-97104) Avail: NTIS HC A03/MF A01

The four-bladed Dowty Rotol R212 propeller (NACA 16 sections) was studied at 1/5th scale (0.7 m diameter) in 1.5 m acoustic tunnel. Propeller power absorption and thrust were measured over a range of rotational speeds up to 8000 rev/min at mainstream speeds from 15 to 60 m/sec for a range of blade settings. Slipstream wake surveys show outward movement of the position of the peak pressure as propeller loading is increased. Noise analysis demonstrates the predominance of multiple tones whose number and intensity increase with helical-tip Mach number. An empirical formula shows that the fundamental tone sound pressure level varies with tip speed and power loading in an identical manner to that observed on an ARA-D section propeller. ESA

**NOISE PREDICTIONS OF A HIGH BYPASS TURBOFAN ENGINE USING THE LOCKHEED NEAR-FIELD NOISE PREDICTION PROGRAM**

J. W. RAWLS, JR. Jul. 1986 71 p
(Contract NAS1-18000)
(NASA-CR-178146; NAS 1.26:178146) Avail: NTIS HC A04/MF A01 CSCL 20A

The prediction of engine noise during cruise using the Near-Field Noise Prediction Program developed by Lockheed is examined. Test conditions were established which simulate the operation of a high bypass turbofan engine under a wide range of operating conditions. These test conditions include variations in altitude, flight Mach number and thrust setting. Based on the results of noise prediction made using the Lockheed program, an evaluation of the impact of these test conditions on the overall sound pressure level(OASPL)and the one-third octave band spectra is made. An evaluation of the sensitivity of flight condition parameters is also made. The primary noise source from a high bypass turbofan was determined to be fan broadband shock noise. This noise source can be expected to be present during normal cruising conditions. When present, fan broadband shock noise usually dominates at all frequencies and all directivity angles. Other noise sources of importance are broadband shock noise from the primary jet, fan noise, fan mixing noise and turbine noise. Author

**A NEW VERSION OF THE HELICOPTER AURAL DETECTION PROGRAM, ICHIN**

A. W. MUELLER, C. D. SMITH (PRC Kentron, Inc., Hampton, Va.), K. P. SHEPHERD (Bionetics Corp., Hampton, Va.), and B. M. SULLIVAN Jul. 1986 8 p
(NASA-TM-87745; NAS 1.15:87745) Avail: NTIS HC A02/MF A01 CSCL 20A

NASA Langley Research Center personnel have conducted an evaluation of the helicopter aural detection program I Can Hear It Now (ICHIN version-5). This was accomplished using flight noise data of five helicopters, obtained from a joint NASA and U.S. Army acoustics measurement program. The evaluation consisted of presenting the noise data to a jury of 20 subjects and to the ICHIN-5 program. A comparative study was then made of the

detection distances determined by the jury and predicted by ICHIN-5. This report presents the changes made in the ICHIN-5 program as a result of this comparative study. The changes represent current psychoacoustics and propagation knowledge.

C. WEIKERT Jan. 1986 19 p In SWEDISH; ENGLISH summary
(FOA-C-50033-H2; ISSN-0347-7665; ESA-86-97241) Avail: NTIS HC A02/MF A01

About 300 references on auditory localization were reviewed. Detection of low frequency sound is discussed. Literature shows that man's ability to localize sounds by auditory detection is good. Vision may also assist the auditory localization. A helicopter approaching at a great height (1500 feet) is easier to localize than a low flying one (200 feet), and a helicopter heading into the wind is significantly more difficult to localize than one having the wind astern, even when the wind speed is low. When background conditions are quiet, one may expect to detect a noisy helicopter at a distance over 13 km.

**ACOUSTIC TREATMENT OF THE NASA LANGLEY 4- BY 7-METER TUNNEL: A FEASIBILITY STUDY**
J. C. YU and A. L. ABRAHAMSON (Comtek, Grafton, Va.) Aug. 1986 38 p
(NASA-TP-2563; L-16037; NAS 1.60:2563) Avail: NTIS HC A03/MF A01 CSCL 20A

A feasibility study for upgrading the NASA Langley 4- by 7-Meter Tunnel so that it may be used for aeroacoustic research related to helicopters is described. The requirements for noise research leading to the design of the next generation of helicopters impose a set of acoustic test criteria that no existing wind tunnel in the United States can presently meet. Included in this feasibility study are the following considerations: (1) an evaluation of general wind-tunnel requirements and desired tunnel background noise levels for helicopter aeroacoustic research; (2) an assessment of the present acoustic environment for testing model rotors; (3) a diagnostic investigation of tunnel background noise sources and paths; (4) acoustic treatment options for tunnel background noise reduction and a trade-off study between these options; (5) an engineering feasibility assessment of the selected option; and (6) an integrated analysis of study components and recommendations of treatment for an approach to meet the tunnel background noise reduction goal. It is concluded that the Langley 4- by 7-Meter Tunnel is a fundamentally suitable facility for helicopter aeroacoustic research. It is also concluded that acoustic treatment of this facility for meeting the required tunnel background noise goal can be accomplished technically at reasonable risk and cost.

The development of a high speed propeller noise prediction code at Langley Research Center is described. The code utilizes two recent acoustic formulations in the time domain for subsonic and supersonic sources. The structure and capabilities of the code are discussed. Grid size study for accuracy and speed of execution on a computer is also presented. The code is tested against an earlier Langley code. Considerable increase in accuracy and speed of execution are observed. Some examples of noise prediction of a high speed propeller for which acoustic test data are available are given. A brisk derivation of formulations used is given in an appendix.

As part of an investigation to develop measurement techniques for structureborne noise, three modal surveys have been conducted on an OV-10A aircraft and the results have been presented. The purpose of the modal surveys was to identify suitable locations for mounting accelerometer and strain gages in subsequent tests in which transfer functions relating wing vibration to interior noise were to be determined. These surveys are as follows:(1) wing/fuselage modal survey utilizing one shaker under the right wing; (2) complete wing modal survey utilizing two shakers, one under each wing; and (3) fuselage side panel modal survey utilizing a small instrumented hammer. The predominant frequencies and damping ratios for each analysis were listed in tables. The primary mode shapes at the lower frequencies and at frequencies near the expected engine driving frequencies have been shown for each survey.

**DIRECTIVITY AND TRENDS OF NOISE GENERATED BY A PROPELLER IN A WAKE**
P. J. W. BLOCK and C. L. GENTRY, JR. Sep. 1986 63 p
(NASA-TP-2609; L-16131; NAS 1.60:2609) Avail: NTIS HC A04/MF A01 CSCL 20A

An experimental study of the effects on far-field propeller noise of a pylon wake interaction was conducted with a scale model of a single-rotation propeller in a low-speed anechoic wind tunnel. A detailed mapping of the noise directivity was obtained at 10 test conditions covering a wide range of propeller power landings at several subsonic tip speeds. Two types of noise penalties were investigated-pulser and spacing. The pusher noise penalty is the difference in the average overall sound pressure level, OASPL, for pusher and tractor installations. (In a pusher installation, the propeller disk is downstream of a pylon or another aerodynamic surface.) The spacing noise penalty is the difference in the average OASPL for different distances between the pylon trailing edge and the propeller. The variations of these noise penalties with axial, or flyover, angle theta and circumferential angle phi are presented, and the trends in these noise penalties with tip Mach number and power loading are given for selected values of theta and phi. The circumferential directivity of the noise from a pusher installation showed that the addition noise due to the interaction of the pylon wake with the propeller had a broad peak over a wide range of circumferential angles approximately perpendicular to the pylon with a sharp minimum 90 deg. to the pylon for the majority of cases tested. The variation of the pusher noise penalty with theta had a minimum occurring near the propeller plane and maximum values of as much as 20 dB occurring toward the propeller axes. The magnitude of the pusher noise penalty generally decreased as propeller tip Mach number or power loading was increased. Author

Data were obtained in the full scale flight environment of the Kuiper Airborne Observatory (KAO) on the nature of turbulent shear layer over the open cavity. These data were used to verify proposed aerodynamic scaling relationships to describe the behavior of the turbulent layers and to estimate the optical performance of systems of various wavelengths operating within the KAO environment. These data and wind tunnel data are used to scale the expected optical effects for a potential stratospheric observatory for infrared astronomy (SOFIA) in which a telescope approximately 3.5 times larger than that on the KAO is envisioned. It appears that the use of combinations of active and passive aeromechanical flow control techniques can improve the optical behavior of systems in the SOFIA environment. Experiments to verify these potential improvements can be performed on the KAO with sufficient modifications to the cavity and aero-mechanical technique installations. Author

**DOD OVERHAULS MAINTENANCE**
R. E. BERG (DOD Offices of the Assistant Secretary of Defense, Washington, DC) Aerospace America (ISSN 0740-722X), vol. 24, July 1986, p. 20-22.

Actions taken by the Department of Defense in a new maintenance approach promise substantial gains in aircraft availability and big cost savings. First, DOD has adopted two industry-inspired approaches to maintenance management: reliability-centered maintenance and serial number tracking. Decisions are made whether to repair just what requires repair or to replace prior to failure. Second, DOD has stepped up depot maintenance interservicing - one service using its own or contracted facilities to maintain another service's equipment. Third, DOD has established a program to improve test equipment; managers are being asked to review the 80,000 different models of test equipment owned by the department and reduce the list to fewer, standardized items and where possible use commercial off-the-shelf gear. Important aspects of the program will include increased use of robotics, better nondestructive inspection techniques, and lasers. Better trained personnel and equipment designed from the beginning to be easily maintained will also be significant. D.H.

**ACCUMULATIONS**
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725

**ACOUSTIC FATIGUE**
Predicted and measured strain response of rectangular panels due to acoustic loading
[AIAA PAPER 86-1931] p 751 A86-45421
Response of symmetric rectangular composite laminates with nonlinear damping subjected to acoustic loading
[AIAA PAPER 86-1933] p 738 A86-45422

**ACOUSTIC MEASUREMENT**
Structureborne noise in aircraft: Modal tests
[NASA-TM-87739] p 757 N86-31339
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] p 757 N86-31341

**ACOUSTIC PROPERTIES**
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] p 757 N86-31337

**ACOUSTO-OPTICS**
Sensitivity, noise and optical crosstalk in heterodyne acousto-optical signal processors p 740 A86-46701

**ACQUISITION**
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764

**ACTIVE CONTROL**
Active control of propeller induced noise fields inside a flexible cylinder
[AIAA PAPER 86-1957] p 711 A86-45442
Active minimisation of acoustic potential energy in harmonically excited cylindrical enclosed sound fields
[AIAA PAPER 86-1958] p 752 A86-45443
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] p 727 N86-29870
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques p 728 N86-30647
Finite state modelling of aeroelastic systems for active control applications: A general theory
p 749 N86-30648
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model p 728 N86-30649
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 728 N86-30650

**ACTUATORS**
Controllability of redundant flight control system and pressure equalization of redundant servo actuators
p 723 A86-43497

**ADAPTIVE CONTROL**
Application of adaptive control to aircraft systems
p 746 A86-43476
An adaptive flight control system design for CCV with an unknown interactor matrix p 723 A86-43536
Adaptive wall wind tunnels: A selected, annotated bibliography
[NASA-TM-87639] p 731 N86-29871

**ADDITIVES**
Continuous inline blending of antimisting kerosene
p 734 N86-30015
Olefin polymers as jet fuel antimist additives
p 734 N86-30016
Amine-CO2 adducts as aviation fuel gelling agents
p 701 N86-30020
GTA/BASF antimisting fuel research
p 734 N86-30021

**AERIAL EXPLOSIONS**
Calculation of the explosion of a rapidly flying body
p 738 A86-45344

**AERIAL PHOTOGRAPHY**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728

**AERIAL RECONNAISSANCE**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728

**AEROACOUSTICS**
On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803
Modelling of acoustic radiation problems associated with turbomachinery and rotating blades p 749 A86-44805
Noise control characteristics of synchrophasing. I Analytical investigation --- of turboprop aircraft noise
p 708 A86-44853
Calculation of transonic rotor noise using a frequency domain formulation
[AIAA PAPER 86-1901] p 750 A86-45402
High speed rotor noise due to blade loading
[AIAA PAPER 86-1902] p 750 A86-45403
Rotor noise due to atmospheric turbulence ingestion. II Aeroacoustic results
[AIAA PAPER 86-1903] p 750 A86-45404
Application of the Baseline Rotonet system to the prediction of helicopter tone noise
[AIAA PAPER 86-1904] p 750 A86-45405
An experimental investigation of wing tip turbulence with applications to aerosound
[AIAA PAPER 86-1918] p 691 A86-45413
The effect on radiated noise of non-zero propeller rotational plane attitude
[AIAA PAPER 86-1926] p 750 A86-45417
Counter-rotating propeller noise directivity and trends
[AIAA PAPER 86-1927] p 751 A86-45418
Experimental results of the noise radiation of propellers in non-uniform flows
[AIAA PAPER 86-1928] p 751 A86-45419
Propeller-induced structure-borne noise - Laboratory-based test apparatus
[AIAA PAPER 86-1938] p 730 A86-45425
The near and far acoustic fields of broadband shock associated noise
[AIAA PAPER 86-1943] p 751 A86-45430
High speed flight effects on shock associated noise
[AIAA PAPER 86-1944] p 751 A86-45431
Aeroacoustics of contoured plug-nozzle supersonic jet flows
[AIAA PAPER 86-1946] p 752 A86-45433
Tone-like noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1947] p 752 A86-45434
Broad band noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1948] p 752 A86-45435
Active minimisation of acoustic potential energy in harmonically excited cylindrical enclosed sound fields
[AIAA PAPER 86-1958] p 752 A86-45443
Broadband noise - Its prediction and likely importance for advanced propfans
[AIAA PAPER 86-1963] p 753 A86-45447
Broadband propeller noise prediction in the plane of the rotor
[AIAA PAPER 86-1964] p 753 A86-45448
Concepts for reduction of blade-vortex interaction noise
[AIAA PAPER 86-1855] p 753 A86-45477
Rotor noise due to atmospheric turbulence ingestion. I - Fluid mechanics
[AIAA PAPER 86-1857] p 754 A86-45479
Prediction of structure-borne noise, based on the finite element method
[AIAA PAPER 86-1861] p 754 A86-45481
Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484
Features of discrete tones generated by jet flows over Coanda surfaces
[AIAA PAPER 86-1865] p 691 A86-45485
On the screech tones of supersonic rectangular jets
[AIAA PAPER 86-1866] p 754 A86-45486
Acoustic properties associated with rectangular geometry supersonic nozzles
[AIAA PAPER 86-1867] p 754 A86-45487
The noise emitted by turbulent jets in close proximity to solid surfaces
[AIAA PAPER 86-1869] p 755 A86-45489
Rotor-strut interaction noise of a model fan
[AIAA PAPER 86-1871] p 755 A86-45491
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 8 1872] p 755 A86-45492
Aerodynamics via acoustics - Application of acoustic formulas for aerodynamic calculations
[AIAA PAPER 86-1877] p 691 A86-45494
Development of an impulsive noise source to study the acoustic reflection characteristics of hard-walled wind tunnels
[AIAA PAPER 86-1887] p 755 A86-45500
Acoustic reflection contamination measurements in the 16-foot NASA Langley Transonic Wind Tunnel
[AIAA PAPER 86-1888] p 755 A86-45501
A study of the rotor/rotor interaction tones from a contra-rotating propeller driven aircraft
[AIAA PAPER 86-1894] p 756 A86-45505
Effect of a wind tunnel on the acoustic field from various aeroacoustic sources
[AIAA PAPER 86-1897] p 756 A86-45507
Statistical analysis of the influence of service parameters on the aeroacoustic effects p 712 A86-45750
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] p 757 N86-31337

**AEROASSIST**
Geometerial description for a proposed aeroassist flight experiment vehicle
[NASA-TM-87714] p 749 N86-31237
**AERODYNAMIC CHARACTERISTICS**
Control of the discrete vortices from a delta wing
[AIAA PAPER 86-1915] p 690 A86-45411
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] p 726 N86-29866
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 687 N86-30697
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] p 698 N86-30700
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] p 729 N86-30738
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] p 745 N86-31010
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] p 758 N86-31357
**AERODYNAMIC CONFIGURATIONS**
More accurate simulations of whole aircraft
p 691 A86-45702
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation
[NASA-TM-88248] p 692 N86-29765
NASA and general aviation
[NASA-SP-485] p 716 N86-30720
**AERODYNAMIC DRAG**
Application of unsteady aerodynamics to large-eddy breakup devices in a turbulent flow p 686 A86-44238
Transient induced drag p 689 A86-44879
**AERODYNAMIC FORCES**
The role of structural and aerodynamic damping on the aeroelastic behavior of wings p 708 A86-44894
**AERODYNAMIC HEAT TRANSFER**
Measurements of fluctuations of surface heat transfer rate in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43512
**AERODYNAMIC INTERFERENCE**
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-178954] p 694 N86-29773
Adaptive wall wind tunnels: A selected, annotated bibliography
[NASA-TM-87639] p 731 N86-29871
**AERODYNAMIC LOADS**
Application of harmonic analysis method to research on rotor airloads p 706 A86-43490
High speed rotor noise due to blade loading
[AIAA PAPER 86-1902] p 750 A86-45403
Wing loads induced by a propeller wake
[AIAA PAPER 86-1967] p 711 A86-45450
Aerodynamics via acoustics - Application of acoustic formulas for aerodynamic calculations
[AIAA PAPER 86-1877] p 691 A86-45494
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip
[NASA-CR-177110] p 693 N86-29766
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] p 693 N86-29769
Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 696 N86-30639
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 696 N86-30640
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] p 729 N86-30738
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741
**AERODYNAMIC NOISE**
On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803
Calculation of transonic rotor noise using a frequency domain formulation
[AIAA PAPER 86-1901] p 750 A86-45402
High speed rotor noise due to blade loading
[AIAA PAPER 86-1902] p 750 A86-45403
Pusher propeller noise directivity and trends
[AIAA PAPER 86-1929] p 751 A86-45420
The near and far acoustic fields of broadband shock associated noise
[AIAA PAPER 86-1943] p 751 A86-45430
High speed flight effects on shock associated noise
[AIAA PAPER 86-1944] p 751 A86-45431
Shock noise from supersonic jets in simulated flight to Mach 0.4
[AIAA PAPER 86-1945] p 752 A86-45432
Broad band noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1948] p 752 A86-45435
Active control of propeller induced noise fields inside a flexible cylinder
[AIAA PAPER 86-1957] p 711 A86-45442
Broadband propeller noise prediction in the plane of the rotor
[AIAA PAPER 86-1964] p 753 A86-45448
Rotor noise due to atmospheric turbulence ingestion. I - Fluid mechanics
[AIAA PAPER 86-1857] p 754 A86-45479
Acoustic properties associated with rectangular geometry supersonic nozzles
[AIAA PAPER 86-1867] p 754 A86-45487
The noise emitted by turbulent jets in close proximity to solid surfaces
[AIAA PAPER 86-1869] p 755 A86-45489
Influence of airfoil camber on convected gust interaction noise
[AIAA PAPER 86-1873] p 755 A86-45493
Theoretical prediction of single rotation propeller noise
[AIAA PAPER 86-1891] p 756 A86-45503
Propeller noise caused by blade tip radial forces
[AIAA PAPER 86-1892] p 721 A86-45504
A study of the rotor/rotor interaction tones from a contra-rotating propeller driven aircraft
[AIAA PAPER 86-1894] p 756 A86-45505
Effect of a wind tunnel on the acoustic field from various aeroacoustic sources
[AIAA PAPER 86-1897] p 756 A86-45507
Experimental study of flight effect on fan noise. I - A study of inflow control device for simulating in-flight fan noise in static test p 721 A86-46024
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] p 693 N86-29771
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] p 757 N86-31341
**AERODYNAMIC STABILITY**
Unfolding of degenerate Hopf bifurcation for supersonic flow past a pitching wedge p 725 A86-46456
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] p 726 N86-29865
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
**AERODYNAMIC STALLING**
Dynamic stall - The case of the vertical axis wind turbine p 746 A86-44150
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] p 726 N86-29865
**AERODYNAMICS**
Fundamentals of aviation technology and airport equipment --- Russian book p 685 A86-44291
Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144
Requirements and recommendations for the development of theoretical codes and experimental facilities in the near future --- for aircraft design
[ONERA, TP NO. 1986-10] p 731 A86-46155
Aerodynamic technologies for general aviation aircraft
p 713 A86-46198
Cryogenic wind tunnels for high Reynolds number testing
[NASA-TM-87743] p 731 N86-29872
Development of a numerical procedure to map a general 3-d body onto a near-circle p 749 N86-31420
**AEROELASTICITY**
Transonic aeroelastic analysis of the B-1 wing
[AIAA PAPER 85-0690] p 708 A86-44886
The role of structural and aerodynamic damping on the aeroelastic behavior of wings p 708 A86-44894
The methods implemented at ONERA to improve airplane ground vibration tests
[ONERA, TP NO. 1986-8] p 713 A86-46153
New modal identification methods applied to aeronautical structures
[ONERA, TP NO. 1986-35] p 713 A86-46177
10 years of rotor flows studies at ONERA - State of the art and future studies
[ONERA, TP NO. 1986-49] p 692 A86-46185
Identification of aeroelastic phenomenon employing bispectral analysis techniques p 740 A86-47124
The Second International Symposium on Aeroelasticity and Structural Dynamics
[DGLR-85-02] p 687 N86-30627
Transonic equivalent strip method for aeroelastic applications p 695 N86-30628
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity
p 696 N86-30638
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 696 N86-30640
Static aeroelastic analysis using aircraft vibration modes p 743 N86-30641
A review of aeroelastic research at the Flight Dynamics Laboratory p 727 N86-30642
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 728 N86-30643
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods
p 743 N86-30646
Finite state modelling of aeroelastic systems for active control applications: A general theory
p 749 N86-30648
Tailoring methodology for aeroelastic stability and lateral control enhancement p 729 N86-30657
Anisotropic wing aeroelastic theories with warping effects p 696 N86-30659
Recent results on the weight minimization of panels with a flutter speed constraint p 715 N86-30660
Effects of anisotropic design on the static aeroelasticity of a swept wing --- aeroelastic tailoring
p 687 N86-30661
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane
p 715 N86-30662
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] p 745 N86-31070
**AERONAUTICAL ENGINEERING**
Cryogenic wind tunnels for high Reynolds number testing
[NASA-TM-87743] p 731 N86-29872
**AERONAUTICAL SATELLITES**
Applications of satellite communications technologies to International Civil Aviation p 702 A86-43708
**AEROSPACE ENGINEERING**
Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings
p 709 A86-44936
**AEROSPACE ENVIRONMENTS**
Arnold Engineering Development Center - Simulators encompass spectrum of aerospace environments
p 730 A86-45673
**AEROSPACE INDUSTRY**
World aerospace profile 1986 --- Book
p 686 A86-44919
**AEROSPACE SYSTEMS**
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454
**AEROSPACEPLANES**
Launching the aerospace plane p 686 A86 44442
**AFTERBODIES**
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] p 697 N86-30695
**AFTERBURNING**
Development of in-flight thrust measurement procedures for an afterburning turbofan engine
[AIAA PAPER 85-1405] p 720 A86-45375
**AH-64 HELICOPTER**
Northrop's surrogate trainer --- simulating AH-64A helicopter p 709 A86-44341
**AILERONS**
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] p 727 N86-29868
Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 696 N86-30639
**AIR BREATHING ENGINES**
Experiments on high speed ejectors
[NASA-CR-177419] p 721 N86-29820
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454
**AIR CARGO**
Sniffing out trouble p 689 A86-45757
**AIR COOLING**
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins
p 741 N86-29827

A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29850
Aerodynamic effect of coolent ejection in the rear part of transonic rotor blades p 742 N86-29861
**AIR DEFENSE**
A survey of multiple targets tracking technique
p 735 A86-43489
The SKYEYE RPV - An NDI solution to today's unmanned aerial vehicle requirements
p 712 A86-46134
**AIR NAVIGATION**
VLF radio navigation systems --- Russian book
p 703 A86-44279
Simulation of the algorithms of a navigation computer
p 748 A86-46369
Gravity-induced errors in airborne inertial navigation
p 703 A86-46457
Airborne navigation remote map reader evaluation
[AD-A166976] p 719 N86-30729
**AIR TRAFFIC**
Introduction to the recent developments of China's civil aviation
[AD-A166194] p 687 N86-29763
**AIR TRAFFIC CONTROL**
A survey of multiple targets tracking technique
p 735 A86-43489
A graphic terminal for air traffic control of Canadian military airports p 703 A86-44399
The protected volume of airspace generated by an airborne collision avoidance system p 703 A86-46146
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] p 704 N86-29805
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] p 748 N86-30349
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] p 705 N86-30711
Comprehensive test and evaluation of the Dalmo Victor TCAS 2 industry prototypes
[FAA/PM-862] p 705 N86-30712
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166699] p 705 N86-30714
NASA and general aviation
[NASA-SP-485] p 716 N86-30720
**AIR TRAFFIC CONTROLLERS (PERSONNEL)**
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] p 702 N86-30707
**AIR TRANSPORTATION**
Sniffing out trouble p 690 A86-45757
**AIRBORNE EQUIPMENT**
Smart Built-In-Test (BIT) p 747 A86-43869
Gravity-induced errors in airborne inertial navigation
p 703 A86-46457
An upward looking airborne millimeter wave radiometer for atmospheric water vapor sounding and rain detection
p 718 A86-46676
**AIRBORNE SURVEILLANCE RADAR**
Comprehensive test and evaluation of the Dalmo Victor TCAS 2 industry prototypes
[FAA/PM-862] p 705 N86-30712
**AIRCRAFT ACCIDENT INVESTIGATION**
Aircraft accident report: Provincetown, Boston Airlines Flight 1039, Embraer Bandeirante, EMB-110P1, N96PB, Jacksonville, Florida, December 6, 1984
[PB86-910405] p 701 N86-30703
**AIRCRAFT ACCIDENTS**
Safety recommendation
[NTSB-A-86-22] p 698 N86-29790
National Transportation Safety Board safety recommendation
[NTSB-4357/1] p 699 N86-29792
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] p 700 N86-29796
Post Controlled Impact Demonstration (CID) analysis
p 733 N86-30010
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] p 718 N86-30721
**AIRCRAFT ANTENNAS**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] p 744 N86-30931
**AIRCRAFT CARRIERS**
Control of V/STOL aircraft p 724 A86-46002
**AIRCRAFT COMMUNICATION**
A computer model to evaluate airborne receiver performance in interference environments
p 708 A86-43862
**AIRCRAFT COMPARTMENTS**
Cabin noise characteristics of a small propeller powered aircraft
[AIAA PAPER 86-1906] p 710 A86-45407
Effects of an internal floor on low frequency sound transmission into aircraft cabins - An experimental investigation
[AIAA PAPER 86-1939] p 711 A86-45426
Structural influence of cabin floor on sound transmission into propeller aircraft - Analytical investigations
[AIAA PAPER 86-1940] p 711 A86-45427
A comparison of the structureborne and airborne paths for propfan interior noise
[AIAA PAPER 86-1963] p 711 A86-45483
Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] p 743 N86-30890
**AIRCRAFT CONFIGURATIONS**
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] p 687 N86-30695
PAN AIR application to the F-106B
[NASA-CR-178165] p 688 N86-30698
**AIRCRAFT CONSTRUCTION MATERIALS**
The certification of airframes and components in metals and composites p 737 A86-43798
CFRP-wing for the Alpha jet p 686 A86-46199
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838
**AIRCRAFT CONTROL**
Application of adaptive control to aircraft systems
p 746 A86-43476
An optimal parameter estimation method compatible with stable parameter prediction in time domain
p 746 A86-43482
Design and research of aircraft parameter-adaptive lateral command augmentation systems
p 723 A86-43498
Flight testing of the navigation and flight control complexes of aircraft and helicopters --- Russian book
p 708 A86-44283
Optimal take-off trajectories in the presence of windshear p 709 A86-44386
New technologies offer quantum leap in future fighter capabilities p 686 A86-45063
Boeing developing new cockpit displays to ease pilot workload p 717 A86-45066
Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144
The singular-G method for unstable non-minimum-phase plants p 747 A86-45736
Control of V/STOL aircraft p 724 A86-46002
An analysis of the motion of an aircraft on the ground
p 725 A86-46367
Disturbance attenuation by a frequency-shaped linear-quadratic-regulator method --- applied to design of feedback control system for aircraft gust alleviation
p 725 A86-46453
Decision aiding for tactical aircraft
p 718 A86-46715
Piloting of unmanned air vehicles p 726 A86-46716
Aircraft hydraulic systems: An introduction to the analysis of systems and components --- Book
p 713 A86-46850
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] p 726 N86-29867
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 728 N86-30650
Tailoring methodology for aeroelastic stability and lateral control enhancement p 729 N86-30657
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176899] p 729 N86-30736
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] p 729 N86-30738
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 749 N86-31265
**AIRCRAFT DESIGN**
An adaptive flight control system design for CCV with an unknown interactor matrix p 723 A86-43536
Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 p 706 A86-43776
Fatigue and damage tolerance work during the aircraft design process p 706 A86-43777
Damage tolerance - USAF experience
p 736 A86-43784
Damage tolerance and durability in the design of a short-haul turboprop aircraft p 707 A86-43790
Residual strength characterization of jet transport structures p 707 A86-43795
The optimization of seaplanes - New chances and requirements regarding flying boats p 707 A86-43930
X-wing rotor systems test vehicle scheduled for flight in October p 707 A86-44001
Rafale will keep tricolor flying --- experimental combat aircraft p 707 A86-44003
New technologies for a European fighter
p 708 A86-44004
Doubling the Air Force through greater reliability
p 685 A86-44006
Fundamentals of aviation technology and airport equipment --- Russian book p 685 A86-44291
Launching the aerospace plane p 686 A86-44442
Rapid sizing method for airplanes p 706 A86-44887
World aerospace profile 1986 --- Book
p 686 A86-44919
New technologies offer quantum leap in future fighter capabilities p 686 A86-45063
British experimental aircraft program providing insight into new technology p 710 A86-45064
NASA's Langley Center making gains in advanced technology projects p 686 A86-45065
Boeing developing new cockpit displays to ease pilot workload p 717 A86-45066
Crew situational awareness drives avionics developments p 718 A86-45067
More accurate simulations of whole aircraft
p 691 A86-45702
LHX targets dollars as well as bogeys
p 686 A86-45704
Corporate flying, Italian style p 712 A86-45753
More than a Mirage p 712 A86-45758
A come-back in canards p 712 A86-46125
Requirements and recommendations for the development of theoretical codes and experimental facilities in the near future --- for aircraft design
[ONERA, TP NO. 1986-10] p 731 A86-46155
Aerodynamic technologies for general aviation aircraft
p 713 A86-46198
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] p 693 N86-29770
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] p 714 N86-29811
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] p 726 N86-29867
Current design procedures for minimizing post crash fire hazards p 700 N86-30019
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 728 N86-30651
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing
p 715 N86-30654
Tailoring methodology for aeroelastic stability and lateral control enhancement p 729 N86-30657
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane
p 715 N86-30662
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] p 716 N86-30719
NASA and general aviation
[NASA-SP-485] p 716 N86-30720
**AIRCRAFT DETECTION**
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] p 744 N86-30931
**AIRCRAFT ENGINES**
Mode II fatigue crack growth specimen development
p 736 A86-43566
Influence of turbine-engine design on flight safety
p 720 A86-43939
The next hot fighter engine p 720 A86-44005
Rotary grows up p 720 A86-44007
Axisymmetric three-dimensional flow in the cooled gas turbine --- German thesis p 720 A86-44925
Arnold Engineering Development Center - New facility to assess engine-airframe compatibility prior to first flight
p 730 A86-45674
National Transportation Safety Board safety recommendation
[NTSB-4360/33] p 699 N86-29791
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] p 721 N86-29819

Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856
Dynamic analysis of structures with flexible rotors --- aircraft engines p 722 N86-30664
NASA and general aviation [NASA-SP-485] p 716 N86-30720
Robust detection, isolation and accommodation for sensor failures [NASA-CR-174825] p 722 N86-30732
Advances in the study of the mechanical behavior of materials [AD-A164656] p 735 N86-30838

**AIRCRAFT EQUIPMENT**
Methods of the assembly of aircraft instrumentation and systems --- Russian book p 685 A86-44284
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs [RTCA/DO-190] p 705 N86-30711
Airborne navigation remote map reader evaluation [AD-A166976] p 719 N86-30729

**AIRCRAFT FUEL SYSTEMS**
Safety recommendation [NTSB-A-86-22] p 699 N86-29790

**AIRCRAFT FUELS**
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage [DOT/FAA/CT-85/35] p 700 N86-29795
Liquid hydrogen fueled passenger aircraft [AD-A166229] p 717 N86-30724
High accuracy fuel flowmeter [NASA-CR-174869] p 745 N86-31030

**AIRCRAFT HAZARDS**
The fire-hard airliner p 698 A86-44400
F-14A inlet icing p 709 A86-44937
Development of airborne electric field and lightning detection instrumentation for aviation safety [AD-A167342] p 701 N86-30705
Electrostatic hazards of urethane packed fuel tanks [AD-A166803] p 717 N86-30725
Fire extinguishing agents for oxygen-enriched atmospheres [AD-A166967] p 743 N86-30890

**AIRCRAFT HYDRAULIC SYSTEMS**
Aircraft hydraulic systems: An introduction to the analysis of systems and components --- Book p 713 A86-46850

**AIRCRAFT INDUSTRY**
An example of integrated logistic support applied also to production testing --- aircraft industry p 744 N86-30898

**AIRCRAFT INSTRUMENTS**
Built In Test (BIT) utilization for improved supportability of the F-20 aircraft p 685 A86-43906
Methods of the assembly of aircraft instrumentation and systems --- Russian book p 685 A86-44284
An intelligent amplifier and its application to modal testing --- for inflight aircraft testing p 719 A86-47106

**AIRCRAFT LANDING**
Ground resonance of a helicopter during the take-off and landing run p 712 A86-45749
DME/P - A necessary MLS component for the future p 703 A86-46140
ILS goal - Automatic landings, safety p 703 A86-46142
The integrated manual and atuomatic control of complex flight systems [NASA-CR-176940] p 729 N86-30737

**AIRCRAFT MAINTENANCE**
Maintenance system by means of damage tolerance principle p 736 A86-43791
Built In Test (BIT) utilization for improved supportability of the F-20 aircraft p 685 A86-43906
Doubling the Air Force through greater reliability p 685 A86-44006
Generic integrated maintenance diagnostics p 685 A86-44422
DOD overhauls maintenance p 758 A86-45703

**AIRCRAFT MANEUVERS**
The effect of rain and contamination of the front surface on the in-flight behavior of aircraft during roll. II p 688 A86-43938
Navy departure/spin and air combat maneuvering evaluation of a National Aeronautics and Space Administration developed flight control system for the F-14 p 724 A86-44944
Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144
The dynamics of limiting helicopter maneuvers at a very low altitude p 724 A86-45748
Development of control laws for a flight test maneuver autopilot p 725 A86-46460
The performance evaluation of a jet flap on an advanced supersonic harrier [NASA-CR-179653] p 716 N86-30722
A survey of handling qualities criteria and their applications to high performance aircraft [NASA-CR-179654] p 729 N86-30738

**AIRCRAFT MODELS**
Rapid sizing method for airplanes p 708 A86-44887
Vibration analysis of a helicopter fuselage by means of mathematical models p 725 A86-46368
Rapid vibration mode analysis of aircraft with external stores p 716 N86-30679

**AIRCRAFT NOISE**
Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505
Application of the Baseline Rotonet system to the prediction of helicopter tone noise [AIAA PAPER 86-1904] p 750 A86-45405
Structureborne noise investigations of a twin engine aircraft [AIAA PAPER 86-1905] p 710 A86-45406
The effect on radiated noise of non-zero propeller rotational plane attitude [AIAA PAPER 86-1926] p 750 A86-45417
Experimental results of the noise radiation of propellers in non-uniform flows [AIAA PAPER 86-1928] p 751 A86-45419
Propeller-induced structure-borne noise - Laboratory-based test apparatus [AIAA PAPER 86-1936] p 730 A86-45425
Effects of an internal floor on low frequency sound transmission into aircraft cabins - An experimental investigation [AIAA PAPER 86-1939] p 711 A86-45426
Structural influence of cabin floor on sound transmission into propeller aircraft - Analytical investigations [AIAA PAPER 86-1940] p 711 A86-45427
Tone-like noise from an isolated two dimensional airfoil [AIAA PAPER 86-1947] p 752 A86-45434
Active control of propeller induced noise fields inside a flexible cylinder [AIAA PAPER 86-1957] p 711 A86-45442
Active minimisation of acoustic potential energy in harmonically excited cylindrical enclosed sound fields [AIAA PAPER 86-1958] p 752 A86-45443
Advanced turboprop aircraft noise annoyance - A review of recent NASA research [AIAA PAPER 86-1959] p 752 A86-45444
Aircraft noise measurement - Alternatives to the standard 1-2 metres microphone height [AIAA PAPER 86-1960] p 752 A86-45445
Broadband noise - Its prediction and likely importance for advanced propfans [AIAA PAPER 86-1963] p 753 A86-45447
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding [AIAA PAPER 86-1966] p 711 A86-45449
Wing loads induced by a propeller wake [AIAA PAPER 86-1967] p 711 A86-45450
Prediction of structure-borne noise, based on the finite element method [AIAA PAPER 86-1861] p 754 A86-45481
A comparison of the structureborne and airborne paths for propfan interior noise [AIAA PAPER 86-1863] p 711 A86-45483
Theoretical prediction of single rotation propeller noise [AIAA PAPER 86-1891] p 756 A86-45503
A study of the rotor/rotor interaction tones from a contra-rotating propeller driven aircraft [AIAA PAPER 86-1894] p 756 A86-45505
Statistical analysis of the influence of service parameters on the aeroacoustic effects p 712 A86-45750
A new version of the helicopter aural detection program, ICHIN [NASA-TM-87745] p 756 N86-30471
A study of methods to predict and measure the transmission of sound through the walls of light aircraft [NASA-CR-177147] p 757 N86-31335
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study [NASA-TP-2563] p 757 N86-31337
Structureborne noise in aircraft: Model tests [NASA-TM-87739] p 757 N86-31339

**AIRCRAFT PARTS**
Precision casting of aero gas turbine components p 739 A86-45816

**AIRCRAFT PERFORMANCE**
Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings p 709 A86-44936
Boeing 737-300 flight test and the first nine months service experience p 709 A86-44940
X-29 initial flight test results p 709 A86-44942
AV-8B high angle of attack/spin program p 710 A86-44943
New technologies offer quantum leap in future fighter capabilities p 686 A86-45063
British experimental aircraft program providing insight into new technology p 710 A86-45064
More accurate simulations of whole aircraft p 691 A86-45702
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees [NASA-CR-176962] p 726 N86-29865
The performance evaluation of a jet flap on an advanced supersonic harrier [NASA-CR-179653] p 716 N86-30722

**AIRCRAFT PILOTS**
Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459
Will the USAF need ground-based air traffic control radar in the year 2000? [AD-A166504] p 704 N86-29805

**AIRCRAFT POWER SUPPLIES**
Transmission line design for a power distribution system at 20 kHz for aircraft [NASA-CR-3987] p 721 N86-29818

**AIRCRAFT PRODUCTION**
Methods of the assembly of aircraft instrumentation and systems --- Russian book p 685 A86-44284
Avanti to fly soon p 713 A86-46405

**AIRCRAFT PRODUCTION COSTS**
LHX targets dollars as well as bogeys p 686 A86-45704

**AIRCRAFT RELIABILITY**
Fatigue and damage tolerance work during the aircraft design process p 706 A86-43777
The significance of flight-simulation fatigue tests p 706 A86-43779
Damage tolerance - USAF experience p 736 A86-43784
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
Damage tolerance test program of the Fokker 100 p 706 A86-43786
Airbus Industrie A310 and A300-600 experience with practical applications of damage tolerance design in fuselage primary structure p 707 A86-43787
Continued airworthiness of damage tolerant aircraft p 707 A86-43788
Continuing structural integrity program for transport aircraft p 736 A86-43789
Damage tolerance and durability in the design of a short-haul turboprop aircraft p 707 A86-43790
Maintenance system by means of damage tolerance principle p 736 A86-43791
A rationale for the safe operation of an aircraft fleet having known cracks in primary structure p 737 A86-43792
A simple crack closure model for predicting fatigue crack growth under flight simulation loading p 737 A86-43796
The certification of airframes and components in metals and composites p 737 A86-43798
Doubling the Air Force through greater reliability p 685 A86-44006
DOD overhauls maintenance p 758 A86-45703
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system [AD-A166888] p 698 N86-30700
Aircraft transparency testing: Artificial birds [AD-A166832] p 701 N86-30704

**AIRCRAFT SAFETY**
The fire-hard airliner p 698 A86-44400
The Boeing crew escape technologies (CREST) program p 708 A86-44776
1985 USAF ejection summary p 698 A86-44777
Sniffing out trouble p 699 A86-45757
LLWAS - An integral part of the U.S. wind-shear safety programme p 746 A86-46138
Task Force report on emergency evacuation of transport airplanes, volume 1 [DOT/FAA/VS-86/1.1] p 699 N86-29793
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation [FAA/VS-86/1,2] p 700 N86-29797
Proceedings of Fuel Safety Workshop [DOT/FAA/PM-86/13] p 733 N86-30007
FAA fuel containment R and D p 733 N86-30011
Safety fuels-specifications and progress p 734 N86-30018
Current design procedures for minimizing post crash fire hazards p 700 N86-30019
The physical and empirical basis for a specific clear-air turbulence risk index [NASA-CR-3971] p 746 N86-30285
Development of airborne electric field and lightning detection instrumentation for aviation safety [AD-A167342] p 701 N86-30705

Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] p 702 N86-30707
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] p 735 N86-30883

**AIRCRAFT SPECIFICATIONS**
New technologies offer quantum leap in future fighter capabilities p 686 A86-45063

**AIRCRAFT SPIN**
AV-8B high angle of attack/spin program
p 710 A86-44943
Navy departure/spin and air combat maneuvering evaluation of a National Aeronautics and Space Administration developed flight control system for the F-14 p 724 A86-44944

**AIRCRAFT STABILITY**
Preliminary design of low authority SAS. II --- stability augmentation system p 724 A86-45058
Active suppression of compressor instabilities
[AIAA PAPER 86-1914] p 690 A86-45410
The methods implemented at ONERA to improve airplane ground vibration tests
[ONERA, TP NO. 1986-8] p 713 A86-46153
Vibration analysis of a helicopter fuselage by means of mathematical models p 725 A86-46368
A comparison of methods for aircraft ground vibration testing p 713 A86-47096
Tailoring methodology for aeroelastic stability and lateral control enhancement p 729 N86-30657
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane
p 715 N86-30662

**AIRCRAFT STRUCTURES**
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
Damage tolerance test program of the Fokker 100
p 706 A86-43786
Airbus industrie A310 and A300-600 experience with practical applications of damage tolerance design in fuselage primary structure p 707 A86-43787
A rationale for the safe operation of an aircraft fleet having known cracks in primary structure
p 737 A86-43792
The influence of slow growth and net section yielding on the residual strength of stiffened structure
p 737 A86-43793
Fracture diagrams for stiffened aircraft structures - Effects of material non-linearity p 737 A86-43794
Residual strength characterization of jet transport structures p 707 A86-43795
Aircraft flutter analysis (The Fourth John Weston Memorial Lecture) p 724 A86-44932
Structural modification by modal correction
p 738 A86-44934
An iterative method for statically indeterminate structures of flight vehicle p 738 A86-45059
Structureborne noise investigations of a twin engine aircraft
[AIAA PAPER 86-1905] p 710 A86-45406
Predicted and measured strain response of rectangular panels due to acoustic loading
[AIAA PAPER 86-1931] p 751 A86-45421
Response of symmetric rectangular composite laminates with nonlinear damping subjected to acoustic loading
[AIAA PAPER 86-1933] p 738 A86-45422
Optimization of stiffened panels under compression
p 739 A86-45762
Fiber optic sensors for flexure measurement of aircraft structures p 739 A86-46135
New modal identification methods applied to aeronautical structures
[ONERA, TP NO. 1986-35] p 713 A86-46177
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 696 N86-30640
Static aeroelastic analysis using aircraft vibration modes p 743 N86-30641
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods
p 743 N86-30646
Structural optimization programs and methods --- aircraft weight reduction p 715 N86-30655
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane
p 715 N86-30662
Structural dynamic aspects of rotor nodal isolation --- helicopters p 715 N86-30665
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing p 743 N86-30669
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] p 717 N86-30726
Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures p 743 N86-30781
Structureborne noise in aircraft: Modal tests
[NASA-TM-87739] p 757 N86-31339

**AIRCRAFT SURVIVABILITY**
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] p 735 N86-30883

**AIRCRAFT TIRES**
Simulation of aircraft taxi testing on the AGILE shaker test facility p 731 N86-30663

**AIRCRAFT WAKES**
An approximate model of vortex decay in the atmosphere p 689 A86-44889
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] p 757 N86-31341

**AIRFIELD SURFACE MOVEMENTS**
An analysis of the motion of an aircraft on the ground
p 725 A86-46367

**AIRFOIL PROFILES**
The reverse-flow theorem for transonic flow
p 688 A86-44802
On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803

**AIRFOILS**
Dynamic stall - The case of the vertical axis wind turbine p 746 A86-44150
Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401
Tone-like noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1947] p 752 A86-45434
Unfolding of degenerate Hopf bifurcation for supersonic flow past a pitching wedge p 725 A86-46456
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 695 N86-30631
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CP 176883] p 697 N86-30693
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] p 697 N86-30696
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] p 745 N86-30996

**AIRFRAME MATERIALS**
The certification of airframes and components in metals and composites p 737 A86-43798

**AIRFRAMES**
Variation of anisotropic behavior in structural optimization --- aircraft composite structures
p 715 N86-30656
Crashworthiness of airframes
[AGARD-R-737] p 702 N86-30709
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] p 717 N86-30726

**AIRLINE OPERATIONS**
The selection and acquisition of commercial aircraft fleets p 686 A86-44935

**AIRPORT TOWERS**
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] p 705 N86-30714

**AIRPORTS**
Fundamentals of aviation technology and airport equipment --- Russian book p 685 A86-44291
Introduction to the recent developments of China's civil aviation
[AD-A166194] p 687 N86-29763
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] p 704 N86-29802
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] p 705 N86-30715

**AIRSPACE**
The protected volume of airspace generated by an airborne collision avoidance system p 703 A86-46146

**AIRSPEED**
A system for introducing mutual corrections into the airborne temperature and air-speed meters
p 738 A86-45208

**ALGORITHMS**
Simulation of the algorithms of a navigation computer
p 748 A86-46369
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation
[NASA-TM-88243] p 692 N86-29765
Pseudo-time algorithms for the Navier-Stokes equations
[NASA-CR-178127] p 694 N86-29776
The design of multirate digital control systems
[NASA-CR-177126] p 726 N86-29863
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] p 748 N86-30349
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] p 729 N86-30736

**ALKENES**
Olefin polymers as jet fuel antimist additives
p 734 N86-30016

**ALTIMETERS**
Identification and estimation of the random error models for inertial accelerometer and baro-altimeter
p 717 A86-43481

**ALTIMETRY**
The accuracy of air-temperature and flight-altitude measurements aboard meteorological aircraft
p 718 A86-45209

**ALUMINUM ALLOYS**
The need for rapidly solidified powder metallurgy aluminum alloys for aerospace applications
p 732 A86-46827
Developments in premium high-strength powder metallurgy alloys by Kaiser Aluminum
p 733 A86-46842

**AMINES**
Amine-CO2 adducts as aviation fuel gelling agents
p 701 N86-30020

**AMPLIFICATION**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908

**AMPLIFIER DESIGN**
An intelligent amplifier and its application to modal testing --- for inflight aircraft testing p 719 A86-47106

**ANALOG DATA**
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] p 719 N86-29816

**ANALYZERS**
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821

**ANECHOIC CHAMBERS**
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] p 757 N86-31337

**ANGLE OF ATTACK**
A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds
p 687 A86-43485
AV-8B high angle of attack/spin program
p 710 A86-44943
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] p 695 N86-29786
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] p 726 N86-29865
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] p 742 N86-30090

**ANGLES (GEOMETRY)**
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] p 704 N86-29804

**ANISOTROPIC PLATES**
Anisotropic wing aeroelastic theories with warping effects p 696 N86-30659

**ANISOTROPY**
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 728 N86-30643
Variation of anisotropic behavior in structural optimization --- aircraft composite structures
p 715 N86-30656
Effects of anisotropic design on the static aeroelasticity of a swept wing --- aeroelastic tailoring
p 687 N86-30661

**ANOMALIES**
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801

**ANTENNA RADIATION PATTERNS**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908

Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] p 744 N86-30931

**ANTIMISTING FUELS**
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] p 700 N86-29795
Antimisting fuel technology for transport category aircraft p 733 N86-30008
AMK full-scale transport aircraft validation phase summary p 733 N86-30009
Post Controlled Impact Demonstration (CID) analysis p 733 N86-30010
UK work on safety fuels p 733 N86-30012
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013
Continuous inline blending of antimisting kerosene p 734 N86-30015
Olefin polymers as jet fuel antimist additives p 734 N86-30016
AMK: Still viable? p 734 N86-30017
Amine-CO2 adducts as aviation fuel gelling agents p 701 N86-30020
GTA/BASF antimisting fuel research p 734 N86-30021
Antimisting kerosene: Evaluation of improved FM-9 additive
[DOT/FAA/CT-85-4] p 734 N86-30024
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] p 735 N86-30883

**APPLICATIONS PROGRAMS (COMPUTERS)**
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] p 696 N86-30691
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] p 729 N86-30736

**APPROACH**
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] p 704 N86-29804

**APPROXIMATION**
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] p 694 N86-29777

**ARTIFICIAL INTELLIGENCE**
Smart Built-In-Test (BIT) p 747 A86-43889
Boeing developing new cockpit displays to ease pilot workload p 717 A86-45066
Applications of artificial intelligence II; Proceedings of the Meeting, Arlington, VA, April 9-11, 1985
[SPIE-548] p 748 A86-46706
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718

**ASSEMBLING**
Methods of the assembly of aircraft instrumentation and systems --- Russian book p 685 A86-44284

**ASYMPTOTIC METHODS**
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 749 N86-31265

**ATMOSPHERIC EFFECTS**
An approximate model of vortex decay in the atmosphere p 689 A86-44889

**ATMOSPHERIC MOISTURE**
An upward looking airborne millimeter wave radiometer for atmospheric water vapor sounding and rain detection p 718 A86-46676

**ATMOSPHERIC SOUNDING**
An upward looking airborne millimeter wave radiometer for atmospheric water vapor sounding and rain detection p 718 A86-46676

**ATMOSPHERIC TEMPERATURE**
A system for introducing mutual corrections into the airborne temperature and air-speed meters p 738 A86-45208
The accuracy of air-temperature and flight-altitude measurements aboard meteorological aircraft p 718 A86-45209

**ATMOSPHERIC TURBULENCE**
Rotor noise due to atmospheric turbulence ingestion. II Aeroacoustic results
[AIAA PAPER 86-1903] p 750 A86-45404
Rotor noise due to atmospheric turbulence ingestion. - Fluid mechanics
[AIAA PAPER 86-1857] p 754 A86-45479

**ATTACK AIRCRAFT**
Soviet attack helicopters p 712 A86-46005
A simulation of an integrated flight control/air-ground cannon firing system
[ONERA, TP NO. 1986-31] p 725 A86-46173

**ATTITUDE CONTROL**
On a method for pilot dynamics identification reflecting feedback structures p 747 A86-43511
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] p 700 N86-29798

**ATTITUDE INDICATORS**
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] p 719 N86-29817

**AUDITORY PERCEPTION**
Advanced turboprop aircraft noise annoyance - A review of recent NASA research
[AIAA PAPER 86-1959] p 752 A86-45444
A new version of the helicopter aural detection program, ICHIN
[NASA-TM-87745] p 756 N86-30471

**AUTOMATIC CONTROL**
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838

**AUTOMATIC FLIGHT CONTROL**
Simulation of the algorithms of a navigation computer p 748 A86-46369
Development of control laws for a flight test maneuver autopilot p 725 A86-46460
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] p 748 N86-30349

**AUTOMATIC GAIN CONTROL**
An intelligent amplifier and its application to modal testing --- for inflight aircraft testing p 719 A86-47106

**AUTOMATIC LANDING CONTROL**
ILS goal - Automatic landings, safety p 703 A86-46142

**AUTOMATIC PILOTS**
Development of control laws for a flight test maneuver autopilot p 725 A86-46460

**AUTOMATIC TEST EQUIPMENT**
Smart Built-In-Test (BIT) p 747 A86-43889
Line replaceable modules - The next generation of avionics p 685 A86-43890
Built In Test (BIT) utilization for improved supportability of the F-20 aircraft p 685 A86-43906
An intelligent amplifier and its application to modal testing --- for inflight aircraft testing p 719 A86-47106

**AUTONOMOUS NAVIGATION**
Piloting of unmanned air vehicles p 726 A86-46716

**AUTOREGRESSIVE PROCESSES**
On a method for pilot dynamics identification reflecting feedback structures p 747 A86-43511

**AUTOROTATION**
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] p 700 N86-29796
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] p 714 N86-29809

**AVIONICS**
Line replaceable modules - The next generation of avionics p 685 A86-43890
Built In Test (BIT) utilization for improved supportability of the F-20 aircraft p 685 A86-43906
Crew situational awareness drives avionics developments p 718 A86-45067
Trends in civil avionics for the near future p 718 A86-46141
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] p 700 N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] p 700 N86-29799
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] p 703 N86-29800
Advanced laser based inertial instrument development
[AD-A166307] p 742 N86-30128
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] p 702 N86-30708
NASA and general aviation
[NASA-SP-485] p 716 N86-30720

**AXIAL COMPRESSION LOADS**
Stability analysis of composite stiffened layer plates under compression p 735 A86-43495
Buckling and initial post buckling analysis of composite panels under axial compression p 735 A86-43496

**AXISYMMETRIC BODIES**
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] p 687 N86-30695

**AXISYMMETRIC FLOW**
Axisymmetric three-dimensional flow in the cooled gas turbine --- German thesis p 720 A86-44925

## B

**B-1 AIRCRAFT**
Transonic aeroelastic analysis of the B-1 wing
[AIAA PAPER 85-0690] p 708 A86-44886

**BACKSCATTERING**
Ultrasonic direct backscattering technique for material surface inspection p 740 A86-47133

**BAGGAGE**
Sniffing out trouble p 699 A86-45757

**BAROMETERS**
Identification and estimation of the random error models for inertial accelerometer and baro-altimeter p 717 A86-43481

**BEARINGS**
Mode II fatigue crack growth specimen development p 736 A86-43566
Expert systems for mechanical fault diagnosis p 737 A86-43896
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 738 A86-45256

**BIBLIOGRAPHIES**
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] p 756 N86-30470

**BIRD-AIRCRAFT COLLISIONS**
Propeller FOD qualification using modal analysis, artificial birds, and a static impact facility p 731 A86-47127
Aircraft transparency testing: Artificial birds
[AD-A166832] p 701 N86-30704

**BIRDS**
Aircraft transparency testing: Artificial birds
[AD-A166832] p 701 N86-30704

**BLADE SLAP NOISE**
Noise control characteristics of synchrophasing. I Analytical investigation --- of turboprop aircraft noise p 708 A86-44853
Mid-field and far-field calculations of Blade-Vortex Interactions
[AIAA PAPER 86-1854] p 753 A86-45476

**BLADE TIPS**
Propeller noise caused by blade tip radial forces
[AIAA PAPER 86-1892] p 721 A86-45504
10 years of rotor flows studies at ONERA - State of the art and future studies
[ONERA, TP NO. 1986-49] p 692 A86-46185
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip
[NASA-CR-177110] p 693 N86-29766
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] p 745 N86-31070

**BLUNT BODIES**
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] p 693 N86-29772

**BLUNT LEADING EDGES**
Hypersonic viscous shock layer on a surface with an abrupt variation of catalytic activity p 737 A86-43994

**BODIES OF REVOLUTION**
Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method
[ONERA, TP NO. 1986-29] p 692 A86-46171

**BODY KINEMATICS**
Calculation of the explosion of a rapidly flying body p 738 A86-45344

**BODY-WING CONFIGURATIONS**
Some problems in the finite-difference computation of three-dimensional transonic flows p 687 A86-43501

**BOEING 720 AIRCRAFT**
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] p 716 N86-30721

**BOEING 737 AIRCRAFT**
Boeing 737-300 flight test and the first nine months service experience p 709 A86-44940

**BOUNDARY ELEMENT METHOD**
Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484

**BOUNDARY LAYER CONTROL**
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-88011] p 715 N86-29815

**BOUNDARY LAYER SEPARATION**
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] p 745 N86-31010

**BOUNDARY LAYER STABILITY**
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] p 694 N86-29778

**BOUNDARY LAYER TRANSITION**
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] p 693 N86-29771
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] p 694 N86-29778
Wake-passing in a turbine rotor cascade
p 741 N86-29830

**BOUNDARY LAYERS**
A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] p 697 N86-30696

**BOUNDARY VALUE PROBLEMS**
Far-field boundary conditions for transonic lifting solutions to the Euler equations p 689 A86-44855
The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem p 690 A86-45189
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] p 696 N86-30691
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] p 757 N86-31335

**BRANCHING (MATHEMATICS)**
Unfolding of degenerate Hopf bifurcation for supersonic flow past a pitching wedge p 725 A86-46456

**BROADBAND**
Broad band noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1948] p 752 A86-45435
Broadband noise - Its prediction and likely importance for advanced propfans
[AIAA PAPER 86-1963] p 753 A86-45447

**BUCKLING**
Buckling and initial post buckling analysis of composite panels under axial compression p 735 A86-43496
Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures p 743 N86-30781

**BUFFETING**
An investigation of empennage buffeting
[NASA-CR-176973] p 726 N86-29864

**BUTENES**
GTA/BASF antimisting fuel research
p 734 N86-30021

## C

**C-130 AIRCRAFT**
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] p 704 N86-29806

**C-141 AIRCRAFT**
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] p 742 N86-30090
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] p 758 N86-31357

**CALIBRATING**
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233
High accuracy fuel flowmeter
[NASA-CR-174869] p 745 N86-31030

**CAMBERED WINGS**
Influence of airfoil camber on convected gust interaction noise
[AIAA PAPER 86-1873] p 755 A86-45493

**CANARD CONFIGURATIONS**
A come-back in canards p 712 A86-46125

**CANONICAL FORMS**
A canonical form for nonlinear systems
[NASA-CR-176974] p 748 N86-30371

**CAPILLARY FLOW**
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821

**CAPTIVE TESTS**
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] p 698 N86-30700

**CARBON**
Carbon residue studies with a microcarbon residue tester
[ASLE PREPRINT 86-AM-7A-1] p 732 A86-45395

**CARBON FIBER REINFORCED PLASTICS**
CFRP-wing for the Alpha jet p 686 A86-46199
Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures p 743 N86-30781

**CASCADE FLOW**
Role of shocks in transonic/supersonic compressor rotor flutter p 720 A86-44872
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492
Theoretical flutter investigations on a plane cascade in incompressible flow --- axial flow compressors and turbines p 727 N86-30635
Application of unsteady wing collocation methods to cascades in subsonic flow p 696 N86-30636

**CAST ALLOYS**
Mechanical design of gas turbine blading in cast superalloys p 721 A86-45819
Superalloy component durability enhancements
p 739 A86-46562

**CASTING**
Precision casting of aero gas turbine components
p 739 A86-45816

**CATALYTIC ACTIVITY**
Hypersonic viscous shock layer on a surface with an abrupt variation of catalytic activity p 737 A86-43994

**CAVITATION FLOW**
UK work on safety fuels p 733 N86-30012
Feasibility study for convertible engine torque converter
[NASA-CR-175082] p 722 N86-30733

**CAVITIES**
Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484

**CERAMICS**
Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858

**CERTIFICATION**
Certification flight testing of civilian helicopters in the United Kingdom p 710 A86-44947

**CESSNA AIRCRAFT**
Safety recommendation
[NTSB-A-86-22] p 699 N86-29790

**CHEMICAL TESTS**
Carbon residue studies with a microcarbon residue tester
[ASLE PREPRINT 86-AM-7A-1] p 732 A86-45395

**CHEMILUMINESCENCE**
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821

**CHUTES**
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] p 700 N86-29797

**CIRCLES (GEOMETRY)**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908

**CIRCULAR CYLINDERS**
Flows past a rotating circular cylinder at high Reynolds number p 688 A86-43533
Scheme for calculating an almost-asymmetric gas flow and supersonic flow past the end of a cylinder at a small angle of attack p 690 A86-45345

**CIRCULATION CONTROL AIRFOILS**
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
Navier-Stokes computations for circulation controlled airfoils
[AIAA-85-1587] p 744 N86-30995

**CIRCULATION CONTROL ROTORS**
Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477

**CIVIL AVIATION**
Applications of satellite communications technologies to International Civil Aviation p 702 A86-43708
Fundamentals of aviation technology and airport equipment --- Russian book p 685 A86-44291
Forecasting for civil aviation. II p 746 A86-44380
The selection and acquisition of commercial aircraft fleets p 686 A86-44935
Trends in civil avionics for the near future
p 718 A86-46141
Introduction to the recent developments of China's civil aviation
[AD-A166194] p 687 N86-29763
NASA and general aviation
[NASA-SP-485] p 716 N86-30720
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] p 729 N86-30736

**CL-600 CHALLENGER AIRCRAFT**
Continued airworthiness of damage tolerant aircraft
p 707 A86-43788

**CLEAR AIR TURBULENCE**
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] p 746 N86-30285

**CLEARANCES**
Store separation flight testing
[AGARD-AG-300-VOL-5] p 717 N86-30727

**CLOCKS**
Advanced laser based inertial instrument development
[AD-A166307] p 742 N86-30128

**COANDA EFFECT**
Features of discrete tones generated by jet flows over Coanda surfaces
[AIAA PAPER 86-1865] p 691 A86-45485

**COASTS**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728

**COCKPITS**
Boeing developing new cockpit displays to ease pilot workload p 717 A86-45066
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] p 703 N86-29800
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] p 748 N86-30349

**CODING**
PAN AIR application to the F-106B
[NASA-CR-178165] p 698 N86-30698

**COLLISION AVOIDANCE**
The protected volume of airspace generated by an airborne collision avoidance system p 703 A86-46146
Comprehensive test and evaluation of the Dalmo Victor TCAS 2 industry prototypes
[FAA/PM-862] p 705 N86-30712

**COLLOCATION**
Application of unsteady wing collocation methods to cascades in subsonic flow p 696 N86-30636

**COMBUSTION CHAMBERS**
National Transportation Safety Board safety recommendation
[NTSB-4360/33] p 699 N86-29791
Cooling techniques for turbojet pre-heater channels
p 741 N86-29847
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] p 723 N86-30735

**COMMERCIAL AIRCRAFT**
The selection and acquisition of commercial aircraft fleets p 686 A86-44935
Corporate flying, Italian style p 712 A86-45753
Avanti to fly soon p 713 A86-46405
Introduction to the recent developments of China's civil aviation
[AD-A166194] p 687 N86-29763
Aircraft accident report: Provincetown, Boston Airlines Flight 1039, Embraer Bandeirante, EMB-110P1, N96PB, Jacksonville, Florida, December 6, 1984
[PB86-910405] p 701 N86-30703
Comprehensive test and evaluation of the Dalmo Victor TCAS 2 industry prototypes
[FAA/PM-862] p 705 N86-30712

**COMPARISON**
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] p 697 N86-30694

**COMPATIBILITY**
Antimisting fuel technology for transport category aircraft p 733 N86-30008

**COMPENSATORS**
The design of multirate digital control systems
[NASA-CR-177126] p 726 N86-29863

**COMPONENT RELIABILITY**
Flight service evaluation of composite components on the Bell helicopter model 206L
[NASA-CR-178148] p 734 N86-30812

**COMPOSITE STRUCTURES**
Stability analysis of composite stiffened layer plates under compression p 735 A86-43495
Buckling and initial post buckling analysis of composite panels under axial compression p 735 A86-43496
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
The certification of airframes and components in metals and composites p 737 A86-43798
Variation of anisotropic behavior in structural optimization --- aircraft composite structures
p 715 N86-30656
Flight service evaluation of composite components on the Bell helicopter model 206L
[NASA-CR-178148] p 734 N86-30812

**COMPRESSIBLE FLOW**
Numerical solution of the supersonic laminar flow over a two-dimensional compression corner using an implicit approach p 690 A86-45054
Remarks on the development of a multiblock three-dimensional Euler code for out of core and multiprocessor calculations p 748 A86-46791
High resolution solutions of the Euler equations for vortex flows p 692 A86-46793
Pseudo-time algorithms for the Navier-Stokes equations [NASA-CR-178127] p 694 N86-29776

**COMPRESSION LOADS**
Optimization of stiffened panels under compression p 739 A86-45762

**COMPRESSOR ROTORS**
Role of shocks in transonic/supersonic compressor rotor flutter p 720 A86-44872
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856
Unsteady design-point flow phenomena in transonic compressors [NASA-CR-176879] p 722 N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor [AD-A166759] p 723 N86-30734

**COMPRESSORS**
National Transportation Safety Board safety recommendation [NTSB-4360/33] p 699 N86-29791

**COMPUTATION**
The influence of large-scale computing on aircraft structural design [AGARD-R-726] p 717 N86-30726

**COMPUTATIONAL FLUID DYNAMICS**
Some problems in the finite-difference computation of three-dimensional transonic flows p 687 A86-43501
Flows past a rotating circular cylinder at high Reynolds number p 688 A86-43533
Application of unsteady aerodynamics to large-eddy breakup devices in a turbulent flow p 688 A86-44238
Flow of real fluids --- Book p 737 A86-44801
The reverse-flow theorem for transonic flow p 688 A86-44802
On slender vortices p 689 A86-44810
Far-field boundary conditions for transonic lifting solutions to the Euler equations p 689 A86-44855
Integration of singular functions associated with lifting surface theory p 689 A86-44875
Computation of rotor blade flows using the Euler equations p 689 A86-44891
Calculation of the potential flow around wing profiles with the aid of a continuously differentiable vortex distribution p 689 A86-44979
Numerical solution of the supersonic laminar flow over a two-dimensional compression corner using an implicit approach p 690 A86-45054
The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem p 690 A86-45189
Scheme for calculating an almost-asymmetric gas flow and supersonic flow past the end of a cylinder at a small angle of attack p 690 A86-45345
Aerodynamics via acoustics - Application of acoustic formulas for aerodynamic calculations [AIAA PAPER 86-1877] p 691 A86-45494
Viscous-inviscid interaction solvers and computation of highly separated flows [ONERA, TP NO. 1986-4] p 691 A86-46152
Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method [ONERA, TP NO. 1986-29] p 692 A86-46171
Numerical calculations of inviscid transonic flows over wings p 692 A86-46415
Impact of supercomputers on the next decade of computational fluid dynamics p 740 A86-46788
Remarks on the development of a multiblock three-dimensional Euler code for out of core and multiprocessor calculations p 748 A86-46791
High resolution solutions of the Euler equations for vortex flows p 692 A86-46793
Analytical investigation of rotor wake formation and geometry [NASA-CR-177032] p 693 N86-29768
Vortex sheet modeling with higher order curved panels [NASA-CR-176971] p 693 N86-29770
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds [NASA-CR-176903] p 693 N86-29772
Experimental and theoretical study of propeller spinner/shank interference [NASA-CR-176954] p 694 N86-29773
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight [NASA-CR-176976] p 714 N86-29810
Transonic equivalent strip method for aeroelastic applications p 695 N86-30628
The method of complex characteristics for design of transonic blade sections [NASA-CR-176978] p 696 N86-30691
Numerical studies of porous airfoils in transonic flow [NASA-CR-179655] p 697 N86-30696
Aerodynamics of engine-airframe interaction [NASA-CR-179657] p 697 N86-30697
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach [NASA-CR-176947] p 722 N86-30731
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings --- conference [VKI-LS-1986-02] p 744 N86-30988
Navier-Stokes computations for circulation controlled airfoils [AIAA-85-1587] p 744 N86-30995
Navier-Stokes computations for exotic airfoils [AIAA-85-0109] p 745 N86-30996

**COMPUTATIONAL GRIDS**
Aerodynamics of engine-airframe interaction [NASA-CR-179657] p 697 N86-30697
Development of a numerical procedure to map a general 3-d body onto a near-circle p 749 N86-31420

**COMPUTER AIDED DESIGN**
Computer aided engineering in structural design and optimization p 736 A86-43759
Requirements and recommendations for the development of theoretical codes and experimental facilities in the near future --- for aircraft design [ONERA, TP NO. 1986-10] p 731 A86-46155

**COMPUTER GRAPHICS**
A graphic terminal for air traffic control of Canadian military airports p 703 A86-44399
Flight simulation p 730 A86-45137
Rectangular parallelepiped coding - A volumetric representation of three-dimensional objects p 747 A86-45473

**COMPUTER PROGRAMS**
Analytical investigation of rotor wake formation and geometry [NASA-CR-177032] p 693 N86-29768
PAN AIR application to the F-106B [NASA-CR-178165] p 698 N86-30698
The influence of large-scale computing on aircraft structural design [AGARD-R-726] p 717 N86-30726

**COMPUTER TECHNIQUES**
Decision aiding for tactical aircraft p 718 A86-46715

**COMPUTERIZED SIMULATION**
A computer model to evaluate airborne receiver performance in interference environments p 703 A86-43862
More accurate simulations of whole aircraft p 691 A86-45702
Practical considerations in optimal flight management computations p 713 A86-46458
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation [NASA-TM-88248] p 692 N86-29765
Development of an algorithm to model an aircraft equipped with a generic CDTI display [NASA-TM-87732] p 748 N86-30349
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families [NASA-CR-176883] p 697 N86-30693

**COMPUTERS**
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface [AD-A166899] p 705 N86-30714

**CONFERENCES**
Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 p 706 A86-43776
Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings p 709 A86-44936
Applications of artificial intelligence II; Proceedings of the Meeting, Arlington, VA, April 9-11, 1985 [SPIE-548] p 748 A86-46706
The Second International Symposium on Aeroelasticity and Structural Dynamics [DGLR-85-02] p 687 N86-30627
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings --- conference [VKI-LS-1986-02] p 744 N86-30988

**CONFORMAL MAPPING**
Development of a numerical procedure to map a general 3-d body onto a near-circle p 749 N86-31420

**CONICAL BODIES**
Correlation of transonic-cone preston-tube data and skin friction [NASA-CR-176902] p 693 N86-29771

**CONICS**
Geometerial description for a proposed aeroassist flight experiment vehicle [NASA-TM-87714] p 749 N86-31237

**CONJUGATE GRADIENT METHOD**
Variation of anisotropic behavior in structural optimization --- aircraft composite structures p 715 N86-30656

**CONSERVATION LAWS**
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices [NASA-CR-4004] p 745 N86-30999

**CONTRAROTATING PROPELLERS**
A study of the rotor/rotor interaction tones from a contra-rotating propeller driven aircraft [AIAA PAPER 86-1894] p 756 A86-45505

**CONTROL CONFIGURED VEHICLES**
An adaptive flight control system design for CCV with an unknown interactor matrix p 723 A86-43536
A discrete-time multivariable model-following method applied to decoupled flight control [AIAA PAPER 85-1978] p 725 A86-46454

**CONTROL EQUIPMENT**
Experimental study of flight effect on fan noise. I - A study of inflow control device for simulating in-flight fan noise in static test p 721 A86-46024
Robust detection, isolation and accommodation for sensor failures [NASA-CR-174825] p 722 N86-30732

**CONTROL ROCKETS**
Vectored thrust digital flight control for crew escape, volume 2 [AD-A166596] p 700 N86-29799

**CONTROL SIMULATION**
Design and research of aircraft parameter-adaptive lateral command augmentation systems p 723 A86-43498

**CONTROL STABILITY**
An optimal parameter estimation method compatible with stable parameter prediction in time domain p 746 A86-43482
The singular-G method for unstable non-minimum-phase plants p 747 A86-45736

**CONTROL SURFACES**
An iterative method for statically indeterminate structures of flight vehicle p 738 A86-45059

**CONTROL SYSTEMS DESIGN**
Application of adaptive control to aircraft systems p 746 A86-43476
Design and research of aircraft parameter-adaptive lateral command augmentation systems p 723 A86-43498
An adaptive flight control system design for CCV with an unknown interactor matrix p 723 A86-43536
Use of block-pulse functions in the optimal control of deterministic systems p 747 A86-45728
Digital control loading and motion - The final word? --- in flight simulation p 732 A86-46149
Disturbance attenuation by a frequency-shaped linear-quadratic-regulator method --- applied to design of feedback control system for aircraft gust alleviation p 725 A86-46453
A discrete-time multivariable model-following method applied to decoupled flight control [AIAA PAPER 85-1978] p 725 A86-46454
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology [NASA-CR-177080] p 721 N86-29810
Introduction to robust multivariable control [AD-A165891] p 727 N86-29869
A canonical form for nonlinear systems [NASA-CR-176974] p 746 N86-30371
Flutter calculation by a new program p 728 N86-30645
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques p 728 N86-30647
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 728 N86-30651

**CONTROL THEORY**
Controllability theory of discrete dynamic systems p 748 A86-46401
Development of control laws for a flight test maneuver autopilot p 725 A86-46460
Vectored thrust digital flight control for crew escape, volume 1 [AD-A166580] p 700 N86-29798
Vectored thrust digital flight control for crew escape, volume 2 [AD-A166596] p 700 N86-29799
Optimal landing of a helicopter in autorotation [NASA-CR-177062] p 714 N86-29809

Model-following control for an oblique-wing aircraft [NASA-TM-88269] p 726 N86-29867
Introduction to robust multivariable control [AD-A165891] p 727 N86-29869

CONTROLLABILITY
Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477
Controllability of redundant flight control system and pressure equalization of redundant servo actuators p 723 A86-43497
Controllability theory of discrete dynamic systems p 748 A86-46401
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461

CONTROLLED ATMOSPHERES
Fire extinguishing agents for oxygen-enriched atmospheres [AD-A166967] p 743 N86-30890

CONVERGENT-DIVERGENT NOZZLES
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles [NASA-TM-87757] p 697 N86-30694

COOLING
Self-retained platform cooling plate for turbine vane [AD-D012218] p 721 N86-29822

COOLING FINS
Self-retained platform cooling plate for turbine vane [AD-D012218] p 721 N86-29822
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins p 741 N86-29827

COOLING SYSTEMS
The effect of deposits on the cooling efficiency of gas-turbine engine blades p 720 A86-44697
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins p 741 N86-29827
A model for correlating flat plate film cooling effectiveness for rows of round holes p 741 N86-29840
Cooling techniques for turbojet pre-heater channels p 741 N86-29847
Heat exchangers in regenerative gas turbine cycles p 741 N86-29857
Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861

COORDINATES
A canonical form for nonlinear systems [NASA-CR-176974] p 748 N86-30371

CORNER FLOW
Numerical solution of the supersonic laminar flow over a two-dimensional compression corner using an implicit approach p 690 A86-45054

CORRECTION
An entropy correction method for unsteady full potential flows with strong shocks [NASA-TM-87769] p 694 N86-29777

COSMIC RAYS
Cosmic-ray dose characteristics on the flight paths of high-altitude aircraft p 758 A86-43672

COST REDUCTION
Structural modification by modal correction p 738 A86-44934
DOD overhauls maintenance p 758 A86-45703
LHX targets dollars as well as bogeys p 686 A86-45704

COUNTER-ROTATING WHEELS
Counter-rotating propeller noise directivity and trends [AIAA PAPER 86-1927] p 751 A86-45418

COUPLED MODES
Rapid vibration mode analysis of aircraft with external stores p 716 N86-30679

CRACK CLOSURE
A simple crack closure model for predicting fatigue crack growth under flight simulation loading p 737 A86-43796

CRACK PROPAGATION
Mode II fatigue crack growth specimen development p 736 A86-43566
The influence of slow growth and net section yielding on the residual strength of stiffened structure p 737 A86-43793
A simple crack closure model for predicting fatigue crack growth under flight simulation loading p 737 A86-43796
National Transportation Safety Board safety recommendation [NTSB-4357/1] p 699 N86-29792
Advances in the study of the mechanical behavior of materials [AD-A164656] p 735 N86-30838

CRACKS
A rationale for the safe operation of an aircraft fleet having known cracks in primary structure p 737 A86-43792

CRASH LANDING
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage [DOT/FAA/CT-85/35] p 700 N86-29795
Post Controlled Impact Demonstration (CID) analysis p 733 N86-30010
Antimisting kerosene: Evaluation of improved FM-9 additive [DOT/FAA/CT-85-4] p 734 N86-30024

CRASHES
Aircraft accident report: Provincetown, Boston Airlines Flight 1039, Embraer Bandeirante, EMB-110P1, N96PB, Jacksonville, Florida, December 6, 1984 [PB86-910405] p 701 N86-30703
Impact data from a transport aircraft during a controlled impact demonstration [NASA-TP-2589] p 716 N86-30721

CRASHWORTHINESS
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage [DOT/FAA/CT-85/35] p 700 N86-29795
Seat experiment results of full-scale transport aircraft controlled impact demonstration [DOT/FAA/CT-85/25] p 701 N86-30702
Crashworthiness of airframes [AGARD-R-737] p 702 N86-30709
Impact data from a transport aircraft during a controlled impact demonstration [NASA-TP-2589] p 716 N86-30721

CREWS
Task Force report on emergency evacuation of transport airplanes, volume 1 [DOT/FAA/VS-86/1.1] p 699 N86-29793

CROSS FLOW
Experimental results of the control of a vortical flow by tangential blowing [NASA-CR-176932] p 742 N86-30094

CROSSTALK
Sensitivity, noise and optical crosstalk in heterodyne acousto-optical signal processors p 740 A86-46701

CRUISING FLIGHT
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program [NASA-CR-178146] p 756 N86-30469

CRYOGENIC WIND TUNNELS
Cryogenic wind tunnels for high Reynolds number testing [NASA-TM-87743] p 731 N86-29872

CURVATURE
The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem p 690 A86-45189

CURVE FITTING
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds [NASA-CR-176903] p 693 N86-29772

CURVED PANELS
Buckling and initial post buckling analysis of composite panels under axial compression p 735 A86-43496

CYCLIC LOADS
Mode II fatigue crack growth specimen development p 736 A86-43566

CYLINDRICAL SHELLS
Active minimisation of acoustic potential energy in harmonically excited cylindrical enclosed sound fields [AIAA PAPER 86-1958] p 752 A86-45443

D

DAMAGE
Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 p 706 A86-43776
Fatigue and damage tolerance work during the aircraft design process p 706 A86-43777
Damage tolerance - USAF experience p 736 A86-43784
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
Damage tolerance test program of the Fokker 100 p 706 A86-43786
Continued airworthiness of damage tolerant aircraft p 707 A86-43788
Damage tolerance and durability in the design of a short-haul turboprop aircraft p 707 A86-43790
Maintenance system by means of damage tolerance principle p 736 A86-43791

DAMAGE ASSESSMENT
Propeller FOD qualification using modal analysis, artificial birds, and a static impact facility p 731 A86-47127

DATA ACQUISITION
Digital data acquisition system for modal testing --- of aircraft p 731 A86-47093
Analogue signal conditioning for flight test instrumentation [AGARD-AG-160-VOL-17] p 719 N86-29816

DATA BASES
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families [NASA-CR-176883] p 697 N86-30693

DATA CORRELATION
A survey of multiple targets tracking technique p 735 A86-43489

DATA PROCESSING TERMINALS
A graphic terminal for air traffic control of Canadian military airports p 703 A86-44399

DATA RECORDING
Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505

DC 10 AIRCRAFT
Practical considerations in optimal flight management computations p 713 A86-46458

DECISION MAKING
Decision aiding for tactical aircraft p 718 A86-46715

DECOUPLING
Flight test of a decoupler pylon for wing/store flutter suppression [NASA-TM-87767] p 714 N86-29814

DEFENSE INDUSTRY
The SKYEYE RPV - An NDI solution to today's unmanned aerial vehicle requirements p 712 A86-46134

DEFENSE PROGRAM
Fiscal year 1987 technical objective document [AD-A166659] p 758 N86-31454

DEGRADATION
Antimisting fuel technology for transport category aircraft p 733 N86-30008
AMK full-scale transport aircraft validation phase summary p 733 N86-30009
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013

DELAMINATING
Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures p 743 N86-30781

DELTA WINGS
Control of the discrete vortices from a delta wing [AIAA PAPER 86-1915] p 690 A86-45411
High resolution solutions of the Euler equations for vortex flows p 692 A86-46793
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds [NASA-CR-176903] p 693 N86-29772
An investigation of empennage buffeting [NASA-CR-176973] p 726 N86-29864
Active flutter suppression on a delta wing model structure [DFVLR-FB-86-01] p 727 N86-29870
Experimental results of the control of a vortical flow by tangential blowing [NASA-CR-176932] p 742 N86-30094

DEPOSITS
The effect of deposits on the cooling efficiency of gas-turbine engine blades p 720 A86-44697

DESIGN ANALYSIS
Optimizing the NOTAR design p 708 A86-44460
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel [NASA-TM-89011] p 715 N86-29815
Transmission line design for a power distribution system at 20 kHz for aircraft [NASA-CR-3987] p 721 N86-29818
The design of multirate digital control systems [NASA-CR-177126] p 726 N86-29863
Feasibility study for convertible engine torque converter [NASA-CR-175082] p 722 N86-30733

DETECTION
Auditory helicopter detection and localization; a literature review focusing on search for helicopters [FOA-C-50033-H2] p 757 N86-30474
Development of airborne electric field and lightning detection instrumentation for aviation safety [AD-A167342] p 701 N86-30705
Design, development and integrate/install an airborne remote instrumentation system (AIREYE) [AD-A166755] p 719 N86-30728

**DIGITAL COMMAND SYSTEMS**
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] p 714 N86-29813
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] p 726 N86-29866
**DIGITAL NAVIGATION**
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] p 714 N86-29813
**DIGITAL SYSTEMS**
Digital data acquisition system for modal testing --- of aircraft p 731 A86-47093
**DIGITAL TECHNIQUES**
Digital control loading and motion - The final word? --- in flight simulation p 732 A86-46149
The design of multirate digital control systems
[NASA-CR-177126] p 726 N86-29863
**DIRECTIVITY**
Pusher propeller noise directivity and trends
[AIAA PAPER 86-1929] p 751 A86-45420
Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] p 757 N86-31341
**DISPLAY DEVICES**
New levels of realism achieved in visuals for flight simulation p 739 A86-46148
Problems of the visual display in flight simulation p 731 A86-46719
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] p 714 N86-29811
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] p 748 N86-30349
Airborne navigation remote map reader evaluation
[AD-A166976] p 719 N86-30729
**DISTANCE MEASURING EQUIPMENT**
DME/P - A necessary MLS component for the future p 703 A86-46140
**DOORS**
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] p 700 N86-29797
**DOPPLER NAVIGATION**
Simulation of the algorithms of a navigation computer p 748 A86-46369
**DORNIER AIRCRAFT**
Aerodynamic technologies for general aviation aircraft p 713 A86-46198
**DRAG REDUCTION**
Application of unsteady aerodynamics to large-eddy breakup devices in a turbulent flow p 688 A86-44238
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] p 715 N86-29815
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] p 697 N86-30696
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] p 745 N86-30999
**DROP SIZE**
Olefin polymers as jet fuel antimist additives p 734 N86-30016
**DUCTED FLOW**
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] p 722 N86-30731
**DURABILITY**
Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 p 706 A86-43776
Damage tolerance and durability in the design of a short-haul turboprop aircraft p 707 A86-43790
**DYNAMIC CHARACTERISTICS**
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] p 719 N86-29817
**DYNAMIC STRUCTURAL ANALYSIS**
Sensitivity analysis of parameters in solving inverse problem of structural dynamics p 736 A86-43502
New modal identification methods applied to aeronautical structures
[ONERA, TP NO. 1986-35] p 713 A86-46177
Determining component loads and stresses with improved system modeling techniques p 740 A86-47122
Dynamic and flutter analysis using F.E.M. of the GP-180 --- turboprop aircraft p 713 A86-47128
The Second International Symposium on Aeroelasticity and Structural Dynamics
[DGLR-85-02] p 687 N86-30627
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 696 N86-30640
Flutter calculation by a new program p 728 N86-30645
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods p 743 N86-30646
Dynamic analysis of structures with flexible rotors --- aircraft engines p 722 N86-30664
Structural dynamic aspects of rotor nodal isolation --- helicopters p 715 N86-30665
Reconstruction of forcing functions based on measured structural responses p 732 N86-30684
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] p 698 N86-30700
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
**DYNAMICAL SYSTEMS**
Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144
Controllability theory of discrete dynamic systems p 748 A86-46401

**E**

**EAR PROTECTORS**
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] p 744 N86-30907
**EARPHONES**
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] p 744 N86-30907
**EIGENVALUES**
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] p 727 N86-29868
**EIGENVECTORS**
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] p 727 N86-29868
**EJECTION SEATS**
The Boeing crew escape technologies (CREST) program p 708 A86-44776
1985 USAF ejection summary p 698 A86-44777
Automatic Inflation Modulation (A.I.M.) parachute up-date p 698 A86-44781
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] p 700 N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] p 700 N86-29799
**EJECTORS**
Experiments on high speed ejectors
[NASA-CR-177419] p 721 N86-29820
**ELASTIC BENDING**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
**ELASTIC BODIES**
Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 696 N86-30640
**ELASTIC BUCKLING**
The vibration and stability of symmetrically-laminated composite rectangular plates subjected to in-plane stresses p 739 A86-45694
**ELASTIC CYLINDERS**
Active control of propeller induced noise fields inside a flexible cylinder
[AIAA PAPER 86-1957] p 711 A86-45442
**ELASTIC MEDIA**
Sound transmission through double panel constructions lined with elastic porous materials
[AIAA PAPER 86-1907] p 750 A86-45408
**ELASTIC WAVES**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
**ELASTODYNAMICS**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
**ELECTRICAL RESISTIVITY**
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725
**ELECTROMAGNETIC FIELDS**
Study of new flight test techniques
[NASA-CR-176952] p 714 N86-29812
**ELECTROMAGNETIC PULSES**
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] p 702 N86-30708
**ELECTRONIC EQUIPMENT TESTS**
Smart Built-In-Test (BIT) p 747 A86-43889
**ELECTRONIC MODULES**
Line replaceable modules - The next generation of avionics p 685 A86-43890
**ELECTROSTATIC CHARGE**
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725
**EMERGENCIES**
Task Force report on emergency evacuation of transport airplanes, volume 1
[DOT/FAA/VS-86/1.1] p 699 N86-29793
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1,2] p 700 N86-29797
**EMISSION SPECTRA**
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radient energy power source for jet aircraft
[DE86-007269] p 723 N86-30735
**ENGINE AIRFRAME INTEGRATION**
Structureborne noise investigations of a twin engine aircraft
[AIAA PAPER 86-1905] p 710 A86-45406
Arnold Engineering Development Center - New facility to assess engine-airframe compatibility prior to first flight p 730 A86-45674
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 697 N86-30697
**ENGINE COOLANTS**
Axisymmetric three-dimensional flow in the cooled gas turbine --- German thesis p 720 A86-44925
**ENGINE DESIGN**
Influence of turbine-engine design on flight safety p 720 A86-43939
The next hot fighter engine p 720 A86-44005
Rotary grows up p 720 A86-44007
Mechanical design of gas turbine blading in cast superalloys p 721 A86-45819
**ENGINE FAILURE**
Active suppression of compressor instabilities
[AIAA PAPER 86-1914] p 690 A86-45410
National Transportation Safety Board safety recommendation
[NTSB-4360/33] p 699 N86-29791
**ENGINE INLETS**
F-14A inlet icing p 709 A86-44937
**ENGINE NOISE**
Cabin noise characteristics of a small propeller powered aircraft
[AIAA PAPER 86-1906] p 710 A86-45407
A comparison of the structureborne and airborne paths for propfan interior noise
[AIAA PAPER 86-1863] p 711 A86-45483
Development of an impulsive noise source to study the acoustic reflection characteristics of hard-walled wind tunnels
[AIAA PAPER 86-1887] p 755 A86-45500
Propeller noise caused by blade tip radial forces
[AIAA PAPER 86-1892] p 721 A86-45504
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] p 756 N86-30469
**ENGINE PARTS**
Precision casting of aero gas turbine components p 739 A86-45816
Superalloy component durability enhancements p 739 A86-46562
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838
**ENGINE TESTS**
Development of in-flight thrust measurement procedures for an afterburning turbofan engine
[AIAA PAPER 85-1405] p 720 A86-45375
**ENTROPY**
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] p 694 N86-29777
**ENVIRONMENT PROTECTION**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728
**ENVIRONMENTAL CONTROL**
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838
**ENVIRONMENTAL MONITORING**
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] p 705 N86-30715

**EQUATIONS OF MOTION**
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] p 714 N86-29810
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] p 726 N86-29867
Flutter calculation by a new program
p 728 N86-30645
**EQUIPMENT SPECIFICATIONS**
Study of new flight test techniques
[NASA-CR-176952] p 714 N86-29812
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] p 742 N86-30090
High accuracy fuel flowmeter
[NASA-CR-174869] p 745 N86-31030
**ERROR ANALYSIS**
Gravity-induced errors in airborne inertial navigation
p 703 A86-46457
**ERROR CORRECTING DEVICES**
A system for introducing mutual corrections into the airborne temperature and air-speed meters
p 738 A86-45208
**ESCAPE ROCKETS**
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] p 700 N86-29799
**ESCAPE SYSTEMS**
The Boeing crew escape technologies (CREST) program p 708 A86-44776
1985 USAF ejection summary p 698 A86-44777
**ESTIMATORS**
Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] p 722 N86-30732
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 749 N86-31265
**EULER EQUATIONS OF MOTION**
Far-field boundary conditions for transonic lifting solutions to the Euler equations p 689 A86-44855
Computation of rotor blade flows using the Euler equations p 689 A86-44891
Remarks on the development of a multiblock three-dimensional Euler code for out of core and multiprocessor calculations p 748 A86-46791
High resolution solutions of the Euler equations for vortex flows p 692 A86-46793
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 697 N86-30697
**EUROPEAN AIRBUS**
Airbus Industrie A310 and A300-600 experience with practical applications of damage tolerance design in fuselage primary structure p 707 A86-43787
**EXHAUST GASES**
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
**EXHAUST NOZZLES**
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] p 716 N86-30722
**EXPERIMENT DESIGN**
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] p 697 N86-30694
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] p 701 N86-30702
**EXPERIMENTATION**
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[AIAA PAPER 86-1966] p 711 A86-45449
**EXPERT SYSTEMS**
Expert systems for mechanical fault diagnosis
p 737 A86-43896
Applications of artificial intelligence II; Proceedings of the Meeting, Arlington, VA, April 9-11, 1985
[SPIE-548] p 748 A86-46706
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718
**EXTERNAL STORE SEPARATION**
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
Store seperation flight testing
[AGARD-AG-300-VOL-5] p 717 N86-30727
**EXTERNAL STORES**
Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] p 714 N86-29814
A review of aeroelastic research at the Flight Dynamics Laboratory p 727 N86-30642
Rapid vibration mode analysis of aircraft with external stores p 716 N86-30679
**EXTINGUISHING**
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] p 743 N86-30890

## F

**F-104 AIRCRAFT**
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] p 729 N86-30738
**F-106 AIRCRAFT**
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233
PAN AIR application to the F-106B
[NASA-CR-178165] p 698 N86-30698
**F-14 AIRCRAFT**
F-14A inlet icing p 709 A86-44937
Navy departure/spin and air combat maneuvering evaluation of a National Aeronautics and Space Administration developed flight control system for the F-14 p 724 A86-44944
**F-15 AIRCRAFT**
Development of control laws for a flight test maneuver autopilot p 725 A86-46460
**F-16 AIRCRAFT**
Digital data acquisition system for modal testing --- of aircraft p 731 A86-47093
**F-18 AIRCRAFT**
An investigation of empennage buffeting
[NASA-CR-176973] p 726 N86-29864
**F-20 AIRCRAFT**
Built In Test (BIT) utilization for improved supportability of the F-20 aircraft p 685 A86-43906
**FABRICATION**
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] p 715 N86-29815
**FACTORIZATION**
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] p 694 N86-29777
**FAILURE ANALYSIS**
Mode II fatigue crack growth specimen development
p 736 A86-43566
Expert systems for mechanical fault diagnosis
p 737 A86-43896
**FAILURE MODES**
Mode II fatigue crack growth specimen development
p 736 A86-43566
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718
**FALSE ALARMS**
Smart Built-In-Test (BIT) p 747 A86-43889
Built In Test (BIT) utilization for improved supportability of the F-20 aircraft p 685 A86-43906
**FAN BLADES**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
High speed rotor noise due to blade loading
[AIAA PAPER 86-1902] p 750 A86-45403
Experimental investigation of unsteady fan flow interaction with downstream struts
[AIAA PAPER 86-1870] p 739 A86-45490
National Transportation Safety Board safety recommendation
[NTSB-4360/33] p 699 N86-29791
**FANS**
Feasibility study for convertible engine torque converter
[NASA-CR-175082] p 722 N86-30733
**FAR FIELDS**
Far-field boundary conditions for transonic lifting solutions to the Euler equations p 689 A86-44855
The near and far acoustic fields of broadband shock associated noise
[AIAA PAPER 86-1943] p 751 A86-45430
**FATIGUE LIFE**
Fatigue and damage tolerance work during the aircraft design process p 706 A86-43777
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 738 A86-45256
**FATIGUE TESTS**
The significance of flight-simulation fatigue tests
p 706 A86-43779
A simple crack closure model for predicting fatigue crack growth under flight simulation loading
p 737 A86-43796
Ultrasonic direct backscattering technique for material surface inspection p 740 A86-47133
**FEASIBILITY ANALYSIS**
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482
The black box. Silence is silver, speech is golden
[ESA-86-97394] p 702 N86-30706
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] p 757 N86-31337
**FEEDBACK CONTROL**
On a method for pilot dynamics identification reflecting feedback structures p 747 A86-43511
The singular-G method for unstable non-minimum-phase plants p 747 A86-45736
Disturbance attenuation by a frequency-shaped linear-quadratic-regulator method --- applied to design of feedback control system for aircraft gust alleviation
p 725 A86-46453
Multi-variable control of the GE T700 engine using the LOG/LTR design methodology
[NASA-CR-177080] p 721 N86-29819
A canonical form for nonlinear systems
[NASA-CR-176974] p 748 N86-30371
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 749 N86-31265
**FIBER OPTICS**
Fiber optic sensors for flexure measurement of aircraft structures p 739 A86-46135
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007269] p 723 N86-30735
**FIGHTER AIRCRAFT**
Rafale will keep tricolor flying --- experimental combat aircraft p 707 A86-44003
New technologies for a European fighter
p 708 A86-44004
The next hot fighter engine p 720 A86-44005
Doubling the Air Force through greater reliability
p 685 A86-44006
1985 USAF ejection summary p 698 A86-44777
New technologies offer quantum leap in future fighter capabilities p 686 A86-45063
British experimental aircraft program providing insight into new technology p 710 A86-45064
NASA's Langley Center making gains in advanced technology projects p 686 A86-45065
Crew situational awareness drives avionics developments p 718 A86-45067
More than a Mirage p 712 A86-45758
A come-back in canards p 712 A86-46125
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764
Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] p 700 N86-29798
Vectored thrust digital flight control for crew escape, volume 2
[AD-A166596] p 700 N86-29799
Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds
[NASA-TM-87755] p 697 N86-30695
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741
**FILM COOLING**
A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
**FINES**
Olefin polymers as jet fuel antimist additives
p 734 N86-30016
**FINITE DIFFERENCE THEORY**
Some problems in the finite-difference computation of three-dimensional transonic flows p 687 A86-43501
**FINITE ELEMENT METHOD**
Stability analysis of composite stiffened layer plates under compression p 735 A86-43495
Modelling of acoustic radiation problems associated with turbomachinery and rotating blades p 749 A86-44805
Prediction of structure-borne noise, based on the finite element method
[AIAA PAPER 86-1861] p 754 A86-45481
Incremental and iterative methods for solving fluid/structure interaction problems p 740 A86-47011
Dynamic and flutter analysis using F.E.M. of the GP-180 --- turboprop aircraft p 713 A86-47128

Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods p 743 N86-30646

A study of methods to predict and measure the transmission of sound through the walls of light aircraft [NASA-CR-177147] p 757 N86-31335

**FINITE VOLUME METHOD**

Thermodynamic evaluation of transonic compressor rotors using the finite volume approach [NASA-CR-176947] p 722 N86-30731

**FIRE CONTROL**

A simulation of an integrated flight control/air-ground cannon firing system [ONERA, TP NO. 1986-31] p 725 A86-46173

**FIRE EXTINGUISHERS**

Halon extinguisher agent behavior in a ventilated small aircraft [DOT/FAA/CT-86/5] p 699 N86-29794

Fire extinguishing agents for oxygen-enriched atmospheres [AD-A166967] p 743 N86-30890

**FIRE FIGHTING**

Halon extinguisher agent behavior in a ventilated small aircraft [DOT/FAA/CT-86/5] p 699 N86-29794

**FIRE PREVENTION**

The fire-hard airliner p 698 A86-44400

Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage [DOT/FAA/CT-85/35] p 700 N86-29795

Proceedings of Fuel Safety Workshop [DOT/FAA/PM-86/13] p 733 N86-30007

Antimisting fuel technology for transport category aircraft p 733 N86-30008

AMK full-scale transport aircraft validation phase summary p 733 N86-30009

Post Controlled Impact Demonstration (CID) analysis p 733 N86-30010

FAA fuel containment R and D p 733 N86-30011

AMK: Still viable? p 734 N86-30017

Current design procedures for minimizing post crash fire hazards p 700 N86-30019

Amine-CO2 adducts as aviation fuel gelling agents p 701 N86-30020

GTA/BASF antimisting fuel research p 734 N86-30021

Antimisting kerosene: Evaluation of improved FM-9 additive [DOT/FAA/CT-85-4] p 734 N86-30024

**FIRES**

The fire-hard airliner p 698 A86-44400

Fire extinguishing agents for oxygen-enriched atmospheres [AD-A166967] p 743 N86-30890

**FLAMMABILITY**

Antimisting fuel technology for transport category aircraft p 733 N86-30008

**FLAPS (CONTROL SURFACES)**

Flap-lag-torsional dynamics of helicopter rotor blades in forward flight [NASA-CR-176976] p 714 N86-29810

**FLAT PLATES**

Ultrasonic direct backscattering technique for material surface inspection p 740 A86-47133

Boundary layer stability measurements over a flat plate at mach 3 [AD-A166188] p 694 N86-29778

A model for correlating flat plate film cooling effectiveness for rows of round holes p 741 N86-29840

Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system [AD-A166888] p 698 N86-30700

**FLEXIBLE BODIES**

Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 728 N86-30651

**FLEXIBLE WINGS**

Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 696 N86-30639

**FLIGHT CONDITIONS**

The effect of rain and contamination of the front surface on the in-flight behavior of aircraft during roll. II p 688 A86-43938

**FLIGHT CONTROL**

Controllability of redundant flight control system and pressure equalization of redundant servo actuators p 723 A86-43497

An adaptive flight control system design for CCV with an unknown interactor matrix p 723 A86-43536

Flight testing of the navigation and flight control complexes of aircraft and helicopters --- Russian book p 708 A86-44283

Navy departure/spin and air combat maneuvering evaluation of a National Aeronautics and Space Administration developed flight control system for the F-14 p 724 A86-44944

A320 flight controls p 724 A86-44946

A simulation of an integrated flight control/air-ground cannon firing system [ONERA, TP NO. 1986-31] p 725 A86-46173

A discrete-time multivariable model-following method applied to decoupled flight control [AIAA PAPER 85-1978] p 725 A86-46454

Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft [NASA-TM-88265] p 714 N86-29813

Experience with synchronous and asynchronous digital control systems [NASA-TM-88271] p 726 N86-29866

Model-following control for an oblique-wing aircraft [NASA-TM-88269] p 726 N86-29867

Introduction to robust multivariable control [AD-A165891] p 727 N86-29869

A.I.-based real-time support for high performance aircraft operations [NASA-CR-176906] p 716 N86-30718

The integrated manual and atuomatic control of complex flight systems [NASA-CR-176940] p 729 N86-30737

**FLIGHT CREWS**

The Boeing crew escape technologies (CREST) program p 708 A86-44776

**FLIGHT HAZARDS**

Cosmic-ray dose characteristics on the flight paths of high-altitude aircraft p 758 A86-43672

An approximate model of vortex decay in the atmosphere p 689 A86-44889

Wind-shear detection - A report on the first such airborne warning device to be commercially certified p 718 A86-46139

Investigation of hazards of helicopter operations and root causes of helicopter accidents [FAA/PM-86/28] p 700 N86-29796

**FLIGHT INSTRUMENTS**

Development of airborne electric field and lightning detection instrumentation for aviation safety [AD-A167342] p 701 N86-30705

**FLIGHT MANAGEMENT SYSTEMS**

Practical considerations in optimal flight management computations p 713 A86-46458

**FLIGHT MECHANICS**

Optimal take-off trajectories in the presence of windshear p 708 A86-44386

**FLIGHT OPTIMIZATION**

Flight testing the Voyager - A non-stop, unrefueled, around-the-world aircraft p 710 A86-44948

**FLIGHT PATHS**

Calculation of the explosion of a rapidly flying body p 738 A86-45344

**FLIGHT RECORDERS**

The black box. Silence is silver, speech is golden [ESA-86-97394] p 702 N86-30706

**FLIGHT RULES**

The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways [AD-A166485] p 704 N86-29804

**FLIGHT SAFETY**

Influence of turbine-engine design on flight safety p 720 A86-43939

LLWAS - An integral part of the U.S. wind-shear safety programme p 746 A86-46138

ILS goal - Automatic landings, safety p 703 A86-46142

Experience with synchronous and asynchronous digital control systems [NASA-TM-88271] p 726 N86-29866

**FLIGHT SIMULATION**

The significance of flight-simulation fatigue tests p 706 A86-43779

Flight simulation p 730 A86-45137

New levels of realism achieved in visuals for flight simulation p 739 A86-46148

Digital control loading and motion - The final word? --- in flight simulation p 732 A86-46149

Practical considerations in optimal flight management computations p 713 A86-46458

Development of an algorithm to model an aircraft equipped with a generic CDTI display [NASA-TM-87732] p 748 N86-30349

**FLIGHT SIMULATORS**

Improvement of servo systems for flight simulator p 706 A86-43487

Flight simulation p 730 A86-45137

Problems of the visual display in flight simulation p 731 A86-46719

The integrated manual and atuomatic control of complex flight systems [NASA-CR-176940] p 729 N86-30737

**FLIGHT TEST VEHICLES**

X-wing rotor systems test vehicle scheduled for flight in October p 707 A86-44001

**FLIGHT TESTS**

Propelling the aerospace plane p 720 A86-43910

Flight testing of the navigation and flight control complexes of aircraft and helicopters --- Russian book p 708 A86-44283

Society of Experimental Test Pilots, Symposium, 29th, Beverly Hills, CA, September 25-28, 1985, Proceedings p 709 A86-44936

The XV-15 Tilt-Rotor flight-test program p 709 A86-44938

Boeing 737-300 flight test and the first nine months service experience p 709 A86-44940

X-29 initial flight test results p 709 A86-44942

AV-8B high angle of attack/spin program p 710 A86-44943

Tornado high speed terrain following testing in mountainous terrain and bad weather p 710 A86-44945

Certification flight testing of civilian helicopters in the United Kingdom p 710 A86-44947

Flight testing the Voyager - A non-stop, unrefueled, around-the-world aircraft p 710 A86-44948

Aerobatic testing of the BK-117 helicopter p 710 A86-44950

Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459

Development of control laws for a flight test maneuver autopilot p 725 A86-46460

Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461

Technology research for strapdown inertial experiment and digital flight control and guidance [NASA-CR-176907] p 703 N86-29800

Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17 [FAA/PM-86/24] p 704 N86-29802

Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft [NASA-TM-88265] p 714 N86-29813

Flight test of a decoupler pylon for wing/store flutter suppression [NASA-TM-87767] p 714 N86-29814

Analogue signal conditioning for flight test instrumentation [AGARD-AG-160-VOL-17] p 719 N86-29816

Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees [NASA-CR-176962] p 726 N86-29865

Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program [NASA-CR-178146] p 756 N86-30469

The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 p 728 N86-30644

Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods p 743 N86-30646

Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system [AD-A166888] p 698 N86-30700

Store separation flight testing [AGARD-AG-300-VOL-5] p 717 N86-30727

Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft [NASA-CR-176990] p 729 N86-30736

The integrated manual and atuomatic control of complex flight systems [NASA-CR-176940] p 729 N86-30737

Flight service evaluation of composite components on the Bell helicopter model 206L [NASA-CR-178148] p 734 N86-30812

Determination of antennae patterns and radar reflection characteristics of aircraft [AGARD-AG-300-VOL-4] p 744 N86-30931

**FLIGHT TRAINING**

Northrop's surrogate trainer --- simulating AH-64A helicopter p 709 A86-44941

**FLIP-FLOPS**

Advanced laser based inertial instrument development [AD-A166307] p 742 N86-30128

**FLOORS**

Effects of an internal floor on low frequency sound transmission into aircraft cabins - An experimental investigation [AIAA PAPER 86-1939] p 711 A86-45426

Structural influence of cabin floor on sound transmission into propeller aircraft - Analytical investigations [AIAA PAPER 86-1940] p 711 A86-45427

**FLOQUET THEOREM**
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] p 714 N86-29810
**FLOW CHARACTERISTICS**
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
**FLOW DEFLECTION**
Scheme for calculating an almost-asymmetric gas flow and supersonic flow past the end of a cylinder at a small angle of attack p 690 A86-45345
**FLOW DISTORTION**
Experimental study of flight effect on fan noise. I - A study of inflow control device for simulating in-flight fan noise in static test p 721 A86-46024
**FLOW DISTRIBUTION**
10 years of rotor flows studies at ONERA - State of the art and future studies
[ONERA, TP NO. 1986-49] p 692 A86-46185
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] p 693 N86-29772
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782
Wake-passing in a turbine rotor cascade
p 741 N86-29830
A numerical analysis for vertical gust field induced by gust generator p 727 N86-30637
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 697 N86-30697
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] p 722 N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor
[AD-A166759] p 723 N86-30734
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] p 745 N86-31010
**FLOW EQUATIONS**
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] p 697 N86-30696
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 697 N86-30697
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] p 722 N86-30731
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings --- conference
[VKI-LS-1986-02] p 744 N86-30988
**FLOW GEOMETRY**
On slender vortices p 689 A86-44810
Scheme for calculating an almost-asymmetric gas flow and supersonic flow past the end of a cylinder at a small angle of attack p 690 A86-45345
Coherent large-scale structures in high Reynolds number supersonic jet of Mach number 1.4
[AIAA PAPER 86-1941] p 691 A86-45428
**FLOW MEASUREMENT**
Flow of real fluids --- Book p 737 A86-44801
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow
p 695 N86-30632
High accuracy fuel flowmeter
[NASA-CR-174869] p 745 N86-31030
**FLOW THEORY**
The reverse-flow theorem for transonic flow
p 688 A86-44802
Integration of singular functions associated with lifting surface theory p 689 A86-44875
**FLOW VELOCITY**
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 695 N86-30631
**FLOW VISUALIZATION**
Coherent large-scale structures in high Reynolds number supersonic jet of Mach number 1.4
[AIAA PAPER 86-1941] p 691 A86-45428
Wake-passing in a turbine rotor cascade
p 741 N86-29830
**FLOWMETERS**
High accuracy fuel flowmeter
[NASA-CR-174869] p 745 N86-31030
**FLUID FLOW**
Flow of real fluids --- Book p 737 A86-44801
**FLUID MECHANICS**
Flow of real fluids --- Book p 737 A86-44801
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] p 745 N86-30999
**FLUID-SOLID INTERACTIONS**
Incremental and iterative methods for solving fluid/structure interaction problems p 740 A86-47011
**FLUTTER**
A comparison of methods for aircraft ground vibration testing p 713 A86-47096
Multi shaker modal testing using a modified transient random excitation p 740 A86-47107
Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] p 714 N86-29814
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques p 726 N86-30647
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 728 N86-30650
**FLUTTER ANALYSIS**
Role of shocks in transonic/supersonic compressor rotor flutter p 720 A86-44872
The role of structural and aerodynamic damping on the aeroelastic behavior of wings p 708 A86-44894
Aircraft flutter analysis (The Fourth John Weston Memorial Lecture) p 724 A86-44932
Identification of aeroelastic phenomenon employing bispectral analysis techniques p 740 A86-47124
Dynamic and flutter analysis using F.E.M. of the GP-180 --- turboprop aircraft p 713 A86-47128
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] p 695 N86-29786
Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] p 727 N86-29868
Application of transonic unsteady methods for calculation of flutter airloads p 727 N86-30630
Theoretical flutter investigations on a plane cascade in incompressible flow --- axial flow compressors and turbines p 727 N86-30635
A review of aeroelastic research at the Flight Dynamics Laboratory p 727 N86-30642
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125
p 728 N86-30644
Flutter calculation by a new program
p 728 N86-30645
**FLY BY WIRE CONTROL**
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] p 714 N86-29813
**FLYING PERSONNEL**
1985 USAF ejection summary p 698 A86-44777
**FLYING PLATFORMS**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908
**FOAMS**
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] p 757 N86-31335
**FOKKER AIRCRAFT**
Damage tolerance test program of the Fokker 100
p 706 A86-43786
**FORCED VIBRATION**
Vibration analysis of a helicopter fuselage by means of mathematical models p 725 A86-46368
Reconstruction of forcing functions based on measured structural responses p 732 N86-30684
**FRACTURE MECHANICS**
Fracture diagrams for stiffened aircraft structures - Effects of material non-linearity p 737 A86-43794
**FRANCE**
More than a Mirage p 712 A86-45758
**FREQUENCY HOPPING**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908
**FREQUENCY MODULATION**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908
**FRICTION**
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013
**FUEL CONSUMPTION**
Heat exchangers in regenerative gas turbine cycles
p 741 N86-29857
Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families
[NASA-CR-176883] p 697 N86-30693
**FUEL PRODUCTION**
Antimisting fuel technology for transport category aircraft p 733 N86-30008
**FUEL SYSTEMS**
AMK full-scale transport aircraft validation phase summary p 733 N86-30009
UK work on safety fuels p 733 N86-30012
Current design procedures for minimizing post crash fire hazards p 700 N86-30019
**FUEL TANKS**
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] p 716 N86-30719
Liquid hydrogen fueled passenger aircraft
[AD-A166229] p 717 N86-30724
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725
**FUEL TESTS**
Antimisting fuel technology for transport category aircraft p 733 N86-30008
AMK full-scale transport aircraft validation phase summary p 733 N86-30009
Post Controlled Impact Demonstration (CID) analysis
p 733 N86-30010
UK work on safety fuels p 733 N86-30012
AMK: Still viable? p 734 N86-30017
**FULL SCALE TESTS**
Aircraft noise measurement - Alternatives to the standard 1-2 metres microphone height
[AIAA PAPER 86-1960] p 752 A86-45445
**FUSELAGES**
Airbus Industrie A310 and A300-600 experience with practical applications of damage tolerance design in fuselage primary structure p 707 A86-43787
Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401
Vibration analysis of a helicopter fuselage by means of mathematical models p 725 A86-46368

**G**

**GAS CHROMATOGRAPHY**
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821
**GAS DETECTORS**
Sniffing out trouble p 699 A86-45757
**GAS DYNAMICS**
Calculation of the explosion of a rapidly flying body
p 738 A86-45344
**GAS FLOW**
Scheme for calculating an almost-asymmetric gas flow and supersonic flow past the end of a cylinder at a small angle of attack p 690 A86-45345
**GAS INJECTION**
A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
**GAS TURBINE ENGINES**
Influence of turbine-engine design on flight safety
p 720 A86-43939
The effect of deposits on the cooling efficiency of gas-turbine engine blades p 720 A86-44697
Precision casting of aero gas turbine components
p 739 A86-45816
Mechanical design of gas turbine blading in cast superalloys p 721 A86-45819
Wake-passing in a turbine rotor cascade
p 741 N86-29830
A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856
Heat exchangers in regenerative gas turbine cycles
p 741 N86-29857
**GAS TURBINES**
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins
p 741 N86-29827
Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454

**GASES**
Halon extinguisher agent behavior in a ventilated small aircraft
[DOT/FAA/CT-86/5] p 699 N86-29794
**GEARS**
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 738 A86-45256
**GELS**
Amine-CO2 adducts as aviation fuel gelling agents p 701 N86-30020
**GENERAL AVIATION AIRCRAFT**
Aerodynamic technologies for general aviation aircraft p 713 A86-46198
Halon extinguisher agent behavior in a ventilated small aircraft
[DOT/FAA/CT-86/5] p 699 N86-29794
**GEOMETRY**
PAN AIR application to the F-106B
[NASA-CR-178165] p 698 N86-30698
Geometerial description for a proposed aeroassist flight experiment vehicle
[NASA-TM-87714] p 749 N86-31237
**GLIDE PATHS**
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801
**GLIDERS**
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] p 726 N86-29865
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane p 715 N86-30662
**GLOBAL POSITIONING SYSTEM**
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] p 704 N86-29805
**GOGGLES**
Liquid-crystal goggles permit visual simulations of restricted visibility p 718 A86-46150
**GRAVITATIONAL EFFECTS**
Gravity-induced errors in airborne inertial navigation p 703 A86-46457
**GROUND BASED CONTROL**
The SKYEYE RPV - An NDI solution to today's unmanned aerial vehicle requirements p 712 A86-46134
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] p 704 N86-29805
**GROUND CREWS**
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] p 744 N86-30907
**GROUND EFFECT (AERODYNAMICS)**
Lifting-line solution for a symmetrical thin wing in ground effect p 689 A86-44874
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782
**GROUND RESONANCE**
Ground resonance of a helicopter during the take-off and landing run p 712 A86-45749
**GROUND STATIONS**
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801
**GROUND TESTS**
Arnold Engineering Development Center - Simulators encompass spectrum of aerospace environments p 730 A86-45673
Arnold Engineering Development Center - New facility to assess engine-airframe compatibility prior to first flight p 730 A86-45674
The methods implemented at ONERA to improve airplane ground vibration tests
[ONERA, TP NO. 1986-8] p 713 A86-46153
Digital data acquisition system for modal testing --- of aircraft p 731 A86-47093
A comparison of methods for aircraft ground vibration testing p 713 A86-47096
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125 p 728 N86-30644
Experience with aeroelastic analysis of a single engine turbo trainer using finite element methods p 743 N86-30646
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing p 743 N86-30669
Modified US Army U-8F ground vibration test
[NASA-TM-86741] p 717 N86-30723
**GRUMMAN AIRCRAFT**
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing p 715 N86-30654
**GUST ALLEVIATORS**
Disturbance attenuation by a frequency-shaped linear-quadratic-regulator method --- applied to design of feedback control system for aircraft gust alleviation p 725 A86-46453
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model p 728 N86-30649
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 728 N86-30651
**GUST LOADS**
A numerical analysis for vertical gust field induced by gust generator p 727 N86-30637
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model p 728 N86-30649
The design and wind tunnel demonstration of an active control system for gust load alleviation and flutter suppression p 728 N86-30650
Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 728 N86-30651
**GUSTS**
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] p 746 N86-30285
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741

## H

**HARMONIC ANALYSIS**
Application of harmonic analysis method to research on rotor airloads p 706 A86-43490
**HARRIER AIRCRAFT**
AV-8B high angle of attack/spin program p 710 A86-44943
Control of V/STOL aircraft p 724 A86-46002
**HAZARDS**
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] p 704 N86-29806
**HEAT EXCHANGERS**
Heat exchangers in regenerative gas turbine cycles p 741 N86-29857
Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858
**HEAT MEASUREMENT**
Measurements of fluctuations of surface heat transfer rate in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43512
**HEAT RESISTANT ALLOYS**
Mechanical design of gas turbine blading in cast superalloys p 721 A86-45819
Superalloy component durability enhancements p 739 A86-46562
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838
**HEAT TRANSFER**
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins p 741 N86-29827
Wake-passing in a turbine rotor cascade p 741 N86-29830
A model for correlating flat plate film cooling effectiveness for rows of round holes p 741 N86-29840
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013
**HEATING**
Cooling techniques for turbojet pre-heater channels p 741 N86-29847
**HELICOPTER CONTROL**
Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477
Flight testing of the navigation and flight control complexes of aircraft and helicopters --- Russian book p 708 A86-44283
Vibration analysis of a helicopter fuselage by means of mathematical models p 725 A86-46368
**HELICOPTER DESIGN**
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
Optimizing the NOTAR design p 708 A86-44460
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] p 745 N86-31070
**HELICOPTER ENGINES**
Expert systems for mechanical fault diagnosis p 737 A86-43896
Heat exchangers in regenerative gas turbine cycles p 741 N86-29857
**HELICOPTER PERFORMANCE**
Certification flight testing of civilian helicopters in the United Kingdom p 710 A86-44947
Aerobatic testing of the BK-117 helicopter p 710 A86-44950
The dynamics of limiting helicopter maneuvers at a very low altitude p 724 A86-45748
Ground resonance of a helicopter during the take-off and landing run p 712 A86-45749
Soviet attack helicopters p 712 A86-46005
**HELICOPTER TAIL ROTORS**
Optimizing the NOTAR design p 708 A86-44460
Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401
**HELICOPTER WAKES**
Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401
**HELICOPTERS**
Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505
Application of the Baseline Rotonet system to the prediction of helicopter tone noise
[AIAA PAPER 86-1904] p 750 A86-45405
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] p 693 N86-29788
National Transportation Safety Board safety recommendation
[NTSB-4357/1] p 699 N86-29792
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] p 700 N86-29796
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] p 703 N86-29800
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] p 714 N86-29809
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology
[NASA-CR-177080] p 721 N86-29819
A new version of the helicopter aural detection program, ICHIN
[NASA-TM-87745] p 756 N86-30471
Auditory helicopter detection and localization; a literature review focusing on search for helicopters
[FOA-C-50033-H2] p 757 N86-30474
Structural dynamic aspects of rotor nodal isolation --- helicopters p 715 N86-30665
Flight service evaluation of composite components on the Bell helicopter model 206L
[NASA-CR-178148] p 734 N86-30812
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] p 757 N86-31337
**HIGH ALTITUDE**
Cosmic-ray dose characteristics on the flight paths of high-altitude aircraft p 758 A86-43672
**HIGH POLYMERS**
GTA/BASF antimisting fuel research p 734 N86-30021
**HIGH REYNOLDS NUMBER**
Flows past a rotating circular cylinder at high Reynolds number p 688 A86-43533
Coherent large-scale structures in high Reynolds number supersonic jet of Mach number 1.4
[AIAA PAPER 86-1941] p 691 A86-45428
**HIGH SPEED**
Calculation of the explosion of a rapidly flying body p 738 A86-45344
High speed rotor noise due to blade loading
[AIAA PAPER 86-1902] p 750 A86-45403
Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] p 757 N86-31338
**HIGH STRENGTH ALLOYS**
Developments in premium high-strength powder metallurgy alloys by Kaiser Aluminum p 733 A86-46842
**HIGH TEMPERATURE ENVIRONMENTS**
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838

**HIGH TEMPERATURE GASES**
The effect of deposits on the cooling efficiency of gas-turbine engine blades p 720 A86-44697
**HIGH TEMPERATURE LUBRICANTS**
Carbon residue studies with a microcarbon residue tester
[ASLE PREPRINT 86-AM-7A-1] p 732 A86-45395
**HIGHLY MANEUVERABLE AIRCRAFT**
NASA's Langley Center making gains in advanced technology projects p 686 A86-45065
**HISTORIES**
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764
**HODOGRAPHS**
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 695 N86-30631
**HOLE GEOMETRY (MECHANICS)**
A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
**HOMING**
Comparison of angular and metric guidance laws for tactical missiles p 726 A86-46469
**HORIZONTAL ORIENTATION**
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] p 719 N86-29817
**HOVERING**
The dynamics of limiting helicopter maneuvers at a very low altitude p 724 A86-45748
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] p 693 N86-29769
**HUMAN FACTORS ENGINEERING**
The Boeing crew escape technologies (CREST) program p 708 A86-44776
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] p 714 N86-29811
**HUMAN PERFORMANCE**
Development of an algorithm to model an aircraft equipped with a generic CDTI display
[NASA-TM-87732] p 748 N86-30349
**HYDRAULIC CONTROL**
Controllability of redundant flight control system and pressure equalization of redundant servo actuators
p 723 A86-43497
Aircraft hydraulic systems: An introduction to the analysis of systems and components --- Book
p 713 A86-46850
**HYDRODYNAMICS**
Development of a numerical procedure to map a general 3-d body onto a near-circle p 749 N86-31420
**HYDROGEN FUELS**
Investigation of the ignition characteristics of hydrogen/air mixtures in the case of combustion induced by oblique shocks p 732 A86-45185
Liquid hydrogen fueled passenger aircraft
[AD-A166229] p 717 N86-30724
**HYPERSONIC AIRCRAFT**
Launching the aerospace plane p 686 A86-44442
**HYPERSONIC FLIGHT**
Calculation of the explosion of a rapidly flying body
p 738 A86-45344
**HYPERSONIC FLOW**
A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds
p 687 A86-43485
Unified supersonic/hypersonic similitude for oscillating wedges and plane ogives p 689 A86-44880
**HYPERSONIC SHOCK**
Hypersonic viscous shock layer on a surface with an abrupt variation of catalytic activity p 737 A86-43994

## I

**ICE FORMATION**
F-14A inlet icing p 709 A86-44937
**IGNITION**
Investigation of the ignition characteristics of hydrogen/air mixtures in the case of combustion induced by oblique shocks p 732 A86-45185
**IMAGE ANALYSIS**
A fast shape descriptor p 748 A86-46377
Problems of the visual display in flight simulation
p 731 A86-46719
**IMAGE PROCESSING**
Applications of artificial intelligence II; Proceedings of the Meeting, Arlington, VA, April 9-11, 1985
[SPIE-548] p 748 A86-46706
**IMAGE RESOLUTION**
Problems of the visual display in flight simulation
p 731 A86-46719
**IMPACT DAMAGE**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
**IMPACT LOADS**
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] p 701 N86-30702
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] p 716 N86-30721
**IMPACT STRENGTH**
Crashworthiness of airframes
[AGARD-R-737] p 702 N86-30709
**IMPACT TESTS**
Propeller FOD qualification using modal analysis, artificial birds, and a static impact facility
p 731 A86-47127
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] p 700 N86-29795
Aircraft transparency testing: Artificial birds
[AD-A166832] p 701 N86-30704
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] p 716 N86-30721
**IN-FLIGHT MONITORING**
British experimental aircraft program providing insight into new technology p 710 A86-45064
Development of in-flight thrust measurement procedures for an afterburning turbofan engine
[AIAA PAPER 85-1405] p 720 A86-45375
Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459
**INCOMPRESSIBLE FLOW**
On slender vortices p 689 A86-44810
Theoretical flutter investigations on a plane cascade in incompressible flow --- axial flow compressors and turbines p 727 N86-30635
**INCONEL (TRADEMARK)**
Ultrasonic direct backscattering technique for material surface inspection p 740 A86-47133
**INERTIAL NAVIGATION**
Identification and estimation of the random error models for inertial accelerometer and baro-altimeter
p 717 A86-43481
An inertial navigation system with single-axis stabilization p 702 A86-43484
Gravity-induced errors in airborne inertial navigation
p 703 A86-46457
**INFINITE SPAN WINGS**
Hypersonic viscous shock layer on a surface with an abrupt variation of catalytic activity p 737 A86-43994
**INFLATING**
Automatic Inflation Modulation (A.I.M.) parachute up-date p 698 A86-44781
**INFRARED DETECTORS**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728
**INFRARED TELESCOPES**
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] p 758 N86-31357
**INGESTION (ENGINES)**
Rotor noise due to atmospheric turbulence ingestion. II Aeroacoustic results
[AIAA PAPER 86-1903] p 750 A86-45404
**INLET FLOW**
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 697 N86-30697
PAN AIR application to the F-106B
[NASA-CR-178165] p 698 N86-30698
**INSPECTION**
Continuing structural integrity program for transport aircraft p 736 A86-43789
**INSTALLING**
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] p 704 N86-29806
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] p 705 N86-29807
**INSTRUMENT ERRORS**
Identification and estimation of the random error models for inertial accelerometer and baro-altimeter
p 717 A86-43481
**INSTRUMENT FLIGHT RULES**
The concept of almost parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] p 704 N86-29804
**INSTRUMENT LANDING SYSTEMS**
ILS goal - Automatic landings, safety
p 703 A86-46142
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] p 704 N86-29802
**INTAKE SYSTEMS**
Experimental study of flight effect on fan noise. I - A study of inflow control device for simulating in-flight fan noise in static test p 721 A86-46024
**INTERACTIONAL AERODYNAMICS**
Measurements of fluctuations of surface heat transfer rate in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43512
On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803
An experimental and theoretical investigation of the propagation of sound waves through a turbulent boundary layer
[AIAA PAPER 86-1968] p 753 A86-45451
Mid-field and far-field calculations of Blade-Vortex Interactions
[AIAA PAPER 86-1854] p 753 A86-45476
Concepts for reduction of blade-vortex interaction noise
[AIAA PAPER 86-1855] p 753 A86-45477
Surface pressure measurement during low speed two-dimensional blade-vortex interaction
[AIAA PAPER 86-1856] p 753 A86-45478
Features of discrete tones generated by jet flows over Coanda surfaces
[AIAA PAPER 86-1865] p 691 A86-45485
Rotor-strut interaction noise of a model fan
[AIAA PAPER 86-1871] p 755 A86-45491
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492
Influence of airfoil camber on convected gust interaction noise
[AIAA PAPER 86-1873] p 755 A86-45493
Viscous-inviscid interaction solvers and computation of highly separated flows
[ONERA, TP NO. 1986-4] p 691 A86-46152
Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method
[ONERA, TP NO. 1986-29] p 692 A86-46171
Incremental and iterative methods for solving fluid/structure interaction problems p 740 A86-47011
**INTERCEPTION**
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764
**INTERFEROMETERS**
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] p 701 N86-30705
**INVESTIGATION**
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[AIAA PAPER 86-1966] p 711 A86-45419
**INVISCID FLOW**
Viscous-inviscid interaction solvers and computation of highly separated flows
[ONERA, TP NO. 1986-4] p 691 A86-46152
Three-dimensional inviscid flow in mixers. II - Analysis of turbofan forced mixers p 692 A86-46316
Numerical calculations of inviscid transonic flows over wings p 692 A86-46415
**IONIZING RADIATION**
Cosmic-ray dose characteristics on the flight paths of high-altitude aircraft p 758 A86-43672
**ITERATIVE SOLUTION**
An iterative method for statically indeterminate structures of flight vehicle p 738 A86-45059
Incremental and iterative methods for solving fluid/structure interaction problems p 740 A86-47011

## J

**JAMMING**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908
**JET AIRCRAFT**
Residual strength characterization of jet transport structures p 707 A86-43795
Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764

READEX FICHE best copy available

**JET AIRCRAFT NOISE**
High speed flight effects on shock associated noise
[AIAA PAPER 86-1944] p 751 A86-45431
Shock noise from supersonic jets in simulated flight to Mach 0.4
[AIAA PAPER 86-1945] p 752 A86-45432
Aeroacoustics of contoured plug-nozzle supersonic jet flows
[AIAA PAPER 86-1946] p 752 A86-45433
On the screech tones of supersonic rectangular jets
[AIAA PAPER 86-1866] p 754 A86-45486
The noise emitted by turbulent jets in close proximity to solid surfaces
[AIAA PAPER 86-1869] p 755 A86-45489
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] p 756 N86-30470
**JET ENGINE FUELS**
Proceedings of Fuel Safety Workshop
[DOT/FAA/PM-86/13] p 733 N86-30007
Antimisting fuel technology for transport category aircraft p 733 N86-30008
AMK full-scale transport aircraft validation phase summary p 733 N86-30009
Post Controlled Impact Demonstration (CID) analysis p 733 N86-30010
UK work on safety fuels p 733 N86-30012
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013
Continuous inline blending of antimisting kerosene p 734 N86-30015
Olefin polymers as jet fuel antimist additives p 734 N86-30016
AMK: Still viable? p 734 N86-30017
Safety fuels-specifications and progress p 734 N86-30018
Amine-CO2 adducts as aviation fuel gelling agents p 701 N86-30020
GTA/BASF antimisting fuel research p 734 N86-30021
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] p 701 N86-30022
Antimisting kerosene: Evaluation of improved FM-9 additive
[DOT/FAA/CT-85-4] p 734 N86-30024
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] p 735 N86-30833
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454
**JET FLAPS**
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] p 716 N86-30722
**JET FLOW**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782
**JET IMPINGEMENT**
The pressure field generated by jet-jet impingement
[AIAA PAPER 86-1951] p 739 A86-45437
**JET MIXING FLOW**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782
**JET PROPULSION**
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454
**JETTISONING**
Store separation flight testing
[AGARD-AG-300-VOL-5] p 717 N86-30727

## K

**KALMAN FILTERS**
Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505
The design of multirate digital control systems
[NASA-CR-177126] p 726 N86-29863
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 749 N86-31265
**KEROSENE**
Full-Scale Transport Controlled Impact Demonstration Program photographic/video coverage
[DOT/FAA/CT-85/35] p 700 N86-29795
Antimisting fuel technology for transport category aircraft p 733 N86-30008
AMK full-scale transport aircraft validation phase summary p 733 N86-30009
Post Controlled Impact Demonstration (CID) analysis p 733 N86-30010
UK work on safety fuels p 733 N86-30012
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013
Continuous inline blending of antimisting kerosene p 734 N86-30015
AMK: Still viable? p 734 N86-30017
GTA/BASF antimisting fuel research p 734 N86-30021
Antimisting kerosene: Evaluation of improved FM-9 additive
[DOT/FAA/CT-85-4] p 734 N86-30024
Antimisting fuel research and development for commercial aircraft
[FAA/CT-86/7] p 735 N86-30883

## L

**LAMINAR BOUNDARY LAYER**
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] p 694 N86-29778
**LAMINAR FLOW**
Numerical solution of the supersonic laminar flow over a two-dimensional compression corner using an implicit approach p 690 A86-45054
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] p 693 N86-29772
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] p 722 N86-30731
**LAMINATES**
Response of symmetric rectangular composite laminates with nonlinear damping subjected to acoustic loading
[AIAA PAPER 86-1933] p 738 A86-45422
The vibration and stability of symmetrically-laminated composite rectangular plates subjected to in-plane stresses p 739 A86-45694
**LANDING GEAR**
Landing gear test facilities examined p 730 A86-44458
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233
Simulation of aircraft taxi testing on the AGILE shaker test facility p 731 N86-30663
**LANDING SPEED**
Ground resonance of a helicopter during the take-off and landing run p 712 A86-45749
**LARGE SCALE INTEGRATION**
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] p 705 N86-29807
**LASER GYROSCOPES**
Advanced laser based inertial instrument development
[AD-A166307] p 742 N86-30128
**LATERAL CONTROL**
Design and research of aircraft parameter-adaptive lateral command augmentation systems p 723 A86-43498
Tailoring methodology for aeroelastic stability and lateral control enhancement p 729 N86-30657
**LEADING EDGES**
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] p 693 N86-29772
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] p 714 N86-29810
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] p 714 N86-29813
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] p 742 N86-30094
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
PAN AIR application to the F-106B
[NASA-CR-178165] p 698 N86-30698
**LIFE (DURABILITY)**
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 736 A86-45256
Superalloy component durability enhancements p 739 A86-46562
**LIFT**
Far-field boundary conditions for transonic lifting solutions to the Euler equations p 689 A86-44855
Lifting-line solution for a symmetrical thin wing in ground effect p 689 A86-44874
Integration of singular functions associated with lifting surface theory p 689 A86-44875
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] p 695 N86-29786
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] p 745 N86-30899
**LIFT AUGMENTATION**
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] p 742 N86-30094
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
**LIFT DEVICES**
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 696 N86-30634
**LIFTING BODIES**
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 696 N86-30634
**LIGHT AIRCRAFT**
Comparison of modal analysis methods on a light aircraft p 730 A86-44933
Flight testing the Voyager - A non-stop, unrefueled, around-the-world aircraft p 710 A86-44948
Statistical analysis of the influence of service parameters on the aeroacoustic effects p 712 A86-45750
**LIGHTNING**
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] p 701 N86-30705
**LIGHTNING SUPPRESSION**
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] p 702 N86-30708
**LINEAR SYSTEMS**
The singular-G method for unstable non-minimum-phase plants p 747 A86-45736
Introduction to robust multivariable control
[AD-A165891] p 727 N86-29869
Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 748 N86-31265
**LININGS**
Cooling techniques for turbojet pre-heater channels p 741 N86-29847
**LINKAGES**
Safety recommendation
[NTSB-A-86-22] p 699 N86-29790
**LIQUID CRYSTALS**
Liquid-crystal goggles permit visual simulations of restricted visibility p 718 A86-46150
**LIQUID HYDROGEN**
Liquid hydrogen fueled passenger aircraft
[AD-A166229] p 717 N86-30724
**LISP (PROGRAMMING LANGUAGE)**
Smart Built-In-Test (BIT) p 747 A86-43689
**LOADS (FORCES)**
Determining component loads and stresses with improved system modeling techniques p 740 A86-47122
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233
**LOGIC PROGRAMMING**
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718
**LOGISTICS MANAGEMENT**
An example of integrated logistic support applied also to production testing --- aircraft industry p 744 N86-30896
**LONGITUDINAL CONTROL**
On a method for pilot dynamics identification reflecting feedback structures p 747 A86-43511
**LONGITUDINAL STABILITY**
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176099] p 729 N86-30736
**LOW ALTITUDE**
The dynamics of limiting helicopter maneuvers at a very low altitude p 724 A86-45748
**LOW ASPECT RATIO**
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins p 741 N86-29827
**LOW SPEED**
Surface pressure measurement during low speed two-dimensional blade-vortex interaction
[AIAA PAPER 86-1856] p 753 A86-45478

**LOW TEMPERATURE**
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] p 701 N86-30022
**LOW VISIBILITY**
Liquid-crystal goggles permit visual simulations of restricted visibility p 718 A86-46150
**LUBRICANT TESTS**
Carbon residue studies with a microcarbon residue tester
[ASLE PREPRINT 86-AM-7A-1] p 732 A86-45395
**LUBRICATION**
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454

## M

**MACH NUMBER**
Coherent large-scale structures in high Reynolds number supersonic jet of Mach number 1.4
[AIAA PAPER 86-1941] p 691 A86-45428
**MAINTENANCE**
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] p 704 N86-29806
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] p 705 N86-30715
**MALFUNCTIONS**
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718
**MAN MACHINE SYSTEMS**
Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] p 705 N86-30714
**MAPS**
Airborne navigation remote map reader evaluation
[AD-A166976] p 719 N86-30729
**MARINE ENVIRONMENTS**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728
**MATERIALS TESTS**
Durability and damage tolerance in aircraft design; Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 p 706 A86-43776
**MATHEMATICAL MODELS**
Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] p 693 N86-29770
Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] p 694 N86-29773
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801
Optimal landing of a helicopter in autorotation
[NASA-CR-177082] p 714 N86-29809
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] p 696 N86-30691
The integrated manual and atuomatic control of complex flight systems
[NASA-CR-176940] p 729 N86-30737
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30836
**MATRICES (MATHEMATICS)**
An adaptive flight control system design for CCV with an unknown interactor matrix p 723 A86-43536
**MATRIX METHODS**
Static aeroelastic analysis using aircraft vibration modes p 743 N86-30641
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing p 743 N86-30669
**METAL FATIGUE**
A simple crack closure model for predicting fatigue crack growth under flight simulation loading
p 737 A86-43796
National Transportation Safety Board safety recommendation
[NTSB-4357/1] p 699 N86-29792
**METALS**
The certification of airframes and components in metals and composites p 737 A86-43796
**METEOROLOGICAL FLIGHT**
A system for introducing mutual corrections into the airborne temperature and air-speed meters
p 738 A86-45208
The accuracy of air-temperature and flight-altitude measurements aboard meteorological aircraft
p 718 A86-45209
**METEOROLOGICAL INSTRUMENTS**
An upward looking airborne millimeter wave radiometer for atmospheric water vapor sounding and rain detection
p 718 A86-46676
**METEOROLOGICAL RADAR**
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] p 702 N86-30707
**METEOROLOGICAL SERVICES**
Forecasting for civil aviation. II p 746 A86-44380
LLWAS - An integral part of the U.S. wind-shear safety programme p 746 A86-46138
**MICROBURSTS**
LLWAS - An integral part of the U.S. wind-shear safety programme p 746 A86-46138
**MICROWAVE LANDING SYSTEMS**
DME/P - A necessary MLS component for the future
p 703 A86-46140
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] p 704 N86-29802
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] p 704 N86-29804
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] p 704 N86-29805
Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP)
[AD-A166916] p 705 N86-30715
**MICROWAVE RADIOMETERS**
An upward looking airborne millimeter wave radiometer for atmospheric water vapor sounding and rain detection
p 718 A86-46676
**MILITARY AIR FACILITIES**
A graphic terminal for air traffic control of Canadian military airports p 703 A86-44399
**MILITARY AIRCRAFT**
Damage tolerance - USAF experience
p 736 A86-43784
Generic integrated maintenance diagnostics
p 685 A86-44422
DOD overhauls maintenance p 758 A86-45703
Decision aiding for tactical aircraft
p 718 A86-46715
Piloting of unmanned air vehicles p 726 A86-46716
**MILITARY HELICOPTERS**
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
Northrop's surrogate trainer --- simulating AH-64A helicopter p 709 A86-44941
Aerobatic testing of the BK-117 helicopter
p 710 A86-44950
LHX targets dollars as well as bogeys
p 686 A86-45704
Soviet attack helicopters p 712 A86-46005
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] p 714 N86-29811
The black box. Silence is silver speech is golden
[ESA-86-97394] p 702 N86-30706
**MILITARY TECHNOLOGY**
New technologies offer quantum leap in future fighter capabilities p 686 A86-45063
**MISSILE CONTROL**
Comparison of angular and metric guidance laws for tactical missiles p 726 A86-46469
**MISSILES**
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454
**MISSION ADAPTIVE WINGS**
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-88265] p 714 N86-29813
**MISSION PLANNING**
Decision aiding for tactical aircraft
p 718 A86-46715
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764
**MIXERS**
Three-dimensional inviscid flow in mixers. II - Analysis of turbofan forced mixers p 692 A86-46316
**MIXING**
Continuous inline blending of antimisting kerosene
p 734 N86-30015
**MODAL RESPONSE**
Comparison of modal analysis methods on a light aircraft p 730 A86-44933
Structural modification by modal correction
p 738 A86-44934
New modal identification methods applied to aeronautical structures
[ONERA, TP NO. 1986-35] p 713 A86-46177
An intelligent amplifier and its application to modal testing --- for inflight aircraft testing p 719 A86-47106
Determining component loads and stresses with improved system modeling techniques
p 740 A86-47122
Propeller FOD qualification using modal analysis, artificial birds, and a static impact facility
p 731 A86-47127
Static aeroelastic analysis using aircraft vibration modes p 743 N86-30641
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique
p 716 N86-30678
Modified US Army U-8F ground vibration test
[NASA-TM-86741] p 717 N86-30723
**MONOPOLE ANTENNAS**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908
**MRCA AIRCRAFT**
Tornado high speed terrain following testing in mountainous terrain and bad weather
p 710 A86-44945
**MULTIPROCESSING (COMPUTERS)**
Remarks on the development of a multiblock three-dimensional Euler code for out of core and multiprocessor calculations p 748 A86-46791
**MULTISENSOR APPLICATIONS**
Fiber optic sensors for flexure measurement of aircraft structures p 739 A86-46135
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728
**MULTIVARIATE STATISTICAL ANALYSIS**
Introduction to robust multivariable control
[AD-A165891] p 727 N86-29869

## N

**NAP-OF-THE-EARTH NAVIGATION**
Tornado high speed terrain following testing in mountainous terrain and bad weather
p 710 A86-44945
**NASA PROGRAMS**
Advanced turboprop aircraft noise annoyance - A review of recent NASA research
[AIAA PAPER 86-1959] p 752 A86-45444
**NAVIER-STOKES EQUATION**
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation
[NASA-TM-88248] p 692 N86-29765
Pseudo-time algorithms for the Navier-Stokes equations
[NASA-CR-178127] p 694 N86-29776
Navier-Stokes computations for circulation controlled airfoils
[AIAA-85-1587] p 744 N86-30995
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] p 745 N86-30996
**NAVIGATION**
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] p 704 N86-29806
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] p 705 N86-29807
**NAVIGATION AIDS**
VLF radio navigation systems --- Russian book
p 703 A86-44279
Airborne navigation remote map reader evaluation
[AD-A166976] p 719 N86-30729
**NAVIGATION INSTRUMENTS**
Flight testing of the navigation and flight control complexes of aircraft and helicopters --- Russian book
p 708 A86-44283
Simulation of the algorithms of a navigation computer
p 748 A86-46369

Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] p 705 N86-30711

**NEAR FIELDS**

The near and far acoustic fields of broadband shock associated noise
[AIAA PAPER 86-1943] p 751 A86-45430

Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] p 756 N86-30469

**NICKEL ALLOYS**

Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838

**NITROGEN**

The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821

**NOISE (SOUND)**

A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] p 744 N86-30907

**NOISE GENERATORS**

Experimental results of the noise radiation of propellers in non-uniform flows
[AIAA PAPER 86-1928] p 751 A86-45419

**NOISE INTENSITY**

Pusher propeller noise directivity and trends
[AIAA PAPER 86-1929] p 751 A86-45420

**NOISE MEASUREMENT**

Advanced turboprop aircraft noise annoyance - A review of recent NASA research
[AIAA PAPER 86-1959] p 752 A86-45444

Aircraft noise measurement - Alternatives to the standard 1-2 metres microphone height
[AIAA PAPER 86-1960] p 752 A86-45445

A study of the rotor/rotor interaction tones from a contra-rotating propeller driven aircraft
[AIAA PAPER 86-1894] p 756 A86-45505

Effect of a wind tunnel on the acoustic field from various aeroacoustic sources
[AIAA PAPER 86-1897] p 756 A86-45507

Investigation of the aerodynamic performance and noise characteristics of a 1/5th scale model of the Dowty Rotol R212 propeller
[RAE-TM-AERO-1983] p 756 N86-30468

A new version of the helicopter aural detection program, ICHIN
[NASA-TM-87745] p 756 N86-30471

**NOISE PREDICTION (AIRCRAFT)**

Noise control characteristics of synchrophasing. I Analytical investigation --- of turboprop aircraft noise
p 708 A86-44853

Rotor noise due to atmospheric turbulence ingestion. II Aeroacoustic results
[AIAA PAPER 86-1903] p 750 A86-45404

Application of the Baseline Rotonet system to the prediction of helicopter tone noise
[AIAA PAPER 86-1904] p 750 A86-45405

Cabin noise characteristics of a small propeller powered aircraft
[AIAA PAPER 86-1906] p 710 A86-45407

Aeroacoustics of contoured plug-nozzle supersonic jet flows
[AIAA PAPER 86-1946] p 752 A86-45433

Broadband noise - Its prediction and likely importance for advanced propfans
[AIAA PAPER 86-1963] p 753 A86-45447

Broadband propeller noise prediction in the plane of the rotor
[AIAA PAPER 86-1964] p 753 A86-45448

Mid-field and far-field calculations of Blade-Vortex Interactions
[AIAA PAPER 86-1854] p 753 A86-45476

Prediction of structure-borne noise, based on the finite element method
[AIAA PAPER 86-1861] p 754 A86-45481

Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484

Influence of airfoil camber on convected gust interaction noise
[AIAA PAPER 86-1873] p 755 A86-45493

Theoretical prediction of single rotation propeller noise
[AIAA PAPER 86-1891] p 756 A86-45503

Statistical analysis of the influence of service parameters on the aeroacoustic effects p 712 A86-45750

Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] p 756 N86-30469

Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] p 757 N86-31338

**NOISE PROPAGATION**

Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401

Calculation of transonic rotor noise using a frequency domain formulation
[AIAA PAPER 86-1901] p 750 A86-45402

Cabin noise characteristics of a small propeller powered aircraft
[AIAA PAPER 86-1906] p 710 A86-45407

Propeller-induced structure-borne noise Laboratory-based test apparatus
[AIAA PAPER 86-1938] p 730 A86-45425

Features of discrete tones generated by jet flows over Coanda surfaces
[AIAA PAPER 86-1865] p 691 A86-45485

Rotor-strut interaction noise of a model fan
[AIAA PAPER 86-1871] p 755 A86-45491

A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] p 757 N86-31335

**NOISE REDUCTION**

Noise control characteristics of synchrophasing. I Analytical investigation --- of turboprop aircraft noise
p 708 A86-44853

Sound transmission through double panel constructions lined with clastic porous materials
[AIAA PAPER 86-1907] p 750 A86-45406

Pusher propeller noise directivity and trends
[AIAA PAPER 86-1929] p 751 A86-45420

Active control of propeller induced noise fields inside a flexible cylinder
[AIAA PAPER 86-1957] p 711 A86-45442

Concepts for reduction of blade-vortex interaction noise
[AIAA PAPER 86-1855] p 753 A86-45477

A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482

Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492

A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] p 757 N86-31335

**NOISE SPECTRA**

Counter-rotating propeller noise directivity and trends
[AIAA PAPER 86-1927] p 751 A86-45418

**NONISENTROPICITY**

An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] p 694 N86-29777

**NONLINEAR SYSTEMS**

A canonical form for nonlinear systems
[NASA-CR-176974] p 748 N86-30371

**NONUNIFORM FLOW**

Experimental results of the noise radiation of propellers in non-uniform flows
[AIAA PAPER 86-1928] p 751 A86-45419

**NOSE WHEELS**

Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233

**NOTCH TESTS**

Mode II fatigue crack growth specimen development
p 736 A86-43566

**NOZZLE GEOMETRY**

Aeroacoustics of contoured plug-nozzle supersonic jet flows
[AIAA PAPER 86-1946] p 752 A86-45433

Acoustic properties associated with rectangular geometry supersonic nozzles
[AIAA PAPER 86-1867] p 754 A86-45487

**NUCLEAR EXPLOSION EFFECT**

Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] p 702 N86-30708

**NUMERICAL ANALYSIS**

Calculation of transonic rotor noise using a frequency domain formulation
[AIAA PAPER 86-1901] p 750 A86-45402

**NUMERICAL CONTROL**

Expert systems for mechanical fault diagnosis
p 737 A86-43896

Digital control loading and motion - The final word? --- in flight simulation p 732 A86-46149

**NUMERICAL INTEGRATION**

Integration of singular functions associated with lifting surface theory p 6[illegible]9 A[illegible]-44875

**NUMERICAL STABILITY**

The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem p 690 A86-45189

## O

**OBLIQUE SHOCK WAVES**

Measurements of fluctuations of surface heat transfer rate in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43512

Fluctuations of wall pressure in the interacting region of oblique shock wave and turbulent boundary layer
p 688 A86-43514

Investigation of the ignition characteristics of hydrogen/air mixtures in the case of combustion induced by oblique shocks p 732 A86-45185

**OBLIQUE WINGS**

Model-following control for an oblique-wing aircraft
[NASA-TM-88269] p 726 N86-29867

Eigensystem synthesis for active flutter suppression on an oblique-wing aircraft
[NASA-TM-88275] p 727 N86-29868

**OGIVES**

Unified superso[illegible]personic similitude for oscillating wedges and plane [illegible] p 689 A86-44880

**OMEGA NAVIGATION SYSTEM**

VLF radio navigation systems --- Russian book
p 703 A86-44279

Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] p 705 N86-30711

**ONBOARD DATA PROCESSING**

Decision aiding for tactical aircraft
p 718 A86-46715

**OPERATING COSTS**

LHX targets dollars as wall as bogeys
p 686 A86-45704

**OPTICAL HETERODYNING**

Sensitivity, noise and optical crosstalk in heterodyne acousto-optical signal processors p 740 A86-46701

**OPTICAL MEASURING INSTRUMENTS**

Fiber optic sensors for flexure measurement of aircraft structures p 739 A86-46135

Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] p 756 N86-31357

**OPTIMAL CONTROL**

An optimal parameter estimation method compatible with stable parameter prediction in time domain
p 746 A86-43482

Use of block-pulse functions in the optimal control of deterministic systems p 747 A86-45726

Comparison of angular and metric guidance laws for tactical missiles p 726 A86-46469

Optimal landing of a helicopter in autorotation
[NASA-CR-177082] p 714 N86-29809

The integrated manual and atuomatic control of complex flight systems
[NASA-CR-176940] p 729 N86-30737

**OPTIMIZATION**

Computer aided engineering in structural design and optimization p 736 A86-43759

The optimization of seaplanes - New chances and requirements regarding flying boats p 707 A86-43930

Optimizing the NOTAR design p 708 A86-44460

Optimization of stiffened panels under compression
p 739 A86-45762

Mechanical design of gas turbine blading in cast superalloys p 721 A86-45819

Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques p 728 N86-30647

The application of practical optimization techniques in the preliminary structural design of a forward-swept wing
p 715 N86-30654

Structural optimization programs and methods --- aircraft weight reduction p 715 N86-30655

Variation of anisotropic behavior in structural optimization --- aircraft composite structures
p 715 N86-30656

Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741

**OSCILLATING FLOW**

Unified supersonic/hypersonic similitude for oscillating wedges and plane ogives p 689 A86-44880

Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings
p 695 N86-30629

**OXYGEN**

Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] p 743 N86-30890

## P

**PANEL FLUTTER**

Recent results on the weight minimization of panels with a flutter speed constraint p 715 N86-30660

**PANEL METHOD (FLUID DYNAMICS)**

Vortex sheet modeling with higher order curved panels [NASA-CR-176971] p 693 N86-29770

Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings p 695 N86-30629

**PANELS**

Sound transmission through double panel constructions lined with elastic porous materials [AIAA PAPER 86-1907] p 750 A86-45408

Optimization of stiffened panels under compression p 739 A86-45762

Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel [NASA-TM-89011] p 715 N86-29815

Assessing the effects of delaminations on the postbuckling strength of CRFP panels --- aircraft structures p 743 N86-30781

**PARACHUTES**

Automatic Inflation Modulation (A.I.M.) parachute up-date p 698 A86-44781

**PARALLELEPIPEDS**

Rectangular parallelepiped coding - A volumetric representation of three-dimensional objects p 747 A86-45473

**PARAMETER IDENTIFICATION**

Identification and estimation of the random error models for inertial accelerometer and baro-altimeter p 717 A86-43481

An optimal parameter estimation method compatible with stable parameter prediction in time domain p 746 A86-43482

On a method for pilot dynamics identification reflecting feedback structures p 747 A86-43511

Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461

Identification of aeroelastic phenomenon employing bispectral analysis techniques p 740 A86-47124

**PARTIAL DIFFERENTIAL EQUATIONS**

Flap-lag-torsional dynamics of helicopter rotor blades in forward flight [NASA-CR-176976] p 714 N86-29810

**PASSENGER AIRCRAFT**

Corporate flying, Italian style p 712 A86-45753

Avanti to fly soon p 713 A86-46405

Task Force report on emergency evacuation of transport airplanes, volume 1 [DOT/FAA/VS-86/1.1] p 699 N86-29793

**PATTERN RECOGNITION**

A fast shape descriptor p 748 A86-46377

**PERFORATING**

Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel [NASA-TM-89011] p 715 N86-29815

**PERFORMANCE PREDICTION**

Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families [NASA-CR-176883] p 697 N86-30693

Aerodynamics of seeing on large transport aircraft [NASA-CR-177035] p 758 N86-31357

**PERFORMANCE TESTS**

Hardware performance analysis of the basic narrow Microwave Landing System (MLS) at Washington National Airport (DCA) in the Service Test and Evaluation Program (STEP) [AD-A166916] p 705 N86-30715

An example of integrated logistic support applied also to production testing --- aircraft industry p 744 N86-30898

**PILOT ERROR**

Investigation of hazards of helicopter operations and root causes of helicopter accidents [FAA/PM-86/28] p 700 N86-29796

**PILOT INDUCED OSCILLATION**

On a method for pilot dynamics identification reflecting feedback structures p 747 A86-43511

**PILOT PERFORMANCE**

Crew situational awareness drives avionics developments p 718 A86-45067

Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459

Feasibility study for ergonomic analysis and design of future helicopter cockpit systems [NASA-CR-176942] p 714 N86-29811

Improving the interpretability of an aircraft attitude indicator [AD-A166329] p 719 N86-29817

A survey of handling qualities criteria and their applications to high performance aircraft [NASA-CR-179654] p 729 N86-30738

**PILOT TRAINING**

Flight simulation p 730 A86-45137

Liquid-crystal goggles permit visual simulations of restricted visibility p 718 A86-46150

**PILOTLESS AIRCRAFT**

The SKYEYE RPV - An NDI solution to today's unmanned aerial vehicle requirements p 712 A86-46134

**PILOTS (PERSONNEL)**

Development of an algorithm to model an aircraft equipped with a generic CDTI display [NASA-TM-87732] p 748 N86-30349

**PIPE FLOW**

Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013

**PITCH**

On the screech tones of supersonic rectangular jets [AIAA PAPER 86-1866] p 754 A86-45486

**PITCH (INCLINATION)**

Unfolding of degenerate Hopf bifurcation for supersonic flow past a pitching wedge p 725 A86-46456

**PITOT TUBES**

Correlation of transonic-cone preston-tube data and skin friction [NASA-CR-176902] p 693 N86-29771

**PLANE STRAIN**

The vibration and stability of symmetrically-laminated composite rectangular plates subjected to in-plane stresses p 739 A86-45694

**PLASTIC AIRCRAFT STRUCTURES**

CFRP-wing for the Alpha jet p 686 A86-46199

**POLICIES**

Introduction to the recent developments of China's civil aviation [AD-A166154] p 687 N86-29763

**POROSITY**

Numerical studies of porous airfoils in transonic flow [NASA-CR-179655] p 697 N86-30696

**POROUS BOUNDARY LAYER CONTROL**

Numerical studies of porous airfoils in transonic flow [NASA-CR-179655] p 697 N86-30696

**POROUS MATERIALS**

Sound transmission through double panel constructions lined with elastic porous materials [AIAA PAPER 86-1907] p 750 A86-45408

**POSITION (LOCATION)**

Auditory helicopter detection and localization; a literature review focusing on search for helicopters [FOA-C-50033-H2] p 757 N86-30474

Advisory Circular: Auxiliary fuel system installations [FAA/AC-25-8] p 716 N86-30719

Design, development and integrate/install an airborne remote instrumentation system (AIREYE) [AD-A166755] p 719 N86-30728

**POTENTIAL FLOW**

Calculation of the potential flow around wing profiles with the aid of a continuously differentiable vortex distribution p 689 A86-44979

Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings p 695 N86-30629

**POTENTIAL GRADIENTS**

An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 695 N86-30633

**POTENTIAL THEORY**

Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 695 N86-30631

**POWDER METALLURGY**

The need for rapidly solidified powder metallurgy aluminum alloys for aerospace applications p 732 A86-46827

Developments in premium high-strength powder metallurgy alloys by Kaiser Aluminum p 733 A86-46842

**PRECISION**

Precision casting of aero gas turbine components p 739 A86-45816

**PREDICTION ANALYSIS TECHNIQUES**

Experimental and theoretical study of propeller spinner/shank interference [NASA-CR-176954] p 694 N86-29773

A survey of handling qualities criteria and their applications to high performance aircraft [NASA-CR-179654] p 729 N86-30738

**PREDICTIONS**

The physical and empirical basis for a specific clear-air turbulence risk index [NASA-CR-3971] p 746 N86-30285

Sonic-boom research: Selected bibliography with annotation [NASA-TM-87685] p 756 N86-30470

Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles [NASA-TM-87757] p 697 N86-30694

Gust load prediction and alleviation on a fighter aircraft [AGARD-R-728] p 729 N86-30741

**PRESSURE DISTRIBUTION**

Pressure loading on curved leading edge wings in supersonic flow p 689 A86-44890

Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow p 695 N86-30632

An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 695 N86-30633

Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 696 N86-30639

**PRESSURE DRAG**

The reverse-flow theorem for transonic flow p 688 A86-44802

**PRESSURE GRADIENTS**

Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles [NASA-TM-87757] p 697 N86-30694

**PRESSURE MEASUREMENT**

Surface pressure measurement during low speed two-dimensional blade-vortex interaction [AIAA PAPER 86-1856] p 753 A86-45478

Correlation of transonic-cone preston-tube data and skin friction [NASA-CR-176902] p 693 N86-29771

Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench [ONERA-RT-95/7108-RY-054-R] p 743 N86-30219

Experimental and numerical results for a generic axisymmetric single-engine afterbody with tails at transonic speeds [NASA-TM-87755] p 697 N86-30695

**PRESSURE OSCILLATIONS**

Fluctuations of wall pressure in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43514

The pressure field generated by jet-jet impingement [AIAA PAPER 86-1951] p 739 A86-45437

**PRESSURE REDUCTION**

Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins p 741 N86-29827

**PRESSURE SENSORS**

Computations and turbulent flow modeling in support of helicopter rotor technology [NASA-CR-177095] p 742 N86-30090

**PROBLEM SOLVING**

Development of a numerical procedure to map a general 3-d body onto a near-circle p 749 N86-31420

**PROCUREMENT MANAGEMENT**

The selection and acquisition of commercial aircraft fleets p 686 A86-44935

**PRODUCTION ENGINEERING**

An example of integrated logistic support applied also to production testing --- aircraft industry p 744 N86-30898

**PROP-FAN TECHNOLOGY**

Active minimisation of acoustic potential energy in harmonically excited cylindrical enclosed sound fields [AIAA PAPER 86-1958] p 752 A86-45443

Broadband noise - Its prediction and likely importance for advanced propfans [AIAA PAPER 86-1963] p 753 A86-45447

A comparison of the structureborne and airborne paths for propfan interior noise [AIAA PAPER 86-1863] p 711 A86-45483

Propeller noise caused by blade tip radial forces [AIAA PAPER 86-1892] p 721 A86-45504

**PROPELLER BLADES**

Propeller noise caused by blade tip radial forces [AIAA PAPER 86-1892] p 721 A86-45504

Propeller FOD qualification using modal analysis, artificial birds, and a static impact facility p 731 A86-47127

**PROPELLER DRIVE**

Structural influence of cabin floor on sound transmission into propeller aircraft - Analytical investigations [AIAA PAPER 86-1940] p 711 A86-45427

**PROPELLER EFFICIENCY**

An experimental investigation of reducing advanced turboprop cabin noise by wing shielding [AIAA PAPER 86-1966] p 711 A86-45449

Investigation of the aerodynamic performance and noise characteristics of a 1/5th scale model of the Dowty Rotol R212 propeller [RAE-TM-AERO-1983] p 756 N86-30468

Aerodynamic data banks for Clark-Y, NACA 4-digit and NACA 16-series airfoil families [NASA-CR-176883] p 697 N86-30693

**PROPELLERS**

Modelling of acoustic radiation problems associated with turbomachinery and rotating blades p 749 A86-44805

The effect on radiated noise of non-zero propeller rotational plane attitude
[AIAA PAPER 86-1926] p 750 A86-45417

Counter-rotating propeller noise directivity and trends
[AIAA PAPER 86-1927] p 751 A86-45418

Experimental results of the noise radiation of propellers in non-uniform flows
[AIAA PAPER 86-1928] p 751 A86-45419

Pusher propeller noise directivity and trends
[AIAA PAPER 86-1929] p 751 A86-45420

Propeller-induced structure-borne noise - Laboratory-based test apparatus
[AIAA PAPER 86-1938] p 730 A86-45425

Active control of propeller induced noise fields inside a flexible cylinder
[AIAA PAPER 86-1957] p 711 A86-45442

Broadband propeller noise prediction in the plane of the rotor
[AIAA PAPER 86-1964] p 753 A86-45448

Wing loads induced by a propeller wake
[AIAA PAPER 86-1967] p 711 A86-45450

Aerodynamics via acoustics - Application of acoustic formulas for aerodynamic calculations
[AIAA PAPER 86-1877] p 691 A86-45494

Theoretical prediction of single rotation propeller noise
[AIAA PAPER 86-1891] p 756 A86-45503

Statistical analysis of the influence of service parameters on the aeroacoustic effects p 712 A86-45750

Experimental and theoretical study of propeller spinner/shank interference
[NASA-CR-176954] p 694 N86-29773

Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] p 757 N86-31338

Directivity and trends of noise generated by a propeller in a wake
[NASA-TP-2609] p 757 N86-31341

**PROPORTIONAL CONTROL**

Controllability of redundant flight control system and pressure equalization of redundant servo actuators
p 723 A86-43497

**PROPULSION SYSTEM CONFIGURATIONS**

Propelling the aerospace plane p 720 A86-43910

Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] p 697 N86-30694

**PROTOTYPES**

The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764

High accuracy fuel flowmeter
[NASA-CR-174869] p 745 N86-31090

**PURSUIT TRACKING**

Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459

**PYLONS**

Flight test of a decoupler pylon for wing/store flutter suppression
[NASA-TM-87767] p 714 N86-29814

## Q

**QUALITY CONTROL**

Precision casting of aero gas turbine components
p 739 A86-45816

UK work on safety fuels p 733 N86-30012

## R

**RADAR**

Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A
[AD-A166815] p 704 N86-29806

Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A
[AD-A166816] p 705 N86-29807

**RADAR APPROACH CONTROL**

Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] p 702 N86-30707

**RADAR CROSS SECTIONS**

Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] p 744 N86-30931

**RADAR ECHOES**

Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL 4] p 744 N86-30931

**RADAR SIGNATURES**

Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] p 744 N86-30931

**RADAR TARGETS**

Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30726

**RADAR TRACKING**

A survey of multiple targets tracking technique
p 735 A86-43489

**RADIATION DOSAGE**

Cosmic-ray dose characteristics on the flight paths of high-altitude aircraft p 756 A86-43672

**RADIATION MEASUREMENT**

Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] p 723 N86-30735

**RADII**

Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908

**RADIO FREQUENCY INTERFERENCE**

A computer model to evaluate airborne receiver performance in interference environments
p 703 A86-43862

**RADIO NAVIGATION**

VLF radio navigation systems — Russian book
p 703 A86-44279

**RADIO RECEIVERS**

A computer model to evaluate airborne receiver performance in interference environments
p 703 A86-43862

**RAIN**

The effect of rain and contamination of the front surface on the in-flight behavior of aircraft during roll. II
p 688 A86-43938

An upward looking airborne millimeter wave radiometer for atmospheric water vapor sounding and rain detection
p 718 A86-46676

**RANDOM ERRORS**

Identification and estimation of the random error models for inertial accelerometer and baro-altimeter
p 717 A86-43481

**RANDOM VIBRATION**

Multi shaker modal testing using a modified transient random excitation p 740 A86-47107

**RAPID QUENCHING (METALLURGY)**

The need for rapidly solidified powder metallurgy aluminum alloys for aerospace applications
p 732 A86-46827

**REACTION KINETICS**

Improving the interpretability of an aircraft attitude indicator
[AD-A166329] p 719 N86-29817

**READERS**

Airborne navigation remote map reader evaluation
[AD-A166976] p 719 N86-30729

**REAL TIME OPERATION**

Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30726

**RECTANGULAR PANELS**

Predicted and measured strain response of rectangular panels due to acoustic loading
[AIAA PAPER 86-1931] p 751 A86-45421

**RECTANGULAR WINGS**

The wing tip vortex system in a starting flow
p 690 A86-45190

**REDUNDANT COMPONENTS**

Controllability of redundant flight control system and pressure equalization of redundant servo actuators
p 723 A86-43497

**REFRACTORY MATERIALS**

Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838

**REFUELING**

Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725

**REGENERATION (ENGINEERING)**

Heat exchangers in regenerative gas turbine cycles
p 741 N86-29857

**REGULATIONS**

Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] p 716 N86-30719

**REINFORCED PLATES**

Stability analysis of composite stiffened layer plates under compression p 735 A86-43495

The vibration and stability of symmetrically-laminated composite rectangular plates subjected to in-plane stresses p 739 A86-45694

**REMOTELY PILOTED VEHICLES**

The SKYEYE RPV - An NDI solution to today's unmanned aerial vehicle requirements
p 712 A86-46134

Piloting of unmanned air vehicles p 726 A86-46716

**REQUIREMENTS**

Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] p 705 N86-30714

**RESEARCH AIRCRAFT**

Modified US Army U-8F ground vibration test
[NASA-TM-86741] p 717 N86-30723

Geometerial description for a proposed aeroassist flight experiment vehicle
[NASA-TM-87714] p 749 N86-31237

**RESEARCH AND DEVELOPMENT**

Launching the aerospace plane p 686 A86-44442

World aerospace profile 1986 — Book
p 686 A86-44919

**RESEARCH MANAGEMENT**

Cryogenic wind tunnels for high Reynolds number testing
[NASA-TM-877[illegible]1] p 731 N86-29872

**RESIDUAL STRENGTH**

A rationale for the safe operation of an aircraft fleet having known cracks in primary structure
p 737 A86-43792

The influence of slow growth and net section yielding on the residual strength of stiffened structure
p 737 A86-43793

Residual strength characterization of jet transport structures p 707 A86-43795

Assessing the effects of delaminations on the postbuckling strength of CRFP panels — aircraft structures p 743 N86-30781

**RESIDUES**

Carbon residue studies with a microcarbon residue tester
[ASLE PREPRINT 86-AM-7A-1] p 732 A86-45395

**RETARDING**

Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] p 727 N86-29870

**REVERSED FLOW**

The reverse-flow theorem for transonic flow
p 688 A86-44802

**REYNOLDS NUMBER**

Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] p 693 N86-29771

**RHEOLOGY**

Antimisting fuel technology for transport category aircraft p 733 N86-30008

Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013

**RIGID ROTORS**

Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477

**RIGID STRUCTURES**

Numerical modelling of the dynamics of aerobatic manoeuvres p 724 A86-45144

**RISK**

The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] p 746 N86-30285

**ROBOTICS**

Applications of artificial intelligence II; Proceedings of the Meeting, Arlington, VA, April 9-11, 1985
[SPIE-548] p 748 A86-46706

**ROBOTS**

The design of multirate digital control systems
[NASA-CR-177126] p 726 N86-29863

**ROBUSTNESS (MATHEMATICS)**

Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] p 722 N86-30732

Control design for robust stability in linear regulators: Application to aerospace flight control
[NASA-CR-176858] p 749 N86-31265

**ROCKET ENGINES**

Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454

**ROCKET NOZZLES**

Vectored thrust digital flight control for crew escape, volume 1
[AD-A166580] p 700 N86-29798

**ROCKET PROPELLANTS**

Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454

**ROLL**
The effect of rain and contamination of the front surface on the in-flight behavior of aircraft during roll. II p 688 A86-43938
Preliminary design of low authority SAS. II — stability augmentation system p 724 A86-45058

**ROOT-MEAN-SQUARE ERRORS**
Improving the interpretability of an aircraft attitude indicator [AD-A166329] p 719 N86-29817

**ROTARY ENGINES**
Rotary grows up p 720 A86-44007

**ROTARY STABILITY**
Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477
Active suppression of compressor instabilities [AIAA PAPER 86-1914] p 690 A86-45410

**ROTARY WINGS**
Application of harmonic analysis method to research on rotor airloads p 706 A86-43490
Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505
On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803
Computation of rotor blade flows using the Euler equations p 689 A86-44891
Calculation of transonic rotor noise using a frequency domain formulation [AIAA PAPER 86-1901] p 750 A86-45402
Mid-field and far-field calculations of Blade-Vortex Interactions [AIAA PAPER 86-1854] p 753 A86-45476
Concepts for reduction of blade-vortex interaction noise [AIAA PAPER 86-1855] p 753 A86-45477
Surface pressure measurement during low speed two-dimensional blade-vortex interaction [AIAA PAPER 86-1856] p 753 A86-45478
Rotor noise due to atmospheric turbulence ingestion. I - Fluid mechanics [AIAA PAPER 86-1857] p 754 A86-45479
10 years of rotor flows studies at ONERA - State of the art and future studies [ONERA, TP NO. 1986-49] p 692 A86-46185
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity p 696 N86-30636
Structural dynamic aspects of rotor nodal isolation — helicopters p 715 N86-30665
Aeroelastic considerations for torsionally soft rotors [NASA-TM-87687] p 745 N86-31070

**ROTATING CYLINDERS**
Flows past a rotating circular cylinder at high Reynolds number p 688 A86-43533

**ROTATING ENVIRONMENTS**
The effect on radiated noise of non-zero propeller rotational plane attitude [AIAA PAPER 86-1926] p 750 A86-45417

**ROTOR AERODYNAMICS**
Application of harmonic analysis method to research on rotor airloads p 706 A86-43490
Computation of rotor blade flows using the Euler equations p 689 A86-44891
Rotor noise due to atmospheric turbulence ingestion. II Aeroacoustic results [AIAA PAPER 86-1903] p 750 A86-45404
Rotor noise due to atmospheric turbulence ingestion. I - Fluid mechanics [AIAA PAPER 86-1857] p 754 A86-45479
Rotor-strut interaction noise of a model fan [AIAA PAPER 86-1871] p 755 A86-45491
Aerodynamics via acoustics - Application of acoustic formulas for aerodynamic calculations [AIAA PAPER 86-1877] p 691 A86-45494
A study of the rotor/rotor interaction tones from a contra-rotating propeller driven aircraft [AIAA PAPER 86-1894] p 756 A86-45505
10 years of rotor flows studies at ONERA - State of the art and future studies [ONERA, TP NO. 1986-49] p 692 A86-46185
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download [NASA-CR-176970] p 683 N86-29769
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity p 696 N86-30636

**ROTOR BLADES**
National Transportation Safety Board safety recommendation [NTSB-4357/1] p 699 N86-29792

**ROTOR BLADES (TURBOMACHINERY)**
Modelling of acoustic radiation problems associated with turbomachinery and rotating blades p 749 A86-44805
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip [NASA-CR-177110] p 693 N86-29766
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight [NASA-CR-176976] p 714 N86-29810
Wake-passing in a turbine rotor cascade p 741 N86-29830
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
Preliminary instrumentation for aeroelastic tests at the compressor level — turbocompressor test bench [ONERA-RT-95/7108-RY-054-R] p 743 N86-30219

**ROTOR SPEED**
High speed rotor noise due to blade loading [AIAA PAPER 86-1902] p 750 A86-45403

**ROTOR SYSTEMS RESEARCH AIRCRAFT**
X-wing rotor systems test vehicle scheduled for flight in October p 707 A86-44001

**ROTORS**
Analytical investigation of rotor wake formation and geometry [NASA-CR-177032] p 693 N86-29768
Multi-variable control of the GE T700 engine using the LQG/LTR design methodology [NASA-CR-177080] p 721 N86-29819

**RUNWAYS**
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways [AD-A166485] p 704 N86-29804

## S

**SAFETY**
Operating and support hazard analysis for the self-contained navigation system LSI model 6216A, B and C group A [AD-A166815] p 704 N86-29806
Subsystem hazard analysis for the LSI models 6216A, B and C self-contained navigation sysgem group A [AD-A166816] p 705 N86-29807

**SAFETY FACTORS**
A rationale for the safe operation of an aircraft fleet having known cracks in primary structure p 737 A86-43792

**SAFETY MANAGEMENT**
The fire-hard airliner p 698 A86-44400

**SANDWICH STRUCTURES**
Stability analysis of composite stiffened layer plates under compression p 735 A86-43495
Buckling and initial post buckling analysis of composite panels under axial compression p 735 A86-43496

**SATELLITE COMMUNICATION**
Applications of satellite communications technologies to International Civil Aviation p 702 A86-43708

**SCALE MODELS**
Aircraft transparency testing: Artificial birds [AD-A166832] p 701 N86-30704

**SCANNING**
The SKYEYE RPV - An NDI solution to today's unmanned aerial vehicle requirements p 712 A86-46134
Design, development and integrate/install an airborne remote instrumentation system (AIREYE) [AD-A166755] p 719 N86-30728

**SCHLIEREN PHOTOGRAPHY**
Wake-passing in a turbine rotor cascade p 741 N86-29830

**SEAPLANES**
The optimization of seaplanes - New chances and requirements regarding flying boats p 707 A86-43930

**SEATS**
Seat experiment results of full-scale transport aircraft controlled impact demonstration [DOT/FAA/CT-85/25] p 701 N86-30702

**SELF ADAPTIVE CONTROL SYSTEMS**
Design and research of aircraft parameter-adaptive lateral command augmentation systems p 723 A86-43498

**SEPARATED FLOW**
Viscous-inviscid interaction solvers and computation of highly separated flows [ONERA, TP NO. 1986-4] p 691 A86-46152
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow p 695 N86-30632
Three-dimensional shock wave and turbulent boundary layer interactions [AD-A167086] p 745 N86-31010

**SEQUENTIAL CONTROL**
Vectored thrust digital flight control for crew escape, volume 2 [AD-A166506] p 700 N86-29799

**SERVICE LIFE**
National Transportation Safety Board safety recommendation [NTSB-4357/1] p 699 N86-29792
Advances in the study of the mechanical behavior of materials [AD-A164656] p 735 N86-30838

**SERVOCONTROL**
Controllability of redundant flight control system and pressure equalization of redundant servo actuators p 723 A86-43497

**SERVOMECHANISMS**
Improvement of servo systems for flight simulator p 706 A86-43487

**SHEAR FLOW**
The noise emitted by turbulent jets in close proximity to solid surfaces [AIAA PAPER 86-1869] p 755 A86-45489
Motion and interaction of decaying trailing vortices in spanwise shear wind [NASA-TP-2599] p 687 N86-29762

**SHEAR LAYERS**
Aerodynamics of seeing on large transport aircraft [NASA-CR-177035] p 758 N86-31357

**SHIELDING**
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding [AIAA PAPER 86-1966] p 711 A86-45449

**SHOCK LAYERS**
Hypersonic viscous shock layer on a surface with an abrupt variation of catalytic activity p 737 A86-43994

**SHOCK WAVE INTERACTION**
Numerical studies of porous airfoils in transonic flow [NASA-CR-179655] p 697 N86-30696
Three-dimensional shock wave and turbulent boundary layer interactions [AD-A167086] p 745 N86-31010

**SHOCK WAVE PROPAGATION**
Role of shocks in transonic/supersonic compressor rotor flutter p 720 A86-44872

**SHOCK WAVES**
The near and far acoustic fields of broadband shock associated noise [AIAA PAPER 86-1943] p 751 A86-45430
High speed flight effects on shock associated noise [AIAA PAPER 86-1944] p 751 A86-45431
Shock noise from supersonic jets in simulated flight to Mach 0.4 [AIAA PAPER 86-1945] p 752 A86-45432
An entropy correction method for unsteady full potential flows with strong shocks [NASA-TM-87769] p 694 N86-29777

**SIDE-LOOKING RADAR**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE) [AD-A166755] p 719 N86-30728

**SIGNAL PROCESSING**
A graphic terminal for air traffic control of Canadian military airports p 703 A86-44399
Sensitivity, noise and optical crosstalk in heterodyne acousto-optical signal processors p 740 A86-46701
Analogue signal conditioning for flight test instrumentation [AGARD-AG-160-VOL-17] p 719 N86-29816
The design of multirate digital control systems [NASA-CR-177126] p 726 N86-29863

**SILICON CARBIDES**
Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858

**SIMILARITY THEOREM**
Anisotropic wing aeroelastic theories with warping effects p 696 N86-30659

**SIMILITUDE LAW**
Unified supersonic/hypersonic similitude for oscillating wedges and plane ogives p 689 A86-44880

**SIMULATION**
Sonic-boom research: Selected bibliography with annotation [NASA-TM-8[illegible]] p 756 N86-30470

**SIMULATORS**
Arnold Engineering Development Center - Simulators encompass spectrum of aerospace environments p 730 A86-45673
Arnold Engineering Development Center - New facility to assess engine-airframe compatibility prior to first flight p 730 A86-45674
Technology research for strapdown inertial experiment and digital flight control and guidance [NASA-CR-176907] p 703 N86-29800

**SINE WAVES**
Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505

Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight
p 713 A86-46461

**SINGULAR INTEGRAL EQUATIONS**
Integration of singular functions associated with lifting surface theory
p 689 A86-44875

**SIZE DETERMINATION**
Rapid sizing method for airplanes
p 708 A86-44887

**SKEWNESS**
Model-following control for an oblique-wing aircraft
[NASA-TM-88269] p 726 N86-29867

**SKIN FRICTION**
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] p 693 N86-29771

**SLENDER WINGS**
The role of structural and aerodynamic damping on the aeroelastic behavior of wings
p 708 A86-44894

**SLURRIES**
Continuous inline blending of antimisting kerosene
p 734 N86-30015

**SOFTWARE ENGINEERING**
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718

**SOFTWARE TOOLS**
Requirements and recommendations for the development of theoretical codes and experimental facilities in the near future --- for aircraft design
[ONERA, TP NO. 1986-10] p 731 A86-46155

**SONIC BOOMS**
Sonic-boom research: Selected bibliography with annotation
[NASA-TM-87685] p 756 N86-30470

**SOUND FIELDS**
Mid-field and far-field calculations of Blade-Vortex Interactions
[AIAA PAPER 86-1854] p 753 A86-45476
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482
Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484
Effect of a wind tunnel on the acoustic field from various aeroacoustic sources
[AIAA PAPER 86-1897] p 756 A86-45507

**SOUND INTENSITY**
Investigation of the aerodynamic performance and noise characteristics of a 1/5th scale model of the Dowty Rotol R212 propeller
[RAE-TM-AERO-1983] p 756 N86-30468

**SOUND LOCALIZATION**
Auditory helicopter detection and localization; a literature review focusing on search for helicopters
[FOA-C-50033-H2] p 757 N86-30474

**SOUND TRANSMISSION**
Sound transmission through double panel constructions lined with elastic porous materials
[AIAA PAPER 86-1907] p 750 A86-45408
Propeller-induced structure-borne noise Laboratory-based test apparatus
[AIAA PAPER 86-1938] p 730 A86-45425
Effects of an internal floor on low frequency sound transmission into aircraft cabins - An experimental investigation
[AIAA PAPER 86-1939] p 711 A86-45426
Structural influence of cabin floor on sound transmission into propeller aircraft - Analytical investigations
[AIAA PAPER 86-1940] p 711 A86-45427

**SOUND WAVES**
Predicted and measured strain response of rectangular panels due to acoustic loading
[AIAA PAPER 86-1931] p 751 A86-45421
Response of symmetric rectangular composite laminates with nonlinear damping subjected to acoustic loading
[AIAA PAPER 86-1933] p 738 A86-45422
Active minimisation of acoustic potential energy in harmonically excited cylindrical enclosed sound fields
[AIAA PAPER 86-1958] p 752 A86-45443
An experimental and theoretical investigation of the propagation of sound waves through a turbulent boundary layer
[AIAA PAPER 86-1968] p 753 A86-45451
Development of an impulsive noise source to study the acoustic reflection characteristics of hard-walled wind tunnels
[AIAA PAPER 86-1887] p 755 A86-45500
Acoustic reflection contamination measurements in the 16-foot NASA Langley Transonic Wind Tunnel
[AIAA PAPER 86-1888] p 755 A86-45501

**SPACE ENVIRONMENT SIMULATION**
Arnold Engineering Development Center - Simulators encompass spectrum of aerospace environments
p 730 A86-45673

**SPACE SHUTTLE ORBITERS**
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233

**SPACE SHUTTLES**
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] p 693 N86-29772

**SPACECRAFT CONSTRUCTION MATERIALS**
The need for rapidly solidified powder metallurgy aluminum alloys for aerospace applications
p 732 A86-46827

**SPACECRAFT PROPULSION**
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454

**SPACECRAFT STRUCTURES**
Reconstruction of forcing functions based on measured structural responses
p 732 N86-30684

**SPANWISE BLOWING**
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690

**SPATIAL MARCHING**
Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method
[ONERA, TP NO. 1986-29] p 692 A86-46171

**SPECIFICATIONS**
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] p 705 N86-30714

**SPECIMEN GEOMETRY**
Mode II fatigue crack growth specimen development
p 736 A86-43566

**SPECTRAL METHODS**
Identification of aeroelastic phenomenon employing bispectral analysis techniques
p 740 A86-47124

**SPECTRUM ANALYSIS**
Sensitivity, noise and optical crosstalk in heterodyne acousto-optical signal processors
p 740 A86-46701
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] p 723 N86-30735

**SPIN STABILIZATION**
Navy departure/spin and air combat maneuvering evaluation of a National Aeronautics and Space Administration developed flight control system for the F-14
p 724 A86-44944

**STABILITY**
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] p 726 N86-29866

**STABILITY AUGMENTATION**
Design and research of aircraft parameter-adaptive lateral command augmentation systems
p 723 A86-43498
Preliminary design of low authority SAS. II --- stability augmentation system
p 724 A86-45058

**STABILIZATION**
An inertial navigation system with single-axis stabilization
p 702 A86-43484
Advanced laser based inertial instrument development
[AD-A166307] p 742 N86-30128

**STAGNATION PRESSURE**
Experiments on high speed ejectors
[NASA-CR-177419] p 721 N86-29820

**STANDARDS**
Aircraft noise measurement - Alternatives to the standard 1-2 metres microphone height
[AIAA PAPER 86-1960] p 752 A86-45445
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801
Safety fuels-specifications and progress
p 734 N86-30018
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] p 705 N86-30711

**STATE VECTORS**
Optimal landing of a helicopter in autorotation
[NASA-CR-177032] p 714 N86-29809

**STATIC AERODYNAMIC CHARACTERISTICS**
Static aeroelastic analysis using aircraft vibration modes
p 743 N86-30641

**STATIC ELECTRICITY**
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] p 702 N86-30708

**STATIC TESTS**
Experimental study of flight effect on fan noise. I - A study of inflow control device for simulating in-flight fan noise in static test
p 721 A86-46024
Propeller FOD qualification using modal analysis, artificial birds, and a static impact facility
p 731 A86-47127

**STATOR BLADES**
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492

**STEADY FLOW**
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow
p 695 N86-30632

**STEERING**
Technique for measuring side forces on a banked aircraft with a free-swiveling nose gear
[NASA-TM-87719] p 743 N86-30233

**STIFFENING**
The influence of slow growth and net section yielding on the residual strength of stiffened structure
p 737 A86-43793
Fracture diagrams for stiffened aircraft structures - Effects of material non-linearity
p 737 A86-43794
Optimization of stiffened panels under compression
p 739 A86-45762

**STOCHASTIC PROCESSES**
The near and far acoustic fields of broadband shock associated noise
[AIAA PAPER 86-1943] p 751 A86-45430

**STRAIN GAGES**
Fiber optic sensors for flexure measurement of aircraft structures
p 739 A86-46135

**STRAPDOWN INERTIAL GUIDANCE**
Technology research for strapdown inertial experiment and digital flight control and guidance
[NASA-CR-176907] p 703 N86-29800

**STRATIFIED FLOW**
A quasi-one-dimensional model for the evolution of the turbulent wake of a body in a stratified medium
p 738 A86-45231

**STREAMLINED BODIES**
The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem
p 690 A86-45189

**STRESS ANALYSIS**
Determining component loads and stresses with improved system modeling techniques
p 740 A86-47122

**STRESS-STRAIN DIAGRAMS**
Fracture diagrams for stiffened aircraft structures - Effects of material non-linearity
p 737 A86-43794

**STRUCTURAL ANALYSIS**
Computer aided engineering in structural design and optimization
p 736 A86-43759
An iterative method for statically indeterminate structures of flight vehicle
p 738 A86-45059

**STRUCTURAL DESIGN**
Computer aided engineering in structural design and optimization
p 736 A86-43759
Damage tolerance test program of the Fokker 100
p 706 A86-43786
Residual strength characterization of jet transport structures
p 707 A86-43795
Optimization of stiffened panels under compression
p 739 A86-45762
Computations and turbulent flow modeling in support of helicopter rotor technology
[NASA-CR-177095] p 742 N86-30090
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing
p 715 N86-30654
Structural optimization programs and methods --- aircraft weight reduction
p 715 N86-30655
Variation of anisotropic behavior in structural optimization --- aircraft composite structures
p 715 N86-30656
Effects of anisotropic design on the static aeroelasticity of a swept wing --- aeroelastic tailoring
p 687 N86-30661
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane
p 715 N86-30662
Advisory Circular: Auxiliary fuel system installations
[FAA/AC-25-8] p 716 N86-30719
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] p 717 N86-30726
High accuracy fuel flowmeter
[NASA-CR-174869] p 745 N86-31030
A study of methods to predict and measure the transmission of sound through the walls of light aircraft
[NASA-CR-177147] p 757 N86-31335

**STRUCTURAL DESIGN CRITERIA**
Damage tolerance - USAF experience
p 736 A86-43794
Mechanical design of gas turbine blading in cast superalloys
p 721 A86-45819

**STRUCTURAL ENGINEERING**
Computer aided engineering in structural design and optimization p 736 A86-43759
**STRUCTURAL FAILURE**
National Transportation Safety Board safety recommendation
[NTSB-4357/1] p 699 N86-29792
**STRUCTURAL RELIABILITY**
Durability and damage tolerance in aircraft design: Proceedings of the Thirteenth Symposium, Pisa, Italy, May 22-24, 1985 p 706 A86-43776
Continuing structural integrity program for transport aircraft p 736 A86-43789
**STRUCTURAL STABILITY**
Stability analysis of composite stiffened layer plates under compression p 735 A86-43495
The vibration and stability of symmetrically-laminated composite rectangular plates subjected to in-plane stresses p 739 A86-45694
An investigation of empennage buffeting
[NASA-CR-176973] p 726 N86-29864
Impact data from a transport aircraft during a controlled impact demonstration
[NASA-TP-2589] p 716 N86-30721
**STRUCTURAL STRAIN**
Predicted and measured strain response of rectangular panels due to acoustic loading
[AIAA PAPER 86-1931] p 751 A86-45421
Response of symmetric rectangular composite laminates with nonlinear damping subjected to acoustic loading
[AIAA PAPER 86-1933] p 738 A86-45422
**STRUCTURAL VIBRATION**
Sensitivity analysis of parameters in solving inverse problem of structural dynamics p 736 A86-43502
Structural influence of cabin floor on sound transmission into propeller aircraft - Analytical investigations
[AIAA PAPER 86-1940] p 711 A86-45427
The vibration and stability of symmetrically-laminated composite rectangular plates subjected to in-plane stresses p 739 A86-45694
New modal identification methods applied to aeronautical structures
[ONERA, TP NO. 1986-35] p 713 A86-46177
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 716 N86-30678
Modified US Army U-8F ground vibration test
[NASA-TM-86741] p 717 N86-30723
**STRUTS**
Experimental investigation of unsteady fan flow interaction with downstream struts
[AIAA PAPER 86-1870] p 739 A86-45490
Rotor-strut interaction noise of a model fan
[AIAA PAPER 86-1871] p 755 A86-45491
**SUBSONIC FLOW**
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow p 695 N86-30632
Application of unsteady wing collocation methods to cascades in subsonic flow p 696 N86-30636
**SUBSONIC FLUTTER**
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] p 727 N86-29870
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model p 728 N86-30649
**SUCTION**
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] p 715 N86-29815
**SUPERCOMPUTERS**
Impact of supercomputers on the next decade of computational fluid dynamics p 740 A86-46788
**SUPERCRITICAL AIRFOILS**
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] p 696 N86-30691
**SUPERCRITICAL WINGS**
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment
[ONERA-RT-24/3064-RY-044-R] p 695 N86-29786
**SUPERSONIC AIRCRAFT**
Rafale will keep tricolor flying --- experimental combat aircraft p 707 A86-44003
New technologies for a European fighter p 708 A86-44004
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft
[NASA-TM-86265] p 714 N86-29813
**SUPERSONIC COMBUSTION RAMJET ENGINES**
Propelling the aerospace plane p 720 A86-43910
Investigation of the ignition characteristics of hydrogen/air mixtures in the case of combustion induced by oblique shocks p 732 A86-45185
**SUPERSONIC CRUISE AIRCRAFT RESEARCH**
British experimental aircraft program providing insight into new technology p 710 A86-45064
**SUPERSONIC FLOW**
A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds p 687 A86-43485
Role of shocks in transonic/supersonic compressor rotor flutter p 720 A86-44872
Unified supersonic/hypersonic similitude for oscillating wedges and plane ogives p 689 A86-44880
Pressure loading on curved leading edge wings in supersonic flow p 689 A86-44890
Numerical solution of the supersonic laminar flow over a two-dimensional compression corner using an implicit approach p 690 A86-45054
Investigation of the ignition characteristics of hydrogen/air mixtures in the case of combustion induced by oblique shocks p 732 A86-45185
The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem p 690 A86-45189
Scheme for calculating an almost-asymmetric gas flow and supersonic flow past the end of a cylinder at a small angle of attack p 690 A86-45345
On the screech tones of supersonic rectangular jets
[AIAA PAPER 86-1866] p 754 A86-45486
Unfolding of degenerate Hopf bifurcation for supersonic flow past a pitching wedge p 725 A86-46456
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 695 N86-30633
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 696 N86-30634
**SUPERSONIC JET FLOW**
Coherent large-scale structures in high Reynolds number supersonic jet of Mach number 1.4
[AIAA PAPER 86-1941] p 691 A86-45428
The near and far acoustic fields of broadband shock associated noise
[AIAA PAPER 86-1943] p 751 A86-45430
High speed flight effects on shock associated noise
[AIAA PAPER 86-1944] p 751 A86-45431
Shock noise from supersonic jets in simulated flight to Mach 0.4
[AIAA PAPER 86-1945] p 752 A86-45432
Aeroacoustics of contoured plug-nozzle supersonic jet flows
[AIAA PAPER 86-1946] p 752 A86-45433
Features of discrete tones generated by jet flows over Coanda surfaces
[AIAA PAPER 86-1865] p 691 A86-45485
**SUPERSONIC NOZZLES**
Acoustic properties associated with rectangular geometry supersonic nozzles
[AIAA PAPER 86-1867] p 754 A86-45487
**SUPERSONIC SPEED**
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764
**SUPERSONIC WIND TUNNELS**
Boundary layer stability measurements over a flat plate at mach 3
[AD-A166188] p 694 N86-29778
**SURFACE CRACKS**
Ultrasonic direct backscattering technique for material surface inspection p 740 A86-47133
**SURFACE PROPERTIES**
Features of discrete tones generated by jet flows over Coanda surfaces
[AIAA PAPER 86-1865] p 691 A86-45485
**SURFACE ROUGHNESS**
Investigations for improving operational reliability and maintainability of instrument landing system components. Volume 1: Text and appendices
[DOT/FAA/PM-86/7,1-VOL-1] p 704 N86-29801
**SURFACE ROUGHNESS EFFECTS**
Simulation of aircraft taxi testing on the AGILE shaker test facility p 731 N86-30663
**SURFACES**
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 696 N86-30634
**SURGES**
Active suppression of compressor instabilities
[AIAA PAPER 86-1914] p 690 A86-45410
**SURVEILLANCE**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728
**SURVIVAL**
Automatic Inflation Modulation (A.I.M.) parachute up-date p 698 A86-44781
**SWEEP EFFECT**
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492
**SWEPT FORWARD WINGS**
The application of practical optimization techniques in the preliminary structural design of a forward-swept wing p 715 N86-30654
Effects of anisotropic design on the static aeroelasticity of a swept wing --- aeroelastic tailoring p 687 N86-30661
**SWEPT WINGS**
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] p 745 N86-31010
**SWEPTBACK WINGS**
Spiral vortex flow over a swept-back wing p 691 A86-46004
Numerical calculations of inviscid transonic flows over wings p 692 A86-46415
**SYNCHRONISM**
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] p 726 N86-29866
**SYNCHROPHASING**
Noise control characteristics of synchrophasing. I Analytical investigation --- of turboprop aircraft noise p 708 A86-44853
**SYSTEM EFFECTIVENESS**
The effect of deposits on the cooling efficiency of gas-turbine engine blades p 720 A86-44697
**SYSTEM FAILURES**
Robust detection, isolation and accommodation for sensor failures
[NASA-CR-174825] p 722 N86-30732
**SYSTEMS ANALYSIS**
Experience with synchronous and asynchronous digital control systems
[NASA-TM-88271] p 726 N86-29866
Finite state modelling of aeroelastic systems for active control applications: A general theory p 749 N86-30648
**SYSTEMS INTEGRATION**
Generic integrated maintenance diagnostics p 685 A86-44422
**SYSTEMS SIMULATION**
A simulation of an integrated flight control/air-ground cannon firing system
[ONERA, TP NO. 1986-31] p 725 A86-46173
**SYSTEMS STABILITY**
An inertial navigation system with single-axis stabilization p 702 A86-43484
Disturbance attenuation by a frequency-shaped linear-quadratic-regulator method --- applied to design of feedback control system for aircraft gust alleviation p 725 A86-46453

## T

**TAIL ASSEMBLIES**
Optimizing the NOTAR design p 708 A86-44460
An investigation of empennage buffeting
[NASA-CR-176973] p 726 N86-29864
**TAILLESS AIRCRAFT**
Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane p 715 N86-30662
**TAKEOFF**
Optimal take-off trajectories in the presence of windshear p 708 A86-44386
**TAKEOFF RUNS**
Ground resonance of a helicopter during the take-off and landing run p 712 A86-45749
**TARGET ACQUISITION**
A survey of multiple targets tracking technique p 735 A86-43489
A simulation of an integrated flight control/air-ground cannon firing system
[ONERA, TP NO. 1986-31] p 725 A86-46173
**TAXIING**
Ground resonance of a helicopter during the take-off and landing run p 712 A86-45749
Simulation of aircraft taxi testing on the AGILE shaker test facility p 731 N86-30663
**TECHNOLOGICAL FORECASTING**
Trends in civil avionics for the near future p 718 A86-46141
**TECHNOLOGY ASSESSMENT**
Line replaceable modules - The next generation of avionics p 685 A86-43690
Fundamentals of aviation technology and airport equipment --- Russian book p 685 A86-44291

New levels of realism achieved in visuals for flight simulation p 730 A86-46148
**TEMPERATURE DISTRIBUTION**
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856
**TEMPERATURE MEASUREMENT**
A system for introducing mutual corrections into the airborne temperature and air-speed meters p 738 A86-45208
The accuracy of air-temperature and flight-altitude measurements aboard meteorological aircraft p 718 A86-45209
**TERMINAL FACILITIES**
Fundamentals of aviation technology and airport equipment --- Russian book p 685 A86-44291
**TERRAIN FOLLOWING AIRCRAFT**
Tornado high speed terrain following testing in mountainous terrain and bad weather p 710 A86-44945
**TEST FACILITIES**
Landing gear test facilities examined p 730 A86-44458
Arnold Engineering Development Center - Simulators encompass spectrum of aerospace environments p 730 A86-45673
Arnold Engineering Development Center - New facility to assess engine-airframe compatibility prior to first flight p 730 A86-45674
Requirements and recommendations for the development of theoretical codes and experimental facilities in the near future --- for aircraft design [ONERA, TP NO. 1986-10] p 731 A86-46155
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench [ONERA-RT-95/7108-RY-054-R] p 743 N86-30219
Simulation of aircraft taxi testing on the AGILE shaker test facility p 731 N86-30663
**TEXTBOOKS**
Methods of the assembly of aircraft instrumentation and systems --- Russian book p 685 A86-44284
**THERMAL PROTECTION**
Cooling techniques for turbojet pre-heater channels p 741 N86-29847
**THIN WINGS**
A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds p 687 A86-43485
Lifting-line solution for a symmetrical thin wing in ground effect p 689 A86-44874
**THREE DIMENSIONAL BODIES**
Rectangular parallelepiped coding - A volumetric representation of three-dimensional objects p 747 A86-45473
**THREE DIMENSIONAL BOUNDARY LAYER**
Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method [ONERA, TP NO. 1986-29] p 692 A86-46171
Three-dimensional shock wave and turbulent boundary layer interactions [AD-A167086] p 745 N86-31010
**THREE DIMENSIONAL FLOW**
A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds p 687 A86-43485
Some problems in the finite-difference computation of three-dimensional transonic flows p 687 A86-43501
Computation of rotor blade flows using the Euler equations p 689 A86-44891
Axisymmetric three-dimensional flow in the cooled gas turbine --- German thesis p 720 A86-44925
Three-dimensional inviscid flow in mixers. II - Analysis of turbofan forced mixers p 692 A86-46316
Remarks on the development of a multiblock three-dimensional Euler code for out of core and multiprocessor calculations p 748 A86-46791
Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings p 695 N86-30629
**THRUST**
Experimental and theoretical study of propeller spinner/shank interference [NASA-CR-176954] p 694 N86-29773
**THRUST AUGMENTATION**
Experiments on high speed ejectors [NASA-CR-177419] p 721 N86-29820
**THRUST MEASUREMENT**
Development of in-flight thrust measurement procedures for an afterburning turbofan engine [AIAA PAPER 85-1405] p 720 A86-45375
**THRUST VECTOR CONTROL**
NASA's Langley Center making gains in advanced technology projects p 686 A86-45065
Vectored thrust digital flight control for crew escape, volume 1 [AD-A166580] p 700 N86-29796
Vectored thrust digital flight control for crew escape, volume 2 [AD-A166596] p 700 N86-29790
International Aviation (selected articles) [AD-A166748] p 687 N86-30690
The performance evaluation of a jet flap on an advanced supersonic harrier [NASA-CR-179653] p 716 N86-30722
**THUNDERSTORMS**
Development of airborne electric field and lightning detection instrumentation for aviation safety. [AD-A167342] p 701 N86-30705
**TILT ROTOR AIRCRAFT**
The XV-15 Tilt-Rotor flight-test program p 709 A86-44938
Feasibility study for convertible engine torque converter [NASA-CR-175082] p 722 N86-30733
**TILT ROTOR RESEARCH AIRCRAFT PROGRAM**
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download [NASA-CR-176970] p 693 N86-29769
**TILTING ROTORS**
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download [NASA-CR-176970] p 693 N86-29769
**TIME DEPENDENCE**
Pseudo-time algorithms for the Navier-Stokes equations [NASA-CR-178127] p 694 N86-29776
**TOLERANCES (MECHANICS)**
Fatigue and damage tolerance work during the aircraft design process p 706 A86-43777
Damage tolerance - USAF experience p 736 A86-43784
U.S. Army requirements for damage tolerance of composite helicopter structure p 706 A86-43785
Damage tolerance test program of the Fokker 100 p 706 A86-43786
Airbus Industrie A310 and A300-600 experience with practical applications of damage tolerance design in fuselage primary structure p 707 A86-43787
Continued airworthiness of damage tolerant aircraft p 707 A86-43788
Damage tolerance and durability in the design of a short-haul turboprop aircraft p 707 A86-43790
Maintenance system by means of damage tolerance principle p 736 A86-43791
**TOLERANCES (PHYSIOLOGY)**
Halon extinguisher agent behavior in a ventilated small aircraft [DOT/FAA/CT-86/5] p 699 N86-29794
**TORQUE**
Experimental and theoretical study of propeller spinner/shank interference [NASA-CR-176954] p 694 N86-29773
**TORQUE CONVERTERS**
Feasibility study for convertible engine torque converter [NASA-CR-175082] p 722 N86-30733
**TORSIONAL STRESS**
Aeroelastic considerations for torsionally soft rotors [NASA-TM-87687] p 745 N86-31070
**TOWERS**
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface [AD-A166899] p 705 N86-30714
**TRAILING EDGES**
Motion and interaction of decaying trailing vortices in spanwise shear wind [NASA-TP-2599] p 687 N86-29762
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft [NASA-TM-88265] p 714 N86-29813
**TRAINING AIRCRAFT**
CFRP-wing for the Alpha jet p 686 A86-46199
**TRAINING SIMULATORS**
Northrop's surrogate trainer --- simulating AH-64A helicopter p 709 A86-44941
Liquid-crystal goggles permit visual simulations of restricted visibility p 716 A86-46150
**TRAJECTORY ANALYSIS**
Use of block-pulse functions in the optimal control of deterministic systems p 747 A86-45728
**TRAJECTORY OPTIMIZATION**
Optimal take-off trajectories in the presence of windshear p 706 A86-44386
**TRANSDUCERS**
Analogue signal conditioning for flight test instrumentation [AGARD-AG-160-VOL-17] p 719 N86-29816
**TRANSFER FUNCTIONS**
Comparison of modal analysis methods on a light aircraft p 730 A86-44933
Cabin noise characteristics of a small propuller powered aircraft [AIAA PAPER 86-1906] p 710 A86-45407
New modal identification methods applied to aeronautical structures [ONERA, TP NO. 1986-35] p 713 A86-46177
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461
**TRANSFORMATIONS (MATHEMATICS)**
A fast shape descriptor p 748 A86-46377
**TRANSIENT OSCILLATIONS**
Multi shaker modal testing using a modified transient random excitation p 740 A86-47107
**TRANSIENT RESPONSE**
Transient induced drag p 689 A86-44870
**TRANSMISSION LINES**
Transmission line design for a power distribution system at 20 kHz for aircraft [NASA-CR-3987] p 721 N86-29818
**TRANSONIC COMPRESSORS**
Unsteady design-point flow phenomena in transonic compressors [NASA-CR-176879] p 72[illegible] N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor [AD-A166759] p 723 N86-30734
**TRANSONIC FLOW**
Some problems in the finite-difference computation of three-dimensional transonic flows p 687 A86-43501
The reverse-flow theorem for transonic flow p 688 A86-44802
Far-field boundary conditions for transonic lifting solutions to the Euler equations p 689 A86-44855
Role of shocks in transonic/supersonic compressor rotor flutter p 720 A86-44872
Transonic aeroelastic analysis of the B-1 wing [AIAA PAPER 85-0690] p 706 A86-44886
Computation of rotor blade flows using the Euler equations p 689 A86-44891
10 years of rotor flows studies at ONERA - State of the art and future studies [ONERA, TP NO. 1986-49] p 692 A86-46185
Numerical calculations of inviscid transonic flows over wings p 692 A86-46415
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation [NASA-TM-88248] p 692 N86-29765
Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment [ONERA-RT-24/3064-RY-044-R] p 695 N86-29786
Transonic equivalent strip method for aeroelastic applications p 695 N86-30628
Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings p 695 N86-30629
Application of transonic unsteady methods for calculation of flutter airloads p 727 N86-30630
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 695 N86-30631
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow p 695 N86-30632
A review of aeroelastic research at the Flight Dynamics Laboratory p 727 N86-30642
The method of complex characteristics for design of transonic blade sections [NASA-CR-176978] p 696 N86-30691
Numerical studies of porous airfoils in transonic flow [NASA-CR-179655] p 697 N86-30696
**TRANSONIC FLUTTER**
Transonic equivalent strip method for aeroelastic applications p 695 N86-30628
**TRANSONIC SPEED**
Calculation of transonic rotor noise using a frequency domain formulation [AIAA PAPER 86-1901] p 750 A86-45402
**TRANSONIC WIND TUNNELS**
Development of an impulsive noise source to study the acoustic reflection characteristics of hard-walled wind tunnels [AIAA PAPER 86-1887] p 755 A86-45500
Acoustic reflection contamination measurements in the 16-foot NASA Langley Transonic Wind Tunnel [AIAA PAPER 86-1888] p 755 A86-45501
Correlation of transonic-cone preston-tube data and skin friction [NASA-CR-176902] p 693 N86-29771

Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] p 715 N86-29815
Cryogenic wind tunnels for high Reynolds number testing
[NASA-TM-87743] p 731 N86-29872

**TRANSPORT AIRCRAFT**
Continuing structural integrity program for transport aircraft p 736 A86-43789
Maintenance system by means of damage tolerance principle p 736 A86-43791
Residual strength characterization of jet transport structures p 707 A86-43795
Task Force report on emergency evacuation of transport airplanes, volume 1
[DOT/FAA/VS-86/1.1] p 699 N86-29793
Task force report on emergency evacuation of transport airplanes. Volume 2: Supporting documentation
[FAA/VS-86/1.2] p 700 N86-29797
Seat experiment results of full-scale transport aircraft controlled impact demonstration
[DOT/FAA/CT-85/25] p 701 N86-30702
Fire extinguishing agents for oxygen-enriched atmospheres
[AD-A166967] p 743 N86-30890

**TURBINE BLADES**
Mechanical design of gas turbine blading in cast superalloys p 721 A86-45819
National Transportation Safety Board safety recommendation
[NTSB-4360/33] p 699 N86-29791
Self-retained platform cooling plate for turbine vane
[AD-D012216] p 721 N86-29822
Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins
p 741 N86-29827
Wake-passing in a turbine rotor cascade
p 741 N86-29830
A model for correlating flat plate film cooling effectiveness for rows of round holes
p 741 N86-29840
Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
Theoretical flutter investigations on a plane cascade in incompressible flow --- axial flow compressors and turbines p 727 N86-30635
Application of unsteady wing collocation methods to cascades in subsonic flow p 696 N86-30636

**TURBINE ENGINES**
Superalloy component durability enhancements
p 739 A86-46562
National Transportation Safety Board safety recommendation
[NTSB-4360/33] p 699 N86-29791

**TURBINE WHEELS**
Dynamic analysis of structures with flexible rotors --- aircraft engines p 722 N86-30664

**TURBOCOMPRESSORS**
Active suppression of compressor instabilities
[AIAA PAPER 86-1914] p 690 A86-45410
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] p 743 N86-30219
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] p 722 N86-30730
Time resolved and time averaged flow evaluation for an isolated transonic compressor rotor
[AD-A166759] p 723 N86-30734

**TURBOFAN ENGINES**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
Development of in-flight thrust measurement procedures for an afterburning turbofan engine
[AIAA PAPER 85-1405] p 720 A86-45375
Experimental investigation of unsteady fan flow interaction with downstream struts
[AIAA PAPER 86-1870] p 739 A86-45490
Experimental study of flight effect on fan noise. I - A study of inflow control device for simulating in-flight fan noise in static test p 721 A86-46024
Three-dimensional inviscid flow in mixers. II - Analysis of turbofan forced mixers p 692 A86-46316
Noise predictions of a high bypass turbofan engine using the Lockheed Near-Field Noise Prediction Program
[NASA-CR-178146] p 756 N86-30469
Feasibility study for convertible engine torque converter
[NASA-CR-175082] p 722 N86-30733

**TURBOFANS**
Modelling of acoustic radiation problems associated with turbomachinery and rotating blades p 749 A86-44805

**TURBOJET ENGINES**
Propelling the aerospace plane p 720 A86-43910
Self-retained platform cooling plate for turbine vane
[AD-D012216] p 721 N86-29822
Cooling techniques for turbojet pre-heater channels
p 741 N86-29847
Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858
Jet-engine combustor spectral radiation measurements using fiberoptic instrumentation system. Radiant energy power source for jet aircraft
[DE86-007289] p 723 N86-30735

**TURBOMACHINE BLADES**
The effect of deposits on the cooling efficiency of gas-turbine engine blades p 720 A86-44697
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings --- conference
[VKI-LS-1986-02] p 744 N86-30988

**TURBOMACHINERY**
Modelling of acoustic radiation problems associated with turbomachinery and rotating blades p 749 A86-44805

**TURBOPROP AIRCRAFT**
Damage tolerance and durability in the design of a short-haul turboprop aircraft p 707 A86-43790
Noise control characteristics of synchrophasing. I Analytical investigation --- of turboprop aircraft noise
p 708 A86-44853
Structureborne noise investigations of a twin engine aircraft
[AIAA PAPER 86-1905] p 710 A86-45406
Advanced turboprop aircraft noise annoyance - A review of recent NASA research
[AIAA PAPER 86-1959] p 752 A86-45444
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding
[AIAA PAPER 86-1966] p 711 A86-45449
Acoustic reflection contamination measurements in the 16-foot NASA Langley Transonic Wind Tunnel
[AIAA PAPER 86-1888] p 755 A86-45501
Corporate flying, Italian style p 712 A86-45753
Dynamic and flutter analysis using F.E.M. of the GP-180 --- turboprop aircraft p 713 A86-47128

**TURBOPROP ENGINES**
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 738 A86-45256
Development of an impulsive noise source to study the acoustic reflection characteristics of hard-walled wind tunnels
[AIAA PAPER 86-1887] p 755 A86-45500
Advanced turboprop noise prediction: Development of a code at NASA Langley based on recent theoretical results
[NASA-TM-88993] p 757 N86-31338

**TURBOSHAFTS**
Multi-variable control of the GE T700 engine using the LOG/LTR design methodology
[NASA-CR-177080] p 721 N86-29819

**TURBULENCE**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741

**TURBULENCE EFFECTS**
Rotor noise due to atmospheric turbulence ingestion. II Aeroacoustic results
[AIAA PAPER 86-1903] p 750 A86-45404
Rotor noise due to atmospheric turbulence ingestion. I - Fluid mechanics
[AIAA PAPER 86-1857] p 754 A86-45479

**TURBULENT BOUNDARY LAYER**
Measurements of fluctuations of surface heat transfer rate in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43512
Fluctuations of wall pressure in the interacting region of oblique shock wave and turbulent boundary layer
p 688 A86-43514
An experimental and theoretical investigation of the propagation of sound waves through a turbulent boundary layer
[AIAA PAPER 86-1968] p 753 A86-45451
Three-dimensional shock wave and turbulent boundary layer interactions
[AD-A167086] p 745 N86-31010

**TURBULENT FLOW**
Application of unsteady aerodynamics to large-eddy breakup devices in a turbulent flow p 688 A36-44238
An experimental investigation of wing tip turbulence with applications to aerosound
[AIAA PAPER 86-1918] p 691 A86-45413
Tone-like noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1947] p 752 A86-45434
Numerical computation of viscous flow around bodies and wings moving at supersonic speeds
[NASA-CR-176903] p 693 N86-29772
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] p 722 N86-30731
Aerodynamics of seeing on large transport aircraft
[NASA-CR-177035] p 758 N86-31357

**TURBULENT JETS**
The pressure field generated by jet-jet impingement
[AIAA PAPER 86-1951] p 739 A86-45437
The noise emitted by turbulent jets in close proximity to solid surfaces
[AIAA PAPER 86-1869] p 755 A86-45489

**TURBULENT MIXING**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782

**TURBULENT WAKES**
A quasi-one-dimensional model for the evolution of the turbulent wake of a body in a stratified medium
p 738 A86-45231
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] p 693 N86-29768

**TURING MACHINES**
Finite state modelling of aeroelastic systems for active control applications: A general theory
p 749 N86-30648

**TURNING FLIGHT**
The concept of almost-parallel IFR (Instrument Flight Rules) approaches to parallel runways
[AD-A166485] p 704 N86-29804

**TWO DIMENSIONAL BODIES**
Broad band noise from an isolated two dimensional airfoil
[AIAA PAPER 86-1948] p 752 A86-45435
Surface pressure measurement during low speed two-dimensional blade-vortex interaction
[AIAA PAPER 86-1856] p 753 A86-45478
Navier-Stokes computations for exotic airfoils
[AIAA-85-0109] p 745 N86-30996

**TWO DIMENSIONAL FLOW**
Numerical solution of the supersonic laminar flow over a two-dimensional compression corner using an implicit approach p 690 A86-45054
A quasi-one-dimensional model for the evolution of the turbulent wake of a body in a stratified medium
p 738 A86-45231
Comparison of experimental surface pressures with theoretical predictions on twin two-dimensional convergent-divergent nozzles
[NASA-TM-87757] p 697 N86-30694
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] p 722 N86-30731

**TWO DIMENSIONAL JETS**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782

**U**

**ULTRASONIC FLAW DETECTION**
Ultrasonic direct backscattering technique for material surface inspection p 740 A86-47133

**UNSTEADY FLOW**
A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds
p 687 A86-43485
Application of unsteady aerodynamics to large-eddy breakup devices in a turbulent flow p 688 A86-44238
Transient induced drag p 689 A86-44879
The wing tip vortex system in a starting flow
p 690 A86-45190
Experimental investigation of unsteady fan flow interaction with downstream struts
[AIAA PAPER 86-1870] p 739 A86-45490
Preliminary instrumentation for aeroelastic tests at the compressor level --- turbocompressor test bench
[ONERA-RT-95/7108-RY-054-R] p 743 N86-30219
Exact closed-form solutions for nonlinear unsteady transonic aerodynamics p 695 N86-30631
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow
p 695 N86-30632
An exact formulation of the unsteady aerodynamic theory of lifting surfaces undergoing arbitrary small motions in a supersonic flow field p 696 N86-30634
Application of unsteady wing collocation methods to cascades in subsonic flow p 696 N86-30636
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity
p 696 N86-30638

Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] p 722 N86-30730

**UNSTEADY STATE**
An entropy correction method for unsteady full potential flows with strong shocks
[NASA-TM-87769] p 694 N86-29777

**UPWASH**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782

**USER MANUALS (COMPUTER PROGRAMS)**
The method of complex characteristics for design of transonic blade sections
[NASA-CR-176978] p 696 N86-30691

## V

**V/STOL AIRCRAFT**
Control of V/STOL aircraft p 724 A86-46002
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] p 716 N86-30722

**VANES**
Self-retained platform cooling plate for turbine vane
[AD-D012218] p 721 N86-29822

**VARIABLE GEOMETRY STRUCTURES**
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482

**VARIABLE SWEEP WINGS**
Pressure loading on curved leading edge wings in supersonic flow p 689 A86-44890

**VENTILATION**
Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856

**VERY HIGH FREQUENCY RADIO EQUIPMENT**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908

**VERY LOW FREQUENCIES**
VLF radio navigation systems --- Russian book
p 703 A86-44279
Minimum operational performance standards for airborne area navigation equipment using Omega/VLF inputs
[RTCA/DO-190] p 705 N86-30711

**VHF OMNIRANGE NAVIGATION**
Simulation of the algorithms of a navigation computer
p 748 A86-46369

**VIBRATION**
Study of new flight test techniques
[NASA-CR-176952] p 714 N86-29812
Structureborne noise in aircraft: Modal tests
[NASA-TM-87739] p 757 N86-31339

**VIBRATION DAMPING**
The role of structural and aerodynamic damping on the aeroelastic behavior of wings p 708 A86-44894
Response of symmetric rectangular composite laminates with nonlinear damping subjected to acoustic loading
[AIAA PAPER 86-1933] p 736 A86-45422
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] p 727 N86-29870
Structural dynamic aspects of rotor nodal isolation --- helicopters p 715 N86-30665

**VIBRATION MODE**
Structural modification by modal correction
p 738 A86-44934
Vibration analysis of a helicopter fuselage by means of mathematical models p 725 A86-46368
Digital data acquisition system for modal testing --- of aircraft p 731 A86-47093
Multi shaker modal testing using a modified transient random excitation p 740 A86-47107
Static aeroelastic analysis using aircraft vibration modes p 743 N86-30641
Rapid vibration mode analysis of aircraft with external stores p 716 N86-30679

**VIBRATION SIMULATORS**
Multi shaker modal testing using a modified transient random excitation p 740 A86-47107

**VIBRATION TESTS**
Comparison of modal analysis methods on a light aircraft p 730 A86-44933
Structural modification by modal correction
p 738 A86-44934
The methods implemented at ONERA to improve airplane ground vibration tests
[ONERA, TP NO. 1986-8] p 713 A86-46153
Digital data acquisition system for modal testing --- of aircraft p 731 A86-47093
A comparison of methods for aircraft ground vibration testing p 713 A86-47096
Multi shaker modal testing using a modified transient random excitation p 740 A86-47107
Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] p 727 N86-29870
Advances in ground vibration testing using a combination of phase resonance and phase separation methods --- aircraft testing p 743 N86-30669
Modified US Army U-8F ground vibration test
[NASA-TM-86741] p 717 N86-30723

**VIBRATORY LOADS**
Aeroelastic considerations for torsionally soft rotors
[NASA-TM-87687] p 745 N86-31070

**VISCOELASTICITY**
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013

**VISCOSITY**
Heat transfer, friction, and rheological characteristics of antimisting kerosene p 734 N86-30013
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] p 701 N86-30022

**VISCOUS DRAG**
Design and fabrication of large suction panels with perforated surfaces for laminar flow control testing in a transonic wind tunnel
[NASA-TM-89011] p 715 N86-29815

**VISCOUS FLOW**
Hypersonic viscous shock layer on a surface with an abrupt variation of catalytic activity p 737 A86-43994
Viscous-inviscid interaction solvers and computation of highly separated flows
[ONERA, TP NO. 1986-4] p 691 A86-46152
Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method
[ONERA, TP NO. 1986-29] p 692 A86-46171
Thermodynamic evaluation of transonic compressor rotors using the finite volume approach
[NASA-CR-176947] p 722 N86-30731
Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings --- conference
[VKI-LS-1986-02] p 744 N86-30988

**VOICE COMMUNICATION**
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] p 744 N86-30907

**VORTEX BREAKDOWN**
On slender vortices p 689 A86-44810
An approximate model of vortex decay in the atmosphere p 689 A86-44889

**VORTEX FILAMENTS**
Surface pressure measurement during low speed two-dimensional blade-vortex interaction
[AIAA PAPER 86-1856] p 753 A86-45478

**VORTEX FLAPS**
PAN AIR application to the F-106B
[NASA-CR-178165] p 698 N86-30698

**VORTEX SHEDDING**
Dynamic stall - The case of the vertical axis wind turbine p 746 A86-44150
Application of unsteady aerodynamics to large-eddy breakup devices in a turbulent flow p 686 A86-44238

**VORTEX SHEETS**
Vortex sheet modeling with higher order curved panels
[NASA-CR-176971] p 693 N86-29770

**VORTICES**
Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477
Flows past a rotating circular cylinder at high Reynolds number p 688 A86-43533
On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803
Calculation of the potential flow around wing profiles with the aid of a continuously differentiable vortex distribution p 689 A86-44979
Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401
Control of the discrete vortices from a delta wing
[AIAA PAPER 86-1915] p 690 A86-45411
Propeller noise caused by blade tip radial forces
[AIAA PAPER 86-1892] p 721 A86-45504
Spiral vortex flow over a swept-back wing
p 691 A86-46004
High resolution solutions of the Euler equations for vortex flows p 692 A86-46793
Motion and interaction of decaying trailing vortices in spanwise shear wind
[NASA-TP-2599] p 687 N86-29762
Analytical investigation of rotor wake formation and geometry
[NASA-CR-177032] p 693 N86-29768
Experimental results of the control of a vortical flow by tangential blowing
[NASA-CR-176932] p 742 N86-30094

## W

**WAKES**
Experimental results of the noise radiation of propellers in non-uniform flows
[AIAA PAPER 86-1928] p 751 A86-45419
Wing loads induced by a propeller wake
[AIAA PAPER 86-1967] p 711 A86-45450
Motion and interaction of decaying trailing vortices in spanwise shear wind
[NASA-TP-2599] p 687 N86-29762
Wake-passing in a turbine rotor cascade
p 741 N86-29830
Unsteady design-point flow phenomena in transonic compressors
[NASA-CR-176879] p 722 N86-30730

**WALL FLOW**
The noise emitted by turbulent jets in close proximity to solid surfaces
[AIAA PAPER 86-1869] p 755 A86-45489
Adaptive wall wind tunnels: A selected, annotated bibliography
[NASA-TM-87639] p 731 N86-29871

**WALL JETS**
An investigation of turbulence mechanisms in V/STOL upwash flow fields
[AD-A166286] p 694 N86-29782

**WALL PRESSURE**
Fluctuations of wall pressure in the interacting region of oblique shock wave and turbulent boundary layer
p 688 A86-43514

**WALL TEMPERATURE**
Measurements of fluctuations of surface heat transfer rate in the interacting region of oblique shock wave and turbulent boundary layer p 688 A86-43512

**WARNING SYSTEMS**
Sniffing out trouble p 699 A86-45757
LLWAS - An integral part of the U.S. wind-shear safety programme p 746 A86-46138
Wind-shear detection - A report on the first such airborne warning device to be commercially certified
p 718 A86-46139
Development of airborne electric field and lightning detection instrumentation for aviation safety
[AD-A167342] p 701 N86-30705

**WARPAGE**
Anisotropic wing aeroelastic theories with warping effects p 686 N86-30359

**WAVE FUNCTIONS**
Monopole element at the center of a circular groundplane of arbitrary radius. Volume 1: Theory and results
[AD-A166991] p 744 N86-30908

**WAVE PROPAGATION**
An analysis of bending wave propagation on impact in a rotating fan blade p 736 A86-43534
An experimental and theoretical investigation of the propagation of sound waves through a turbulent boundary layer
[AIAA PAPER 86-1968] p 753 A86-45451

**WAVE REFLECTION**
Development of an impulsive noise source to study the acoustic reflection characteristics of hard-walled wind tunnels
[AIAA PAPER 86-1887] p 755 A86-45500
Acoustic reflection contamination measurements in the 16-foot NASA Langley Transonic Wind Tunnel
[AIAA PAPER 86-1888] p 755 A86-45501

**WEAPON SYSTEMS**
Generic integrated maintenance diagnostics
p 685 A86-44422
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764

**WEAPONS DELIVERY**
A simulation of an integrated flight control/air-ground cannon firing system
[ONERA, TP NO. 1986-31] p 725 A86-46173

**WEATHER FORECASTING**
Forecasting for civil aviation. II p 746 A86-44380
Aviation weather hazards: FAA (Federal Aviation Administration) system for disseminating severe weather warnings to pilots
[PB86-195070] p 702 N86-30707

**WEDGE FLOW**
Unfolding of degenerate Hopf bifurcation for supersonic flow past a pitching wedge p 725 A86-46456

**WEDGES**
Unified supersonic/hypersonic similitude for oscillating wedges and plane ogives p 689 A86-44880

**WEIGHT ANALYSIS**
Rapid sizing method for airplanes p 708 A86-44887

**WEIGHT REDUCTION**
Study of new flight test techniques [NASA-CR-176952] p 714 N86-29812
Structural optimization programs and methods --- aircraft weight reduction p 715 N86-30655
Recent results on the weight minimization of panels with a flutter speed constraint p 715 N86-30660

**WESTLAND AIRCRAFT**
The black box. Silence is silver, speech is golden [ESA-86-97394] p 702 N86-30706

**WIND SHEAR**
Optimal take-off trajectories in the presence of windshear p 708 A86-44386
LLWAS - An integral part of the U.S. wind-shear safety programme p 746 A86-46138
Wind-shear detection - A report on the first such airborne warning device to be commercially certified p 718 A86-46139
The physical and empirical basis for a specific clear-air turbulence risk index [NASA-CR-3971] p 746 N86-30285

**WIND TUNNEL APPARATUS**
A numerical analysis for vertical gust field induced by gust generator p 727 N86-30637

**WIND TUNNEL CALIBRATION**
Correlation of transonic-cone preston-tube data and skin friction [NASA-CR-176902] p 693 N86-29771
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system [AD-A166888] p 698 N86-30700

**WIND TUNNEL TESTS**
NASA's Langley Center making gains in advanced technology projects p 686 A86-45065
An experimental investigation of wing tip turbulence with applications to aerosound [AIAA PAPER 86-1916] p 691 A86-45413
Counter-rotating propeller noise directivity and trends [AIAA PAPER 86-1927] p 751 A86-45418
Pusher propeller noise directivity and trends [AIAA PAPER 86-1929] p 751 A86-45420
Effect of a wind tunnel on the acoustic field from various aeroacoustic sources [AIAA PAPER 86-1897] p 756 A86-45507
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip [NASA-CR-177110] p 693 N86-29766
Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees [NASA-CR-176962] p 726 N86-29865
Adaptive wall wind tunnels: A selected, annotated bibliography [NASA-TM-87639] p 731 N86-29871
Computations and turbulent flow modeling in support of helicopter rotor technology [NASA-CR-177095] p 742 N86-30090
Experimental results of the control of a vortical flow by tangential blowing [NASA-CR-176932] p 742 N86-30094
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 728 N86-30643
NLR experience in the application of active flutter suppression and gust load alleviation, applied to a wind tunnel model p 728 N86-30649
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft [NASA-CR-176999] p 729 N86-30736
Aeroelastic considerations for torsionally soft rotors [NASA-TM-87687] p 745 N86-31070

**WIND TUNNEL WALLS**
Effect of a wind tunnel on the acoustic field from various aeroacoustic sources [AIAA PAPER 86-1897] p 756 A86-45507
Adaptive wall wind tunnels: A selected, annotated bibliography [NASA-TM-87639] p 731 N86-29871

**WIND TUNNELS**
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study [NASA-TP-2563] p 757 N86-31337

**WIND TURBINES**
Dynamic stall - The case of the vertical axis wind turbine p 748 A86-44150

**WING CAMBER**
Influence of airfoil camber on convected gust interaction noise [AIAA PAPER 86-1873] p 755 A86-45493

**WING FLOW METHOD TESTS**
Spiral vortex flow over a swept-back wing p 691 A86-46004

**WING LOADING**
Wing loads induced by a propeller wake [AIAA PAPER 86-1967] p 711 A86-45450
Influence of airfoil camber on convected gust interaction noise [AIAA PAPER 86-1873] p 755 A86-45493
Aerodynamics via acoustics - Application of acoustic formulas for aerodynamic calculations [AIAA PAPER 86-1877] p 691 A86-45494
Vortex sheet modeling with higher order curved panels [NASA-CR-176971] p 693 N86-29770
Application of transonic unsteady methods for calculation of flutter airloads p 727 N86-30630

**WING OSCILLATIONS**
Transonic aeroelastic analysis of the B-1 wing [AIAA PAPER 85-0690] p 708 A86-44886
The role of structural and aerodynamic damping on the aeroelastic behavior of wings p 708 A86-44894
Calculation of three-dimensional transonic potential flows by a field panel method --- oscillating wings p 695 N86-30629
An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 695 N86-30633
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity p 696 N86-30638
Anisotropic wing aeroelastic theories with warping effects p 696 N86-30659

**WING PANELS**
Recent results on the weight minimization of panels with a flutter speed constraint p 715 N86-30660

**WING PLANFORMS**
Spiral vortex flow over a swept-back wing p 691 A86-46004
Transonic equivalent strip method for aeroelastic applications p 695 N86-30628

**WING PROFILES**
Calculation of the potential flow around wing profiles with the aid of a continuously differentiable vortex distribution p 689 A86-44979
Broad band noise from an isolated two dimensional airfoil [AIAA PAPER 86-1948] p 752 A86-45435
Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow p 695 N86-30632

**WING TIP VORTICES**
The wing tip vortex system in a starting flow p 690 A86-45190
An experimental investigation of wing tip turbulence with applications to aerosound [AIAA PAPER 86-1916] p 691 A86-45413
Mid-field and far-field calculations of Blade-Vortex Interactions [AIAA PAPER 86-1854] p 753 A86-45476
Concepts for reduction of blade-vortex interaction noise [AIAA PAPER 86-1855] p 753 A86-45477

**WINGLETS**
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 716 N86-30678

**WINGS**
An experimental investigation of reducing advanced turboprop cabin noise by wing shielding [AIAA PAPER 86-1966] p 711 A86-45449
CFRP-wing for the Alpha jet p 686 A86-46199
Transonic Navier-Stokes wing solution using a zonal approach. Part 1: Solution methodology and code validation [NASA-TM-88248] p 692 N86-29765
An investigation of tip planform influence on the aerodynamic load characteristics of a semi-span, unswept wing and wing-tip [NASA-CR-177110] p 693 N86-29766
Analytical investigation of rotor wake formation and geometry [NASA-CR-177032] p 693 N86-29768
Flight control system development and flight test experience with the F-111 mission adaptive wing aircraft [NASA-TM-88265] p 714 N86-29813
Aeroelastic wind tunnel similarity theory for anisotropic aircraft wings p 728 N86-30643
Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 716 N86-30678

**WIRE WINDING**
Study of new flight test techniques [NASA-CR-176952] p 714 N86-29812

**WORKLOADS (PSYCHOPHYSIOLOGY)**
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems [NASA-CR-176942] p 714 N86-29811

**WROUGHT ALLOYS**
Superalloy component durability enhancements p 739 A86-46562

## X

**X WING ROTORS**
X-wing rotor systems test vehicle scheduled for flight in October p 707 A86-44001

**X-29 AIRCRAFT**
X-29 initial flight test results p 709 A86-44942

**XV-15 AIRCRAFT**
The XV-15 Tilt-Rotor flight-test program p 709 A86-44938
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download [NASA-CR-176970] p 693 N86-29769

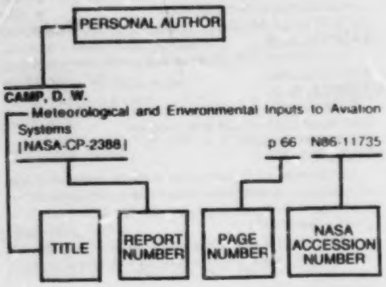
## Y

**YIELD STRENGTH**
The influence of slow growth and net section yielding on the residual strength of stiffened structure p 737 A86-43793

[illegible]

# PERSONAL AUTHOR INDEX

### Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABARBANEL, S. S.**
Impact of supercomputers on the next decade of computational fluid dynamics p 740 A86-46788

**ABE, N.**
Disturbance attenuation by a frequency-shaped linear-quadratic-regulator method p 725 A86-46453

**ABELKIS, P. R.**
Continuing structural integrity program for transport aircraft p 736 A86-43789

**ABRAHAMSON, A. L.**
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482
Acoustic treatment of the NASA Langley 4- by 7-meter tunnel: A feasibility study
[NASA-TP-2563] p 757 N86-31337

**ABU-MOSTAFA, A. S.**
Correlation of transonic-cone preston-tube data and skin friction
[NASA-CR-176902] p 693 N86-29771

**ADAMS, G. D.**
Engineering performance evaluation of small community airport microwave landing system (TI-model) at Philadelphia International Airport Runway 17
[FAA/PM-86/24] p 704 N86-29802

**ADAMS, R. J.**
Investigation of hazards of helicopter operations and root causes of helicopter accidents
[FAA/PM-86/28] p 700 N86-29796

**ADAMS, W. M.**
Development of a flutter suppression control law by use of linear quadratic Gaussian and constrained optimization design techniques p 728 N86-30647

**AGGARWAL, J. K.**

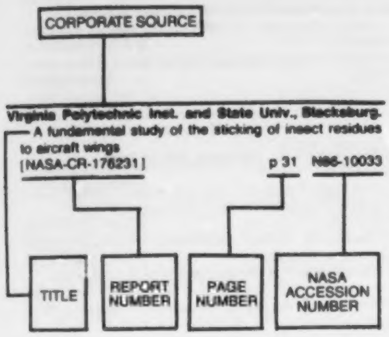
# CORPORATE SOURCE INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 207)* December 1986

## Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
Analogue signal conditioning for flight test instrumentation
[AGARD-AG-160-VOL-17] p 719 N86-29816
Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems
[AGARD-LS-144] p 702 N86-30708
Crashworthiness of airframes
[AGARD-R-737] p 702 N86-30709
The influence of large-scale computing on aircraft structural design
[AGARD-R-726] p 717 N86-30726
Store separation flight testing
[AGARD-AG-300-VOL-5] p 717 N86-30727
Aircraft response to turbulence
[AGARD-R-738] p 729 N86-30739
Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741
Determination of antennae patterns and radar reflection characteristics of aircraft
[AGARD-AG-300-VOL-4] p 744 N86-30931

**Aerojet Electrosystems Co., Azusa, Calif.**
Design, development and integrate/install an airborne remote instrumentation system (AIREYE)
[AD-A166755] p 719 N86-30728

**Aeronautical Research Associates of Princeton, Inc., N. J.**
A fundamental study of drag and an assessment of conventional drag-due-to-lift reduction devices
[NASA-CR-4004] p 745 N86-30999

**Aeronautical Research Inst. of Sweden, Bromma.**
High resolution solutions of the Euler equations for vortex flows p 692 A86-46793

**Aeronautical Systems Div., Wright-Patterson AFB, Ohio.**
Airborne navigation remote map reader evaluation
[AD-A166975] p 719 N86-30729

**Aerospace Medical Research Labs., Wright-Patterson AFB, Ohio.**
A modification of the H-133 ground communications headset for use in intense noise environments
[AD-A166981] p 744 N86-30907

**Air Command and Staff Coll., Maxwell AFB, Ala.**
The search for an advanced fighter: A history from the XF-108 to the advanced tactical fighter
[AD-A166724] p 687 N86-29764
Will the USAF need ground-based air traffic control radar in the year 2000?
[AD-A166504] p 704 N86-29805

**Air Force Academy, Colo.**
Advanced laser based inertial instrument development
[AD-A166307] p 742 N86-30128

**Air Force Flight Test Center, Edwards AFB, Calif.**
X-29 initial flight test results p 709 A86-44942

**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**
Improving the interpretability of an aircraft attitude indicator
[AD-A166329] p 719 N86-29817

**Air Force Systems Command, Wright-Patterson AFB, Ohio.**
Introduction to the recent developments of China's civil aviation
[AD-A166194] p 687 N86-29763
International Aviation (selected articles)
[AD-A166748] p 687 N86-30690
Liquid hydrogen fueled passenger aircraft
[AD-A166229] p 717 N86-30724

**Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.**
Introduction to robust multivariable control
[AD-A165891] p 727 N86-29869
A review of aeroelastic research at the Flight Dynamics Laboratory p 727 N86-30642
Electrostatic hazards of urethane packed fuel tanks
[AD-A166803] p 717 N86-30725
The use of a pyrochemiluminescent nitrogen analyzer as a capillary GC (Gas Chromatograph) detector
[AD-A166597] p 735 N86-30821
Fiscal year 1987 technical objective document
[AD-A166659] p 758 N86-31454

**Akron Univ., Ohio.**
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 738 A86-45256
Jet fuel viscosity at low temperatures with notes on n-alkaline crystals
[NASA-CR-174911] p 701 N86-30022

**Analysis Group, Inc., Washington, D.C.**
Proceedings of Fuel Safety Workshop
[DOT/FAA/PM-86/13] p 733 N86-30007

**Arizona State Univ., Tempe.**
Transonic equivalent strip method for aeroelastic applications p 695 N86-30628

**Arizona Univ., Tucson.**
Noise generated by convected gusts interacting with swept airfoil cascades
[AIAA PAPER 86-1872] p 755 A86-45492
Influence of airfoil camber on convected gust interaction noise
[AIAA PAPER 86-1873] p 755 A86-45493

**Army Aviation Research and Development Command, Moffett Field, Calif.**
Identification and verification of frequency-domain models for XV-15 tilt-rotor aircraft dynamics in cruising flight p 713 A86-46461

**Army Propulsion Lab., Cleveland, Ohio.**
Fatigue life analysis of a turboprop reduction gearbox
[ASME PAPER 85-DET-10] p 738 A86-45256

**Arnold Engineering Development Center, Arnold Air Force Station, Tenn.**
Air-on demonstration of the AEDC PWT tunnel 16T captive trajectory support system
[AD-A166888] p 698 N86-30700
Aircraft transparency testing: Artificial birds
[AD-A166832] p 701 N86-30704

**Aviation Fuel Safety Co., Chelmsford, Mass.**
Amine-CO2 adducts as aviation fuel gelling agents
p 701 N86-30020

## B

**Bell Telephone Labs., Inc., Whippany, N. J.**
Prediction of sound fields in cavities using boundary element methods
[AIAA PAPER 86-1864] p 754 A86-45484

**Bio-Dynamics Research and Development Corp., Eugene, Oreg.**
Feasibility study for ergonomic analysis and design of future helicopter cockpit systems
[NASA-CR-176942] p 714 N86-29811

**Bionetics Corp., Hampton, Va.**
Advanced turboprop aircraft noise annoyance - A review of recent NASA research
[AIAA PAPER 86-1959] p 752 A86-45444

**Boeing Co., Seattle, Wash.**
Current design procedures for minimizing post crash fire hazards p 700 N86-30019

**British Aerospace Dynamics Group, Hatfield (England).**
The choice of techniques used for flight flutter clearance with particular reference to the BAe 146 and BAe 125
p 728 N86-30644

## C

**California Polytechnic State Univ., San Luis Obispo.**
An experimental and analytical method for approximate determination of the tilt rotor research aircraft rotor/wing download
[NASA-CR-176970] p 693 N86-29769
Flight determination of the aerodynamic stability and control characteristics of the NASA SGS 1-36 sailplane in the conventional and deep stall angles-of-attack of between -5 and 75 degrees
[NASA-CR-176962] p 726 N86-29865
The performance evaluation of a jet flap on an advanced supersonic harrier
[NASA-CR-179653] p 716 N86-30722
Longitudinal stability and control derivatives obtained from flight data of a PA-30 aircraft
[NASA-CR-176999] p 729 N86-30736
A survey of handling qualities criteria and their applications to high performance aircraft
[NASA-CR-179654] p 729 N86-30738

**California Univ., Berkeley.**
A new look at arbitrary motion unsteady aerodynamics and its application to rotary-wing aeroelasticity
p 696 N86-30638

**California Univ., Davis.**
Identification of pilot-vehicle dynamics from in-flight tracking data p 725 A86-46459

**California Univ., Los Angeles.**
An experimental investigation of wing tip turbulence with applications to aerosound
[AIAA PAPER 86-1918] p 691 A86-45413
A.I.-based real-time support for high performance aircraft operations
[NASA-CR-176906] p 716 N86-30718

**Calspan Field Services, Inc., Arnold AFS, Tenn.**
Aircraft transparency testing: Artificial birds
[AD-A166832] p 701 N86-30704

**Cambridge Acoustical Associates, Inc., Mass.**
Structureborne noise investigations of a twin engine aircraft
[AIAA PAPER 86-1905] p 710 A86-45406

**Cincinnati Univ., Ohio.**
Flap-lag-torsional dynamics of helicopter rotor blades in forward flight
[NASA-CR-176976] p 714 N86-29810

**Colorado Univ., Boulder.**
Numerical studies of porous airfoils in transonic flow
[NASA-CR-179655] p 697 N86-30696

**Computer Technology Associates, Inc., Englewood, Colo.**
Operations concept for the TCCC (Tower Control Computer Complex) man-machine interface
[AD-A166899] p 705 N86-30714

**Comtek, Grafton, Va.**
A feasibility study on the numerical modeling of interior noise fields
[AIAA PAPER 86-1862] p 754 A86-45482
**Conoco, Inc., Ponca City, Okla.**
Olefin polymers as jet fuel antimist additives
p 734 N86-30016
**Cornell Univ., Ithaca, N.Y.**
Helicopter tail rotor noise
[AIAA PAPER 86-1900] p 750 A86-45401
Aerodynamics of engine-airframe interaction
[NASA-CR-179657] p 697 N86-30697
**Cranfield Inst. of Tech., Bedford (England).**
Structural optimization programs and methods
p 715 N86-30655

## D

**Dayton Univ., Ohio.**
The physical and empirical basis for a specific clear-air turbulence risk index
[NASA-CR-3971] p 746 N86-30285
Advances in the study of the mechanical behavior of materials
[AD-A164656] p 735 N86-30838
**Delta Air Lines, Inc., Atlanta, Ga.**
Optimal take-off trajectories in the presence of windshear p 708 A86-44386
**Department of the Air Force, Washington, D.C.**
Self-retained platform cooling plate for turbine vane
[AD-D012218] p 721 N86-29822
**Detroit Diesel Allison, Indianapolis, Ind.**
Feasibility study for convertible engine torque converter

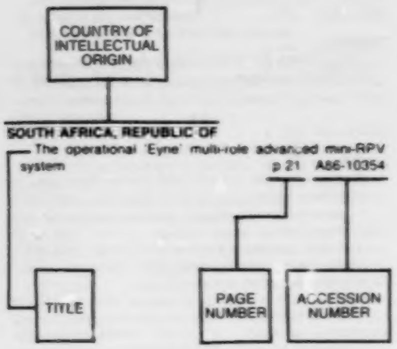
# FOREIGN TECHNOLOGY INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 207)* December 1986

## Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

A rationale for the safe operation of an aircraft fleet having known cracks in primary structure p 737 A86-43792

Sinusoidal disturbance rejection with application to helicopter flight data estimation p 747 A86-44505

## B

**BELGIUM**

Dynamic analysis of structures with flexible rotors p 722 N86-30664

Numerical Techniques for Viscous Flow Calculations in Turbomachinery Bladings [VKI-LS-1986-02] p 744 N86-30988

## C

**CANADA**

Dynamic stall - The case of the vertical axis wind turbine p 748 A86-44150

A graphic terminal for air traffic control of Canadian military airports p 703 A86-44399

Automatic Inflation Modulation (A.I.M.) parachute up-date p 698 A86-44761

Fiber optic sensors for flexure measurement of aircraft structures p 739 A86-46135

Digital control loading and motion - The final word? p 732 A86-46149

Pressure drop and heat transfer characteristics of circular and oblong low aspect ratio pin fins p 741 N86-29827

**CHINA, PEOPLE'S REPUBLIC OF**

Application of adaptive control to aircraft systems p 746 A86-43476

Application of rotor induced velocity field of the vortex theory to the study of stability and controllability of helicopter with hingeless rotor p 705 A86-43477

Identification and estimation of the random error models for inertial accelerometer and baro-altimeter p 717 A86-43481

An optimal parameter estimation method compatible with stable parameter prediction in time domain p 746 A86-434[illegible]

An inertial navigation system with single-axis stabilization p 702 A86-43[illegible]

A second-order theory for three-dimensional unsteady flows and its application to thin wings with angle of attack at supersonic and hypersonic speeds p 687 A86-43485

Improvement of servo systems for flight simulator p 706 A86-43487

A survey of multiple targets tracking technique p 735 A86-43489

Application of harmonic analysis method to research on rotor airloads p 706 A86-43490

Stability analysis of composite stiffened layer plates under compression p 735 A86-43495

Buckling and initial post buckling analysis of composite panels under axial compression p 735 A86-43496

Controllability of redundant flight control system and pressure equalization of redundant servo actuators p 723 A86-43497

Design and research of aircraft parameter-adaptive lateral command augmentation systems p 723 A86-43498

Some problems in the finite-difference computation of three-dimensional transonic flows p 687 A86-43501

Sensitivity analysis of parameters in solving inverse problem of structural dynamics p 736 A86-43502

Optimization of stiffened panels under compression p 739 A86-45762

A fast shape descriptor p 748 A86-46377

Numerical calculations of inviscid transonic flows over wings p 692 A86-46415

Incremental and iterative methods for solving fluid/structure interaction problems p 740 A86-47011

Introduction to the recent developments of China's civil aviation [AD-A166194] p 687 N86-29763

A numerical analysis for vertical gust field induced by gust generator p 727 N86-30637

Experimental transonic pressure distributions of a flexible wing-aileron model and comparisons with results of several theoretical methods p 696 N86-30639

Calculation of the load distribution, aerodynamic derivatives and dynamic characteristics of quasi-static elastic aircraft p 696 N86-30640

Control law synthesis for gust load alleviation using linear quadratic Gaussian theory p 728 N86-30651

Determination of natural vibration properties of a wing with winglet by experimental mode synthesis technique p 716 N86-30678

International Aviation (selected articles) [AD-A166748] p 687 N86-30690

Liquid hydrogen fueled passenger aircraft [AD-A166229] p 717 N86-30724

## F

**FRANCE**

A simple crack closure model for predicting fatigue crack growth under flight simulation loading p 737 A86-43796

Calculation of transonic rotor noise using a frequency domain formulation [AIAA PAPER 86-1901] p 750 A86-45402

Trends in civil avionics for the near future p 718 A86-46141

ILS goal - Automatic landings, safety p 703 A86-46142

Viscous-inviscid interaction solvers and computation of highly separated flows [ONERA, TP NO. 1986-4] p 691 A86-46152

The methods implemented at ONERA to improve airplane ground vibration tests [ONERA, TP NO. 1986-8] p 713 A86-46153

Requirements and recommendations for the development of theoretical codes and experimental facilities in the near future [ONERA, TP NO. 1986-10] p 731 A86-46155

Modeling three-dimensional flows in terms of viscous-inviscid interaction by means of the MSZ method [ONERA, TP NO. 1986-29] p 692 A86-46171

A simulation of an integrated flight control/air-ground cannon firing system [ONERA, TP NO. 1986-31] p 725 A86-46173

New modal identification methods applied to aeronautical structures [ONERA, TP NO. 1986-35] p 713 A86-46177

10 years of rotor flows studies at ONERA - State of the art and future studies [ONERA, TP NO. 1986-49] p 692 A86-46185

Comparison of angular and metric guidance laws for tactical missiles p 726 A86-46469

Influence of the angle of attack and flutter on the lift of a supercritical wing. Comparison between theory and experiment [ONERA-RT-24/3064-RY-044-R] p 695 N86-29786

Analogue signal conditioning for flight test instrumentation [AGARD-AG-160-VOL-17] p 719 N86-29816

Cooling techniques for turbojet pre-heater channels p 741 N86-29847

Ceramic heat exchangers for gas turbines or turbojet engines p 742 N86-29858

Preliminary instrumentation for aeroelastic tests at the compressor level [ONERA-RT-95/7108-RY-054-R] p 743 N86-30219

Interaction between EMP (Electromagnetic Pulse), lightning and static electricity with aircraft and missile avionics systems [AGARD-LS-144] p 702 N86-30708

The influence of large-scale computing on aircraft structural design [AGARD-R-726] p 717 N86-30726

Aircraft response to turbulence [AGARD-R-738] p 729 N86-30739

## G

**GERMANY,FEDERAL REPUBLIC OF**

Airbus Industrie A310 and A300-600 experience with practical applications of damage tolerance design in fuselage primary structure p 707 A86-43787

Maintenance system by means of damage tolerance principle p 736 A86-43791

The optimization of seaplanes - New chances and requirements regarding flying boats p 707 A86-43930

Flow of real fluids p 737 A86-44801

The reverse-flow theorem for transonic flow p 688 A86-44802

On aerodynamic sound generation by airfoil-vortex interaction p 688 A86-44803

On slender vortices p 689 A86-44810

Tornado high speed terrain following testing in mountainous terrain and bad weather p 710 A86-44945

Calculation of the potential flow around wing profiles with the aid of a continuously differentiable vortex distribution p 689 A86-44979

Investigation of the ignition characteristics of hydrogen/air mixtures in the case of combustion induced by oblique shocks p 732 A86-45185

The classical streamline curvature method in the supersonic range - A numerically ill-posed boundary value problem p 690 A86-45189

The effect on radiated noise of non-zero propeller rotational plane attitude [AIAA PAPER 86-1926] p 750 A86-45417

Experimental results of the noise radiation of propellers in non-uniform flows [AIAA PAPER 86-1928] p 751 A86-45419

Aerodynamic technologies for general aviation aircraft p 713 A86-46198

CFRP-wing for the Alpha jet p 686 A86-46199

Transient thermal behaviour of a compressor rotor with ventilation: Test results under simulated engine conditions p 741 N86-29856

Effect of film cooling on the aerodynamic performance of a turbine cascade p 742 N86-29859

Aerodynamic effect of coolant ejection in the rear part of transonic rotor blades p 742 N86-29861

Active flutter suppression on a delta wing model structure
[DFVLR-FB-86-01] p 727 N86-29870

The Second International Symposium on Aeroelasticity and Structural Dynamics
[DGLR-85-02] p 687 N86-30627

Calculation of three-dimensional transonic potential flows by a field panel method p 695 N86-30629

Application of transonic unsteady methods for calculation of flutter airloads p 727 N86-30630

Steady and unsteady pressure distribution on various profiles in separated subsonic and transonic flow p 695 N86-30632

An improved potential gradient method for the calculation of unsteady aerodynamic pressures on oscillating wings in supersonic flow p 695 N86-30633

Theoretical flutter investigations on a plane cascade in incompressible flow p 727 N86-30635

Application of unsteady wing collocation methods to cascades in subsonic flow p 696 N86-30636

The application of practical optimization techniques in the preliminary structural design of a forward-swept wing p 715 N86-30654

Variation of anisotropic behavior in structural optimization p 715 N86-30656

Effects of anisotropic design on the static aeroelasticity of a swept wing p 687 N86-30661

Aeroelastic problems and structural design of a tailless Carbon Fiber Composite (CFC) sailplane p 715 N86-30662

Simulation of aircraft taxi testing on the AGILE shaker test facility p 731 N86-30663

Structural dynamic aspects of rotor nodal isolation p 715 N86-30665

Advances in ground vibration testing using a combination of phase resonance and phase separation methods p 743 N86-30669

Reconstruction of forcing functions based on measured structural responses p 732 N86-30684

Gust load prediction and alleviation on a fighter aircraft
[AGARD-R-728] p 729 N86-30741

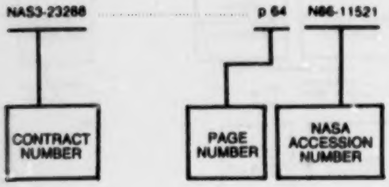
Assessing the effects of delaminations on the postbuckling strength of CRFP panels p 743 N86-30781

# CONTRACT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 207)* December 1986

### Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

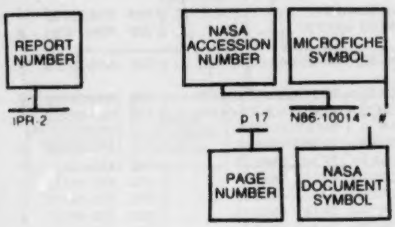
# REPORT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 207)* December 1986

### Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

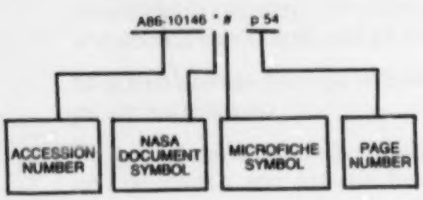
# ACCESSION NUMBER INDEX

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26:1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA – Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

## FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign–includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.
